PUS IN THE SINUSES—I have a mare in bad shape. This mare's nose commenced to run in July, a thick white slime, but there was no bad effects from it and in January this side stopped running and the other side started to run. She has a good appetite for all feed. The side that run first is enlarged from the eye down about three inches, and when this side began to run she began to make a noise like a windbroken horse, mostly from going uphill. I took her to a veterinarian the first of this month. He said she had "nasal gleet"; he gave her creosote, potash and something else but it did no good, only stopped the discharge at the nostril; at times she will stand and turn her head from one side to the other as though in slight pain, but I think this is from the colt kicking, as she was bred early and hasn't done anything yet; has lost at least 200 pounds. Now if you can give any information about this mare it will be highly appreciated. — Missouri Subscriber.

REPLY:—One would infer from your description that there was a collection of pus in the cavities of the head. These should be opened so the pus may escape and give opportunity to treat the diseased membranes. We fear until this is done you will experience no improvement. Your veterinarian, if a graduate, should be able to take care of it for you.

BARLEY AS A FEED—I would like to inquire about feeding barley whether it is a feed for hogs, cattle, mules or horses, how it is fed and in what amounts, whether it is best to have it ground and mixed with some other feed and what feed—oats, corn, bran, middlings or shipstuff?—Subscriber.

REPLY:—Barley can be used as a feed for either hogs, cattle, sheep, horses or mules, and can be fed under the same general rules as when corn is used. The feeding value is verly nearly as high as that of corn and when mixed with corn the variety of feed produces beneficial results with the animal. Barley should be fed with some other grain. It can be fed with corn, oats, wheat, rye, bran or middlings. It is preferably fed ground with one of the above mentioned feeds. When fed to hogs it should always be ground or rolled and mixed with some other feed. While it can be fed in larger amounts than one-half the ration it is preferably not fed in greater proportions than one-half. Barley is considered one of the best feeds for making a high quality of meat both as regards firmness and flavor.—Purdue University Experiment Station, F. G. King.

SLOW JACK—I have a jack that served mares well at the beginning of last season but gradually got slower until we had an awful time with him

JACKS, JENNETS AND DRAFT HORSES AT
PUBLIC SALE MARCH 12

20 Jacks and Jennets—All blacks with light points, the jacks 1 to 4 years old and the jennets 4 to 8 years. This is a desirable class of stock, all blocky, heavy boned, and the jennets all bred to the famous herd jack, Ben Hur, a 1,200-pound, 16-hand jack.

10 Draft and Road Horses, including breeding stock and matched pairs of work animals.

8 Good Mules, all broke; some matched pairs.

Send for catalog and any information desired, and mention the American Breeder.

J. E. CLARY & SONS :-: :-: SHERIDAN, MO.

R. L. Harriman, Auctioneer.

GEO. M. DYER, O'FALLON, MO.
St Charles County.

JACKS AND PERCHERON STALLIONS

Best lot of jacks ever offered at Quiet Glenn; the big kind with herd headers among them a specialty. Buy this fall, get choice and save money. — **G. M. SCOTT, Rea, Andrew County, Mo.**

before the season was over. He is a very timid jack and sees everything. Could you suggest anything that would help him? We usually tried to make two services a day with him.—Iowa Subscriber.

REPLY:—Build a barn for this jack perfectly dark; stop up all the holes and put him in it now, so that he will be used to it by the breeding season. Make it plenty large enough so that you can make a pit in it; tease your mare outside; bring the mare in gently; put her in this pit and close the door; do not permit any men or dogs to come in except one man who will stand in front of the mare and out of sight of the jack. Do not let him see the man. Be very gentle with this jack; pet him as much as you can every time you go about him; give him a chew of tobacco, a lump of sugar or a piece of carrot, or anything that he likes, so that he is always glad to see you. Never speak harshly to him. Take the bridle off and use only the halter. If you have difficulty in holding him, fix a post in the ground solid so that you can wrap the rope around it, and hold him. Do not try to serve too many mares; one good service a day, or perhaps two services one day and one the next. Reject all doubtful mares so that your services will make you money; let them go somewhere else. While you are putting the mare in the pit if he does not seem to be getting anxious, spend a little time fixing the mare, and getting ready, so that he will have a little more time to get ready. Do not permit any noise around the barn that he can hear. Do not try to breed any mares that offer any resistance.

FAILS TO CONCEIVE—I have a Jersey heifer 19 months that I cannot get with calf. The bull has served her at least six times but she still keeps coming regularly every twenty-one days. She got to a large bull when she was but 11 months old and she nearly died. The bull I have now is a large one. Do you think it is from the large bull or is it from the large bull that bred her when she was too young, for it nearly killed her. She is fat and feeling fine and will weigh about 700 pounds. She is a registered heifer and I would like to get her started to breeding. Do you think that a bull about her size would be more apt to get her in foal? Any information along this line will be highly appreciated.—Iowa Subscriber.

REPLY:—It is quite likely the difficulty dates from the early service and you should have a competent veterinarian examine this animal with a view of learning just where the trouble is. Until that is done all will be guess work and verly likely disappointment.

A NEW IMPREGNATOR—I understand that a Texas man has invented a new impregnator that is an arrangement fastened on to the mare with some kind of a blanket so that when the horse dismounts the semen falls into a vessel. He states in the advertisement that it is not necessary to use capsules or have a dark room. Is it necessary to have a horse dismount before he ejaculates to get the semen into this receptacle, or how is it managed?—Texas Subscriber.

REPLY:—The writer has seen this new arrangement and had it explained to him fully. A cercival plug is put in the mare (which has ruined a lot of good stallions); by this method the semen is deposited into the vagina and then it is raked out of the vagina into an attachment on the blanket so that the semen comes in contact with pleny of light and destroys it unless the breeding is done in a dark room. Neither can we understand how they are going to keep the temperature right. We advised the inventor of this new arrangement that he had better save his money; that we did not consider it a success. Those who wish to experiment with this new fangled, doubtful idea can do so. We do not intend to advocate the use of anything that is going to be injurious to breeding stock. Those who care to spend a little time and thought in studying propositions which have been found to be successful, can have good results in artificial breeding.

POSTERIOR PRESENTATION—We had a mare that had a foal that came back feet first. Do you think the same think is likely to happen this spring?—Iowa Subscriber.

REPLY:—In answer to your question will say that it would only be a guess on our part and while an anterior presentation is the usual one, there is nothing abnormal about the one you have experienced.

THOROUGHBRED RECORD—Where can I write to find out if a horse is registered, and his breeding? He is a running horse and has run at Butte, Mont., at the races.—Montana Subscriber.

REPLY:—Get the horse's name, record number and description, and whatever is claimed for him in the way of a pedigree, and send it to W. H. Rowe, Secy. of the Thoroughbred Stud Book, New York City, N. Y. He can tell you whether or not it is all right.

ITCH—I have two horses which have some kind of an itch; they seem to suffer from it quite a bit; when I curry them they almost lie down on me. Their skin seems rather rough and uneven but has no prominent raised places; is mattering quite a bit in some places. What is it? What will cure it? Is it infectious?—Ohio Subscriber.

REPLY:—It would perhaps require an examination with a microscope to positively determine the character of this disease, and you should have such an examination made by your veterinarian. In the event no veterinarian is available try the following: Alcohol 16 ounces, lysol two drams, water sufficient to make one quart. Place all these ingredients together in a bottle, shake well and apply to the affected parts with a soft cloth once a day, rubbing in well. If the local conditions do not improve, write us again.

MORGAN HORSES—I saw in your paper a picture of a Morgan horse. Could you kindly write me where a good Morgan stallion could be gotten, as I like the Morgan horse.—Colorado Subscriber.

REPLY:—The American Breeder has one or two regular advertisers among the Morgan breeders. There are doubtless others who have meritorious animals who very profitably could keep their names before our readers the year around.

PERCHERON PEDIGREE—Will you give me the color and pedigree of the Percheron stallion, Gypsie 70831 (72710)?—Nebraska Subscriber.

REPLY:—Black; star, strip; hind feet white; imported by North & Robinson, Grand Island, Neb. Volume 14 of the Percheron Society Stud Book does not give the pedigree. You can write to Wayne Dinsmore, Secy. of the Percheron Society of America for his pedigree in full.

CONTRACTED TENDONS—I have a 3-year-old jack that is inclined to walk on his toes on hind legs. I keep his heels cut close but they do not always touch ground in walking. Can you give any treatment?—Kansas Subscriber.

REPLY:—Contracted tendons in jacks and mules is most often due to rheumatic involvement and is very difficult to overcome. It might be that a good vesicant along the cause of the tendons would aid in checking the difficulty, but before acting you should have a competent veterinarian give his a personal examination.

40 HEAD

Jacks and jennets. Write us for prices. CORSON BROS., POTTER, ATCHISON COUNTY, KANSAS.

Registering Jack Stock

In order to increase the size and quality of jack stock, it is necessary to use the best animal available and properly care for the progeny. In order to know what ancestors have been of certain conformation, it is necessary to keep a record. A registry of this kind was started in 1908, known as the Standard Jack and Jennet Registry of America. The object was to register male and female animals filling certain measurements. These animals are the foundation stock.

It has been found necessary for all beasts of burden to be of a well proportioned type. The rules of this association, drawn with a view to developing a well proportioned type, have met with the approval of jack breeders. This record association now has more living animals recorded than any other jack registry in the world, and is growing rapidly. It was incorporated a few months ago and the directors elected to manage its affairs are breeders who own about a thousand jennets altogether. These men expect to continue in the business and are asking the support of the jack breeders in this country.

Everyone interested in jacks should study this subject, as it means an improvement in mule breeding. Jacks are kept for the production of mules. The mule market should be the guide. Indications in the mule market point to a great demand for the large mules with plenty of bone and body. The mule market does not require any special color, although from a color standpoint, the steel gray is the best seller, everything else being equal. The red sorrel is perhaps second. At least, this is what the dealers say, and these men are in a position to know what the market demands. Mule dealers also state that they are not wanting a long legged, spindling mule. They should be of good quality.

The Standard Jack and Jennet Registry of America will not stand open like another record association has done for a quarter of a century, but more stringent rules will go into effect in the near future. Our advice to the owners of jacks and jennets is to send for application blanks at once and register their stock. A little expense will put the breeder in a position to register young stock at a later date. All that are old enough should be registered. The jack buyers of the country are going to demand that stock be registered in this association, because it is founded on the right principles. It has a high class of officers who are engaged in the jack breeding business, and the vast majority of other breeders have confidence in them. It is our opinion that this is the only jack record in the country it is profitable to patronize, and breeders should not fail to get their stock in while they can. Registered stock is worth much more than that which is not recorded. Applications may be had from Wm. E. Morton, secretary, 920 Scarritt Bldg., Kansas City, Mo.

Type of mule raised in Southern France. These are very large, rugged mules out of registered draft mares and sired by registered jacks. These mules as a class are the highest priced mules in the world.

The rules of entry are as follows:

1. Pedigree must give name, color, sex, year foaled in, and name and address of owner.
2. Jacks must measure 58 inches or more from the highest central part of the withers to the ground and measure 62 inches or more around the heart girth in average condition, and have 7 inches or more measurement around the front leg at the smallest place between the ankle and knee (the leg to be normal size).
3. Jennets must measure 56 inches or more from the highest part of the withers to the ground, and measure 60 inches or more around the heart girth in average condition, and have 6¾ inches or more measurement around the front leg at the smallest place between the ankle and knee (the leg to be normal size).
4. Any color admitted, provided they comply with Rules 2 and 3.
5. Young undeveloped jacks and jennets may be registered when their sire and dam are registered in this Registry, provided the sire fills the above measurements. This will make a uniform type.
6. Each application must give exact measurements of foundation stock, so the certificate cannot be handed out with another animal.
7. Each application must be sworn to before a Notary Public or Justice of the Peace.
8. You can give the sire and dam names (barn names) for foundation stock.
9. This Registry will not recognize any other Jack Registry unless the animal meets the requirements of this Registry.
10. The fee for registering Jacks and Jennets in the Standard Jack and Jennet Registry of America shall be **One Dollar to Stockholders and Two Dollars to Non-Stockholders for Each Animal Registered.** The fee for transfers shall be one dollar for each animal transferred. The fee in all cases to accompany the application. Each transfer shall be recorded before the offspring can be registered.

THE BEST MULES.

One frequently hears the expression that sugar mules are the best mules to raise. There was a time when sugar mules, as a class, were the most profitable, but they are not considered the best now days. Cotton mules sell for about $135 a head; sugar mules bring about $225, but of late years there has come into existence a great demand for the big, rugged draft mules. These mules sell for $250 and a great many of them sell for more than $300 each. This is the demand that the breeders should pay more attention to because it brings more money and the chances are that this market demand will grow rapidly.

It is remarkable where the extent to which the big draft mules are being used at the present time, and the great demand for them. The sugar plantations that use this type of animals are not plentiful and this demand will not increase. This type of mules, however, can be used in many other places. The sugar mule is just a cotton mule with more size and finish; practically the same requirements except that the sugar mule must be much larger.

But we wish to emphasize the fact that the mule market is demanding the large, serviceable draft mule with heavy bone and a great bread basket. This demand is not confined to this country exclusively. This type of mules can be exported with profit during these high prices. No breeder should try to raise cotton mules. The market will be full of cotton mules without any effort. Cotton mules will be the result in too many cases where they are trying to raise bigger and better ones. The whole world is asking for larger horses and larger mules, with more substance. One frequently hears jack men especially placing the premium upon the sugar mules and proclaiming them as the best to raise, which is a mistake. The big, rugged draft slaves are the most profitable.

RESPONDS TO OHIO.

To the American Breeder:—Mr. Dad Sprague of Clary County, Ohio, gives the measurements of his big jack and asks if anybody has his equal. I want to say I can match him. Here he is: Giant King, foaled May 29, 1902; black with white points; is 16 hands standard. He hasn't been weighed since he was two years old and weighed then in very common flesh 975 pounds; I don't think it would be any trouble for him to weigh 1,300 or 1,350 pounds if fat. He is at present what you might call poor; 70-inch girth; flank 72 inches; arm 21; knee 16½; below knee 9½; hock 19 inches; below hock 10½; from tip to tip of ears 35 inches. Giant King is a great breeder for both mule and jack colts, and is as prompt to serve both mares and jennets as any man's jack, and as sound as a dollar.—W. L. Garriatt, Smithfield, Henry County, Ky.

GIVES THE JACK HIS DUES.

To the American Breeder:—I am delighted to see to what proportion and quality your paper has grown in so short a time. It is the only paper that I know of that is inclined to give the jack due recognition. I fully agree with you as to the requisites for registration (quality), and not "color and height." The superiority of the Poitou mule demonstrates what quality will produce.—Allen B. Harlan, Maury County, Tenn.

SLOW JACKS.

In the December 20th issue we requested a few of our readers (not to exceed twenty-five) who owned slow jacks to send their names and addresses, as a new remedy had been discovered that had given good results in some cases. We were surprised at the great number of slow jacks in this country, for we received inquiries in large numbers for the medicine, which we were to send them free of charge. This treatment is being used and we hope to give it a thorough trial and advise our readers in a short time what the results of it have been, and specify the medicine in this paper so that our readers can purchase it at their drug stores. We wish to be very careful about advocating any new remedies without first having tried them out.

Cart commonly used for drayage in hilly cities of Spain.

Another breeder who wishes to use the capsule system states that he has a very slow jack and asked if an "emasculator" could not be used on this slow jack, as his idea was that the semen could be taken from the jack. An emasculator is used in castrating animals. This instrument is a good instrument in its place, but we are of the opinion that an emasculator will not be a very good instrument to use on a slow jack.

In the meantime, if any of our readers have any method of encouraging a quicker service with this jack; one that has been tried and found successful, we would be very glad to print it, as it seems to be a burning issue with many breeders.

EIGHT JACKS FOR SALE.

Combining the blood of Autar, Black Giant and Lime Stone Wonder; all black, white points.

Have either a trotting or a coach stallion for sale or will trade for a good Percheron mare or jennets. Must be a good one. These horses are sound and the very best of breeders, but have one too many. **Chas. Wyatt, Petersburg, Pike County, Ind.**

Headquarters for

Mo., Ky., and Tenn. Jacks

Sold singly or in carload lots. I guarantee more bone and more good Jacks and jennets than any breeder or dealer in Missouri. Every one black and from 15 to 16 hands high. Have them of all ages. Thirty-five years doing business with the public, and never had a lawsuit with a customer.

ED. BOEN, LAWSON, MO.
(Lawson is 28 miles from Kansas City.)

JACKS AND MULES

We have 14 jacks from one to six years old; have lots of bone, size and quality; all black with white points.

Also have 128 yearling mules, coming two year old, and 26 mule colts. These mules are from grade draft mares; have lots of bone and width. Only 15 out of the 154 are horse mules, the balance are mare mules. Will sell at reasonable prices. **Scott, Abney & Jenkins, Virden, Macoupin County, Ill.**

JACKS AND JENNETS.

Forty head of Mammoth jacks and jennets for sale. Jacks in age from colts to four years old; in size up to 16 hands. These jacks are all good ones; in this lot are two as good as grows—good enough to head any herd of jennets. I have one of the best herds of jennets in Kentucky. I raise all my own stock and will sell them worth the money. Write for prices today, or better, come and see them. **U. G. Saunders, Flemingsburg, Ky.**

Mammoth Jacks

AND JENNETS

PRICES FROM $250 UP.

14 to 16 hands high.

JOHN HENRY, FAIRFAX, IA.

8 miles west of Cedar Rapids.

REPUBLIC COUNTY JACK FARM

17¼c

6¾ inch Mesh, 26 Inches High

Compare that with what your dealer and catalog houses ask you, 30c, 32½c, 36c for, and mind you every foot of Ottawa fence is sold under a **positive, iron-clad, money back guarantee.** If you don't like it **better** than your money—if **anything** you buy of us is not the **best value you ever saw** for the money **send it back** and we return your money by first mail. Ottawa fence is made from the highest grade of hard, tough, springy wire, **thoroughly galvanized, warranted to stand weather conditions anywhere.**

GUARANTEED TO HOLD

The Ottawa non-slip tie is guaranteed to hold under any and all conditions. It is made by my own patented process, and I know what it will do. If it **ever slips** the least fraction of an inch, take it down, roll it up and send it back—I'll gladly return your money. I've made this same guarantee for years, and not a single rod has ever been returned. The Ottawa Tie **holds forever.**

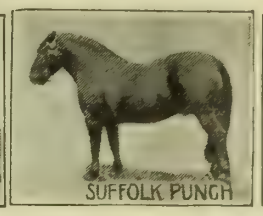
Volume VI. *Kansas City, Missouri, March 20, 1913* *Number 5*



VALUE OF FEED FOR GROWING HORSES.

The above photograph represents a stunted five year old gelding. This horse weighed 1,350 pounds and sold for $140. His general appearance indicates an animal produced on short rations. This means a sacrifice in form as well as in size. He has not filled out as nature intended. A full brother a year younger, not as good at weaning time, has developed into an excellent draft horse, weighing 1,830 pounds, which is worth about $300. These colts were raised by different men in the same community. The point we wish to emphasize is how much did the owner of the above gelding actually save in the few bushels of extra grain that would have made this animal a draft horse? How much has he lost in the selling value of this animal? A few dollars' worth of extra feed in a promising young animal is an excellent investment. Keep them growing so they will develop as nature intended.

Graham Publishing Company, Inc., 225 West Twelfth St., Kansas City, Missouri

Lafayette Stock Farm

We Are Glad to Inform our Many Customers and Interested Buyers that We Have Without Doubt the Largest and Best Selection of

Percheron and Belgian

STALLIONS AND MARES

both imported and American bred, ever offered to the trade, in ages running from three years old on up. The Percherons, blacks and grays in color; Belgians, blacks, roans, sorrels and bays in color.

Type of our Percherons

We can suit any buyer in a horse and price. We don't want the intending buyer to think because we won all the first prizes in France, except one in 1912, nor because we won most of the prizes offered at the International in 1912, that our horses are priced high. We can and will sell as low as any importer can sell them, quality considered, and with a good guarantee. We make terms to suit you.

J. CROUCH & SON, Props.

LAFAYETTE :-: :-: INDIANA

IMPORTED PERCHERONS AND BELGIANS

I have a lot of the best specimens of the two leading breeds. I have personally selected them carefully for big bone, with quality, style, action and breeding, with weight from 1800 to 2200 pounds. I give a gilt edge guarantee, good for two years, with every horse. I am going to sell them down very cheap, considering the quality. Barns are four blocks from A. T. & S. F. depot.

(Stallion Service Books 10c.)

RHEA BROTHERS

ACCLIMATED PERCHERONS

We have 40 head of stallions on hand today. Ages from coming two to five years. The older horses weigh from 1,900 to 2,200 pounds and are not loaded down with fat.

These stallions have been raised in the open fields and are acclimated and will breed from the start. You cannot over-estimate the importance of acclimation—it means much to you.

Our horses have more bone than is usually found among Percherons, and they are clean jointed and sound.

We are offering stallions at very reasonable prices, far below what the same class of horses are usually quoted; but we raise them here on the farm; raise our feed and can afford to sell cheaper than others not so favorably situated.

Every stallion fully guaranteed. Life insurance furnished at cost if desired. If interested in Percherons we ask you to come and see us or write today. References—Packers Nat'l Bank, So. Omaha; Arlington State and First Nat'l Bank of Arlington, and the Citizens State Bank of Blair, Neb.

Arlington is on the main line of C. & N. W. R. R., 34 miles northwest of Omaha, 55 miles north of Lincoln, and eight miles east of Fremont. We have 12 passenger trains every day. *ARLINGTON, NEBRASKA*

PETER HOPLEY & SON,

ATLANTIC and LEWIS, IOWA,

Importers of PERCHERONS and SHIRES

We have been making from one to three importations a year since 1884 of the best stallions and mares that we could find in France and Great Britain. **We have now the best lot of both breeds** of stallions and mares, nearly all two-year-olds, that we have ever had on our farms at one time. **They excel in weight, bone and quality.** We have two-year-olds weighing in moderate flesh **up to 1,950 lbs.** We have secured a number the get of the most noted sires in France and Great Britain. **We have a number of top show horses.** We want you to come and look them over, and you will agree that what we have said is conservatively stated, and in spite of our selections we are able to quote very moderate prices. Remember, our horses are all kept at the farms between Atlantic and Lewis, on the main line of the Rock Island, 60 miles east of Council Bluffs.

A. A. FIRKINS. J. E. PARK.

PERCHERON STALLIONS AND MAMMOTH JACKS

Our stallions are all blacks and grays; all young; sound and ready for service. Some ton three year olds, as good as grow. All registered in P. S. of A.

Our Mammoth jacks are Kentucky and Missouri bred; all blacks with light points; all two years old and over; all registered and every one has size and quality; all broke to service. We give a liberal guarantee with all stock. Come and see us or write. Barns in town; 50 miles north of Kansas City and 35 miles east of St. Joe on Rock Island and Burlington.

FIRKINS & PARK, CAMERON, MO.

SEE OUR STALLIONS

BEFORE YOU BUY.

Percheron, Belgian and German Coach.

Our last importation arrived December 28. These with the select lot on hand enable us to offer for inspection at this time a great collection of stallions of strong individuality, rare quality and standard breed types. **There are yours at bed rock prices. OUR GUARANTEE is different** to that **offered by any other firm.** It will pay you to investigate it if you contemplate the purchase of a stallion.

Mention American Breeder when you write.

PUTTING IN THE COLT CROP

Will It Be Done Carefully, to Pave the Way for Good Results, or in Haste, With Overworked and Ill Conditioned Mares?

With the beginning of the breeding eason the difference in the minds of en is noticed. Some are always in hurry. They bring their mares to ie stallion on the gallop; want them red immediately, so that they may urry away and accomplish great ings in a very short time. Mares at are brought to the stallion in is manner are not profitable, either their owners or to the owners of allions and jacks. The percentage foals is very small from such prac-ces; no matter what kind of a mare may be the percentage is usually ery light. There are some mares that ill fertilize under any and all condi-ons and produce living foals, but the verage mare requires a more quiet fe. The individual who is nervous ith his breeding stock always rush-g and whipping and jerking, had etter work geldings. Some of these en may be good feeders but they o not understand the physical abil-y of producing females. They seem be of the opinion that a mare is st the same as an engine—all that required is to put in the fuel and en the throttle.

On an adjoining farm one can find individual who owns a number of ares and all of them produce living als. On the other no colts will be und. This difference can frequently e blamed on the reckless hired hand, hose principal object is to draw his ay and make a showing in work. He erhaps does not realize that he is sing his employer more money each ear than he makes. Such hired hands re expensive at any price.

We hope there are no owners of ares who would willfully abuse them the extent that they would not ise colts. What animal is more loyal its owner, or more profitable, than good producing mare? She labors early every day in the year, to the est of her ability, and produces a lt, that at 2 or 3 years of age has much purchasing value as the dam ad. Yet there are men who will buse these mares when they are do-g the best they can.

Another important feature is that a od producing female of any kind ust receive much more nutrition an a gelding. There are usually two odies to feed and in some cases ree. A pregnant mare with a foal t her side must be in a good physi-al condition to digest enough food r the trio, besides being compelled do as much work as a gelding and o often receive the abuse of a hired and.

No man should own a mare that e does not think enough of to give fficient nutrition and reasonable are to keep in a thrifty condition. here are financial reasons for this. the first place, if a mare is not ept in good condition, she is not rofitable from any angle. Her diges-ve organs are in a bad condition, hich requires more feed and she can-ot perform her labor as well. We ave often said that a horse of any ind should have a little reserve in nergy. That is, too many men get ll the power that an animal pos-esses every day. They should be re-uperated just a little so that an ani-al might have an opportunity to gain strength. A good brood mare should have a good bread basket, a well sprung rib and be full in the flank. These hollow flank mares are not good producers, as a rule; more especially when they are required to work they are usually easily "physicked" and the digestive organs are so closely associated with the generative tract that any derangement in the way of feed is liable to cause an abortion. Highly strung mares are not usually a success when they are employed at hard labor; they do not take care of themselves and usually make their labor more difficult than mares of a quiet temperament. Mares in a run-down or overtaxed condition are more susceptible to infection of the different types. This is more especially true of influenza or a catarrhal condition which is very prevalent during the spring months.

Every breeder should have a clinical thermometer, so that he might diagnose this condition. Influenza causes the temperature of the animal to rise rapidly. There may not be much outward evidence; the animal may work and eat, yet be in a very bad physical condition. When the temperature is above 102 the mare should receive good care until this is relieved. The temperature may reach 105 or more. If an extreme temperature is reached these mares are nearly always difficult to fertilize during that season.

Most mares that are not with foal will be bred early, and much damage may be done by this early breeding. Usually among the early mares some will be diseased. A stallion owner must either refuse to breed the diseased mares with the natural service or convey this infection to other mares at a time when they are more liable to be infected. During this time of the year mares are started in their work; most of them are very soft. This will cause a great change in their system. Mares are all shedding and take cold easily. The mucous membranes are highly inflamed. There is very little opportunity, as a rule, of getting these mares in foal early. We would advise putting them off when possible until a later date, except mares with colts by their side.

About 85 per cent of the colts that die before weaning time are foaled before May 1. In this latitude June is the best month in the year to breed mares, so that the colts may come after the mares have had a little green grass, which eliminates the poison from the system and puts them in a better condition. The colts are born after the sun has destroyed much infection in the pasture so that the colts do not have navel ill so readily. A great many wish to breed their mares early so that they will have early colts. When a colt comes early if it is not properly dried at foaling time and is allowed to lie on the damp cold ground, pneumonia is quite frequently the result. The stallion owner may discourage early breeding as much as he can, yet there will be plenty of business, that he must attend to which will be sufficient to keep the sire in good working order. There are mare owners who will not listen to this advice but insist on raising early colts, believing that they will be worth more money. They do not realize that colts should never be stunted. Colts foaled in May are not as liable to be stunted as one foaled earlier, because the mare is more accustomed to her labor and her condition is usually better. The milk does not contain as much poison from her system.

Those who wish to investigate may notice the colts foaled in the month of May or early June and see if they are not just as good, and as well developed, as a rule, as their earlier neighbors. After a colt has been stunted it is more difficult to get it started again and fill out as nature intended. At no time during the growing life of young stock should their growth ever be stopped. It is not necessary that a colt be burdened with flesh, but it should never lose that natural flesh that nature intended it should have. The country is full of horses and mules that are not more than two-thirds as large as they could have been made with proper care. This tendency on the part of American horse breeders is the reason that it is necessary to continue to use the best possible sires in order to increase the size and quality of our stock.

The nine-day mares are frequently complained of and occasionally called "every other year" mares. A mare may have difficulty at foaling time and lacerate the cervix or a piece of the placenta may be retained in the uterus. Either of the conditions might be serious enough to prevent the mare from getting with foal. Frequently these mares are heavy milkers. The energy is directed from the generative organs to the milk supply to the extent that the ova may not mature. These mares may also be infected by a stallion which has recently served a diseased mare. Owing to the condition of the generative tract so soon after foaling, it may be possible that these mares are more easily infected at this time. Some breeders contend that this infection is more serious with nine-day mares. The best possible results with nine-day mares can be had by breeding them with the capsule from the seventh to the ninth day, whether they are in heat or not without even trying them. Our stallions under domestication are a little too severe for mares having colts by their side. It is only natural for a mother to protect her offspring; when a loud, rough stallion makes his appearance the mare usually resents his company, owing to fear for her progeny.

The cervix at the time of service may be closed very tight so that the semen is deposited in the vagina and may not enter the uterus at the time of service or soon afterward. Mares that are not fertilized within a reasonable time after giving birth to a foal, are more difficult, owing to the energy being diverted to the milk supply. This is more especially true of mares that are worked hard. Every effort should be made to get a mare with foal at the first heat period after parturition. A capsule containing live spermatozoa inserted into the uterus at the right temperature in a natural healthy condition, is all that any stallion can do under any condition, and much more than the average stallion does. At this particular service the stallion should be capable of discharging live spermatozoa and should not be bred to an excess before this service so as to have an opportunity to have a supply of spermatozoa.

Breeding with capsules is a great time saver for the mare owners. When a sire is advertised to make a service at a certain hour of the day, all the mares present can usually be bred,

TO THE MARE OWNERS.

The subscriptions of several thousand breeders which have been paid for a short time, by stallion or jack owners expire with this number. We hope the information thus provided will be helpful to these new readers in raising more and better colts. We earnestly request each one of these readers to see or telephone the stallion or jack owner that has paid his subscription for these few issues, and join a club of subscribers. A clubbing rate is made to all regular subscribers in clubs of four or more at 75 cents each per year. We feel sure that nearly all owners of mares will wish to study the American Breeder School of which they had the first lesson in the March 5th issue. The next lesson appears in the April 5th issue, which is also the "Barren Mare Issue."

Mares which do not produce regularly are expensive. A little information and better care should make nearly every mare of a breeding age a producer. No other factor will serve to keep boys on the farm better than the knowledge of and interest in horsemanship. The best way to hold their interest is to raise good horses and make every animal produce a profit.

We hope every one of our new readers will become affiliated with our army of educated breeders, and feel perfectly free to ask questions or make suggestions on any subject pertaining to live stock.

Every issue of the American Breeder is more than worth the subscription price to any farmer or breeder, but we guarantee two big papers a month for a whole year, with a lot of information that absolutely cannot be obtained anywhere else. We hope our introduction has been sufficient so that these new readers will remain with us permanently.

so that it is not necessary to make dates. The progressive stallion owner should have a microscope so that the semen may be tested and show his customers that his stallion is fertile, and then if the mare does not get with foal it is not the fault of the stallion. If the semen is not alive, the mare may be bred at a later date during that heat period. The microscope is an advantage to every stallion owner in this respect whether capsules are used or not.

The progressive stallion or jack owner who wishes to introduce into his community modern methods of breeding should be encouraged by the mare owners. It is their duty to help him in every way possible. One of the most disagreeable things when the operator is about to breed is to have a few men in the audience making funny remarks. These individuals perhaps do not understand what effect it has on the other members present, or especially on the operator. A little assistance from the mare owners in this respect is usually greatly appreciated. Owners of mares can be of much help in improving the horse flesh in their communities. A few individuals who are leaders can do much in this direction. When some individual has purchased an outstanding sire and has given his time and attention toward learning how to get the mares in foal so that each colt produced will actually net its owner a good profit, he should have undivided support in that direction. Very frequently a fine sire is not patronized because the mare owners have not understood the value of producing good colts. Those who have studied this problem, and realize its far-reaching effect, should not only patronize this stallion but they should lend their assistance toward getting other men to do likewise. It does not take many men who are good workers in a community to eliminate from that section all of the scrub horses. Just think what one man can do if he wants to. Talk to every farmer he meets; get them to think about it; ask them if they want to raise a lot of horses that will lose them money, even if they all live? Nearly every colt sired by a scrub horse will lose money for its owner. A good sire in a community if properly handled can breed nearly all the mares, and make it cheaper for the mare owners and net a handsome profit on each colt. And this will soon raise the standard of horses.

TOWN AND COUNTRY GETTING TOGETHER.

An incident of the new order of things which prevails in many agricultural sections of this country was the St. Patrick's Day dinner held at Sedalia, Mo., at which 700 country and town people, who had been actively co-operating in the interest of the county, were present as guests. Pettis County, of which Sedalia is the seat, is said to be the first county in America to organize a county Bureau of Agriculture and employ an agricultural expert wholly at the expense of the organization.

HORSES ON FARMS GAIN $202,500,000.

A gain for the past two and one-half years, of over $202,500,000 in the value of horses on the farms of the United States is shown by recent figures put out by the census department. Probably over half this gain comes from increased average value per head, as the increase in numbers has been light in most states, and one or two have shown a decrease. When it comes to value, however, every state has made a gain, as shown by the table presented herewith.

These figures do not include horses in cities and small towns, where, as a rules, there has been an increase in the number and value of horses used for draft purposes, and a decrease in the number of driving horses. Average prices for driving horses have not been much changed, in the cities and towns.

The figures for 1910 are from the census begun in April, and made public in November. The figures for 1913 are from census work begun early the past winter. A census taken in April would show two increases over the figures given, viz., a small one due to early colts, and a large one due to the increase in prices caused by the spring work demand.

TRIPLETS—TWO MULES, ONE HORSE.

To the American Breeder:—I did not see the colts mentioned in the clipping printed below, but saw Mr. McCarty, who owns the mare, and he says the facts are in accordance with the statement.—A. W. Fravel, Boone County, Mo.

Here is the clipping Dr. Fravel sent:

Farmers living north of town, says the Hartsburg Truth, report the following very unusual occurrence, and say they have proof of its truthfulness: A mare belonging to W. V. McCarty recently gave birth to three colts. Two of the colts were mules and the other a horse. Mr. McCarty lives near the Joe Wren school house.

Questions and Answers.

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

TWO YEAR OLD SERVICES—How many mares should a two year old Percheron colt serve this spring, not to hurt him for future use? How far apart should they be? Should he serve any in the fall season? He is a good, big, strong colt, with a strong constitution. Would you advise light work for him for his own good?—Ohio Subscriber.

REPLY—About eight or ten services should be sufficient for a two year old stallion, no two services closer than one week. A few mares might be bred late in the fall. If you are real gentle with this colt you might break him in to work; do not worry him but keep him growing nicely. When he is to be exerted much we would advise cutting his grain ration down to prevent sickness. A very good method of breaking these colts is to put a line on each side of them and drive them with lines before they are hitched to anything so that they will understand what is wanted in the way of stopping and starting. There is not much danger of an accident when handled this way. Just a little work of this kind each day will get him familiar with the bridle and teach him when to stop and to start.

TESTING THE SEMEN—Please tell me how strong a microscope is required to see the spermatozoa of a horse and where can I buy one and about what it would cost.—Illinois Subscriber.

REPLY—A microscope having a power of 100 diameters is sufficient to see the movement of the spermatozoa, but they will look very small with this magnification. Five hundred diameters is the best for testing semen. The microscope used by the Scientific Breeding School can be purchased from the Kansas City Impregnator Company for $35. This microscope is cased in a nice mahogany box and can be made strong enough to use in cover slide work by getting another lense and strong enough for any purposes. We would advise getting a good microscope as the time will come when many horse breeders will want a strong microscope. There is no better advertisement in the stallion business than a good microscope. If every breeder had a microscope so that the semen could be tested at every service there would not be so many good stallions ruined every year from excessive service.

KANSAS COLLECTION LAW—Two mares were bred to my jack last season by their owner. I learned lately that these mares were mortgaged; on account of failure of crops he failed to redeem them. The man that held the mortgage lived in another county. He came and took the mares and had them sold at sheriff's sale to a man who lives in the neighborhood. One of the mares is with foal, probably both of them. What must Ido to get my money? Who must I look to for pay? Will the mares and colts stand good? Can I collect the pay right away? Who will stand responsible for my pay, the man that owned them when they were bred or the parties that took them from the first owner? The mares are still in the county. Will the parties that took them have to pay? How must I go about collecting my fees? Explain all this and other information on the subject. Make it plain.—Kansas Subscriber.

REPLY—File your claim with the Register of Deeds, giving date of service, name of the sire and a description of the mares. Also give the amount of the claim on each colt. This must be done before the colt is born, then you will have a lien on the colt for one year from the date of foaling. If the individual who bred the mares is responsible you can bring suit against him regardless of the colts as he is the one with whom you have a contract. The law, however, gives you a lien on the colt. You must decide which course you intend to pursue as you can only collect from one of these men—the one who bred the mares or the present owners of the mares. There may be a question of the legality of your claim on the colts as they were mortgaged before you filed a lien on them; they have also been sold and there was nothing on record against these mares. An innocent purchaser might

The Draft Horse on the Medium Sized Farm

By Earl A. Trimmer, Nodaway County, Mo.

The medium sized farm is, as a rule, managed by a man of moderate means, one who must make the farm pay its way and produce a living, making profit when he can.

The modern farmer is getting right after that profit. He is broad gauged. He does not hesitate to double his investment in machinery and running stock whenever he sees an opportunity to increase his profit more, in proporton to the investment. One of the surest ways of increasing profit is to decrease expenses. One of the best ways to decrease expenses is to increase efficiency by the use of larger machinery and more horse power.

Increase your horse power with size rather than numbers. The draft horse handles the gang plow, the four-section harrow, the two-row cultivator, with so much greater ease than the lighter horse that a trial with him puts you to looking for a market for the lighter horse. And with the lighter horse, that is not strictly a high class harness or saddle horse, you generally look for a market while with the draft horse, the market hunts the horse.

There is no work on a farm too light for the draft horse where a horse is needed at all. Since we work the farm for every possible means of profit, is it not good business sense to keep, as working stock, only good draft mares that can work every day in the year except the ten days immediately following foaling? At the same time this mare will produce a colt that at weaning time is worth as much as the average price per head of all the horses in the state at the present time, and a colt which will increase steadily in value up to maturity, provided you do not knock him in the head with a stalk field the first winter.

I am informed that the horses imported into this country from France are raised by men on small farms and that the price of feed is much higher there than here. Mr. John Huston, the venerable live stock judge and early importer, told us at our former meeting that he had paid 60 cents per day for pasturing colts in France. Should we not produce horses of equal quality on our cheaper and better pastures.

Environment means much in the rearing of the draft horse. Proper environment includes feed, care and shelter. We have the feed and the shelter on Missouri farms. Add the care and increase the profit. Feed the colt liberally the first and second winters and you have added many dollars to the selling price, for it is this feed and care that makes weight. Extra weight is worth $20 to $25 per 100 pounds in the market. Begin the first winter's feed when the colt is about a month old.

If your mares are what might be termed "near draft mares," that is, heavy farm chunks, and you are breeding up to heavy draft, you will find the good care of the colt often getting him into the draft class where otherwise he would be classed as a chunk, for the tendency of heredity is always downward. Therefore, the money difference in this case is at least $40.

I have mentioned the care of the colt. The mare should also have proper feed and care during pregnancy and you will have a better colt to begin with. Do not minconstrue the meaning of proper feed and care. Do not feed the mare as if you would capture the prize at the fat stock show, and do not give her such excellent care as a tight box stall and no exercise. Work her moderately but avoid backing her or turning her short, or forcing her over slippery places, and avoid sudden changes of feed or work.

The cry throughout this entire land is draft horse. You may see it in every daily paper, every market report and in every farm journal under the heading, Horse Market: Draft horses, good to choice first; draft horses, fair to good, second—then the other classes follow. The draft horse will always hold the same place in the market. He is king.

I wish to say to the farmer who remembers so well the depression of fifteen years ago and who has worked only mongrels since, that it takes no more corn nor hogs to buy a good mare now than it did then and at present there are 50 per cent more horses in the United States than there were at that time. They have a total value five times as great, while the demand becomes greater each succeeding spring, but it is the draft horse that is most in demand.

The importers and breeders of our country are devoting their time and investing their capital toward furthering the draft horse industry. They are placing good stallions in every farming vicinity. We farmers should show our appreciation by patronizing these stallions with worthy mares.

We do not appeal to the farmer to plunge into the horse business but we do appeal to him to use only good draft mares as his working stock, raise only draft mares. Since he depends upon the world's markets as his outlet, he can only afford to produce that which the world demands.

Notice to All Advertisers and Intending Advertisers.

Occasionally we receive a letter from some one who refers to our territory as though it was confined to the Southwest. This is an entirely wrong impression. The American Breeder has a national circulation, although it is much heaviest in the corn belt states. Not only has the American Breeder got subscribers in every state in the Union, but it has them in Canada, Cuba, Mexico and in South American and European countries as well. The American Breeder is quoted editorially all over this country and in England—a prestige that adds value to its wide circulation. We often receive, within one week, reports of good results from advertisers in Ohio, North Dakota, Colorado, Illinois, Kansas and Texas. It is no new thing for our regular advertisers any more, to sell into a half dozen states through the American Breeder, and but for prohibitory freight rates they could sell into a score of states just as well. American Breeder inquiries are liable to come from any corner of the country.

There is another point we ask our patrons to keep in mind; our closing dates. By that we mean the last date on which we can take good care of an advertisement for the current issue. We have announced the 1st and 15th of each month as these dates. It is sometimes possible for us to get an advertisement in type and in the paper as late as the 3rd and 17th, but the only safe way is to have the order and copy reach us on the 1st and 15th. We want to give good advertising service to every customer, and we thank every customer for the good business we have received from him.

Last, but not least, the two April issues of the American Breeder will be among the best of the year in which to advertise. At no time is the paper more closely read, and never before has it been more interesting, and never since the first two years, have so many new subscribers been put on the list.

EXTRA UTERINE PREGNANCY.

I have been told that mares are sometimes in foal when the colt is not in the genital organs. Will you please explain this.—Subscriber.

Conception usually takes place in the uterine duct (Fallopian tubes) but it happens that some of the more vigorous spermatozoa penetrate even to the ovaries themselves and pregnate the ovum shortly after it is released from the Graafinan vesicle.

Naturally the ovum is directed by means of the fimbria (finger-like process) into the Fallopian tube where it may journey onward toward the uterus. Should the ovum fail to become directed as provided it falls into the peritoneal cavity where it may become attached to any of the organs and there undergo such development as it may from absorbing nutrition from the organ to which it is attached.

This is known as extra uterine pregnancy. The result of such conception is that the fetus rarely grows to a state of maturity, but dies from lack of nutrition due to the imperfect arrangements made by nature to foster its growth on account of being out of its natural cavity. Ordinarily it becomes mummified and the harm resulting from its presence is governed largely by its development. Mummified bodies have been found in aged breeding animals that have undoubtedly been there for years.

Should the fetus grow to a state of maturity the dam will show all the signs of approaching delivery, but such a delivery could only take place through surgical aid, which generally results fatally to the mare.

NAVEL ILL.

Last season we introduced a drying powder for the navel cord of new born animals. This prescription was not easily filled at the common drug stores, and the price was frequently too high. Another difficulty was to get these drugs properly mixed. Even when it was possible to fill this prescription and get it properly mixed, the waste was too great, as it was usually put up in a small paper package so that it could not be administered sparingly.

We therefore purchased the needed drugs in large quantities, at wholesale prices, prepared the material ready for use and had it put up in tin boxes that look like pepper boxes, so that a little of it can be dusted on the navel cord without much waste. This prescription had been used and found very successful. Those who purchased it last year are writing to know if they can get more, so we have decided to again place this drying powder on the market at about cost to us, which is 50 cents a box.

When the foal arrives the navel cord should be stripped down a little so that as much fluid as possible can be stripped out, then dust the navel cord with this drying powder two or three times a day until it is dried up. If this is properly done the colt will not die of navel ill, but it should be administered as soon after foaling as possible. After the germ enters the navel cord this treatment will not be of any value except to keep other germs from entering. The owner of every mare which is going to foal should have a can of this drying powder ready before hand, so that he can put it on the navel cord just as soon as the colt is dropped. Delay is dangerous.

The subject of navel ill will be taken up more fully in a later issue, but there will be many colts dropped in the very near future and those who wish to be perfectly safe should send and get a box of this drying powder immediately. It is the best and cheapest successful remedy on the market and very easily applied. Send to the American Breeder for this drying powder, the price of which is 50 cents per can. There is enough in one box to treat a dozen colts successfully.

NOT MUCH SYMPATHY FOR C.

To the American Breeder: In your issue of January 20, page 8, questions for subscribers to answer in regard to mare dying, after being sold, and C demanding another service free on account of colt not standing. Did C. refund any money to the party who purchased the mare from him? When C. sold the mare he had no further claim on the mare or colt in regard to service fee and it looks as though he, like many others, is trying to get something for nothing. C. understood B.'s terms when he bred the mare to B.'s horse, therefore he is not entitled to another season free, even if the mare did not prove to be in foal. When C. sold the mare in foal he, no doubt, received a greater price for her than if she was not in foal, and received the benefit of the service fee which he paid B. The sooner B. drops such customers as C. the better it will be for his business. B. should not guarantee a colt to stand and suck when his horse gets the mare in foal. The horse has done his part and the fee is due. I would like to hear through the American Breeder from other stallion owners on this question.—V. Lynees, Eddy County, N. D.

To the American Breeder: I have been keeping stallions for twenty-five years and thought I had some customers with plenty of gall and cheek, but Kansas subscriber's man beats them all. I think he has as much right to ask for free season for as many mares as he can muster up. C. B. Dannen, Marshall County, Ia., and F. W. Moeller, Calhoun County, Ia., are about right as to the stallion and mare laws. Give us some laws that are fair to all, both stallion and mare owners.—J. W. McConnell, Davis County, Ia.

To the American Breeder: Will say that I think B. is entitled to keep his fee for the season of his stallion, as he performed his part of the contract. Of course, B, is liable to lose a good customer, and perhaps some of C.'s friends would take C.'s part and would knock B.'s business. I don't think that a stallioner should be too close. He can afford to lose the season once in a while and he will be able to gain more business by refunding the season.—Frank N. Taylor, Ada County, Idaho.

To the American Breeder: Have used the capsule system three years with great success. Have some trouble educating the people to it. The first year only served such mares as wanted to try it. Second year every other day. Have settled mares that will not get in foal with natural service. I think that the day is coming when it will be the only way of breeding.—J. E. Morelock & Bros., Green Castle, Mo.

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and Modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE, Editors.

GRADE HORSES.

There seems to be a misunderstanding among horse breeders as to the term "grade." A grade is one sired by a pure bred stallion and out of a mare that is not pure, or out of a pure bred mare and sired by a grade or mongrel stallion. A considerable rivalry exists between the owners of grade stallions and the possessors of pure bred horses. A stallion registered in a recognized association is considered pure bred, that is, that his ancestors on both sides for some generations have been of a particular breed, type, conformation and peculiar characteristics of this class of animals. The more there are of registered ancestors on both sides the more sure this particular animal is to transmit the characters of his breed. If the breed in question is suitable for producing a high class market horse, a record for such a class of animals is a necessity, and should be encouraged. There is an occasional meritorious animal and otherwise pure bred in the proper sense, which through neglect has never been registered, or perhaps some of his ancestors were neglected, making it impossible to meet the requirements of its special record association. There are other good ones that may have several top crosses of a pure bred lineage, yet not eligible to registration.

In order to take a broader view of the situation as it now exists we might say that all breeders of live stock could profitably look forward a quarter of a century and make a guess at the progress which should be made in this country. During that time practically every sire should be a pure bred animal. That would give sufficient time for those now in use to have outlived their usefulness. With proper care of the pure bred females which now exist an opportunity should be afforded to produce enough good outstanding individuals so that it would not be necessary to use any except the best.

There are occasionally excellent producers that are not registered. This has been proven on many occasions by the progeny, which is the real test of a sire. There are, however, grade horses that produce a few exceptionally good ones while the majority may be inferior. The great difficulty with grade horses is that practically nothing is known of their breeding. For instance, if a stallion is one-fourth Shetland pony, one-fourth Hackney, one-fourth Shire and one-fourth pacing blood, it would only be a guess as to what his progeny would look like or be able to do. He, himself, might be an excellent individual of any one of the four types. Occasionally one sees a large draft horse which has the natural pacing gait. This, of course, is not natural to the draft horse and usually comes from a mixture of blood. Occasionally a draft horse is seen that is very light boned. Many traits not belonging with the conformation can be produced by using a stallion having these different crosses. But the greatest difficulty in using sires having mixed blood is that the colts at weaning time are very misleading. If they have had good care they may look better at that time than they will at maturity.

Among pure breeds that have been registered for several generations, and every effort has been made to use the best possible sire, an occasional individual may be produced with a very bad conformation. This may breed back for many generations. Such animals should be discarded, even though they have excellent pedigrees. Blood lines, conformation and proper development all are necessary if the best results are to be expected.

Several stallion inspection laws have provisions for stallions out of a mare registered in one record and a stallion registered in another breed association. There is very little use for such a provision. In fact, under the present standard of American appreciation no intelligent breeder would make such a cross because it would not be profitable to own a stallion of this kind to use on pure bred mares. These crossbreds are not much if any better than grades and should not be encouraged.

SHORTHORN VS. HEREFORD CATTLE.

As the preparation time arrives for another season of stock shows we are reminded of the falling off disclosed last season in some of the exhibits of Shorthorn cattle. This was apparent even to those not especially interested in the cattle division of our live stock shows, and the question was asked many times over why a breed like the Shorthorn which has occupied the leading position and been justly popular on this continent longer than any other breed, should show this indication of lack of interest at a time when all kinds of cattle were going up in value. It must be that the years of small profits, and even losses, on the part of beef cattle breeders have been more discouraging to Shorthorn cattle men than people have realized generally, for there can be no question as to the merit of the cattle themselves or the ability of the breed to make good if given intelligent care and the right opportunity.

There is one point which should be kept in mind in this connection as it will serve as a warning to breeders in the future. At a time when the demand for Hereford bulls had fallen off to an extent that forced breeders everywhere to castrate all or a considerable portion of their male calves, there was still enough demand for Shorthorn bulls to encourage the holding of many an animal that should have gone into the fattening pen. This excess of popularity has really proven a damage to the breed, for as a result of it high class pure bred Hereford steers were making new friends and laying the foundation for the prosperity which Hereford cattle men are now experiencing, just at a time that a lot of Shorthorn breeders were hanging on to the "forlorn hope" of the bull trade when they, too, could have been making friends for their breed among the buyers and handlers of beef stock, which is the court of last resort.

It looks now as though it was up to some of the younger men and the more local leaders in the Shorthorn ranks to make up for the lost opportunity and to give this grand breed a better chance to remind the world anew that it long ago honestly earned the right to be known as the "Farmer's Cow."

THE AMERICAN BREEDER SCHOOL

It is remarkable what great interest the breeders are taking in getting their customers started with this school. They seem to realize the necessity of it. We are glad to see the stallion and jack owners become more closely associated with their customers. The owner of nearly every mare that is kept for breeding purposes realizes the necessity of getting the mare with foal and taking care of her so that she will produce a good one. There are some, however, who do not understand the necessity for doing certain things in order to accomplish this. If these individuals would get better posted they could see how much they were losing by not having their mares produce regularly. When a mare loses a colt the mare owner loses several times as much as the stallion or jack owner, but if the breeders all work together for the best resuts, every one interested will make more money.

Education along these lines is the key to success. When one knows the necessity for doing certain things it is not nearly so liable to be neglected. If every stallion and jack owner will get busy and put on all the mare owners he can, it will be profitable all round. No breeder can expect to have a good breeding district without education. We are making a rate of 75 cents each in clubs of four or more, for one year's subscription.

The following is a fair sample of a great many letters we have received already on this point:

"To the American Breeder:—Will say in regard to your article entitled 'Studying Horse Breeding at Home,' that I think it would be of great help to most of us. I will pledge myself for ten subscribers for this year. Success to the American Breeder.—C. E. Hodgden, Neosho County, Kas."

OBJECTIONS TO CAPSULE BREEDING.

When capsule breeding is introduced into a community some competitors start the rumor that the colts will not be as good as those produced with the natural service. There is absolutely no difference; one is just as good as the other except that where capsules are used it is not necessary to make more than one service a day. By making only one service a day the semen is stronger and better and the colts stand up better—they have a better start in life because the stallion is not bred to excess. Another advantage is that when making only one service a day, a mature stallion should discharge live spermatoza at every service. The mares are more certain to fertilize every time because it requires living spermatozoa to get colts.

Another objection which is heard is that when the semen is taken from one mare and put in the other, the operator is liable to get the germ from one mare and use the other mare as an incubator in growing the colt. As the rumor goes, you do not know what kind of a colt you are going to get. These statements are made only by ignorant men. It is impossible to get the ova from a mare while she is in heat, as it is not liberated until the heat period has closed. Furthermore, fertilization takes place in the uterine duct (Fallopian Tube). When a statement is made that the egg is taken from a mare it is evidence that an ignorant man is talking; if he was really intelligent he would not make a statement of that kind. There is absolutely nothing to that statement. If it had been possible to get the egg from the mare, why is it that a jennet never raises a mule colt when the semen is taken from a mare after being served by a jack? There are thousands and thousands of such cases but there never has been a case on record where a jennet produced a mule from such a capsule service.

Another rumor is liable to be heard, that artificial breeding causes mares to be barren. This is also an absurd statement and made by some ignoramus for the purpose of destroying a competitor. It may be summed up this way: When a competitor starts a rumor that the capsule system is not successful, or that it has something connected with it that is of a doubtful character, he has an "ax to grind." He is afraid of it.

WORN OUT MARES.

About the first thing new beginners in the breeding business think of is to go to the large cities and get a lot of old mares that are worn out. They seem to be of the opinion that these old mares, 15 years or over, would be great prospects. Quite a few stallion and jack owners have done this; others have purchasel these mares with a view of reselling them in their home community so that more mares might be brought in, and thus have more business for their breeding stock.

With the common run of farm mares after they begin to show their age, and their teeth are impaired, the older they get the less liable they are to produce foals, as a rule. There are exceptions to this, of course. Some mares produce foals with much regularity for a great many years, but after the average farm mare has reached the age of 15 years, her producing career is pretty well spent. As a rule about one mare out of 20 will raise a living colt after she has reached the age of 20 years. The best producing ages are from seven to nine years.

The mares which have been used on the streets and have not been producing foals, offer a little different proposition. If they have gone to the city trade during prevailing good prices it would lead us to believe that they were not good producers, or the farmers would not have sold them. Mares are worth much more on the farms than geldings and geldings are more desirable in the cities than mares, so the proper place for all producing dams is on the farm. These mares which have spent many years in the cities without raising foals are usually difficult to fertilize, because the generative organs have been allowed to deteriorate through the lack of use. We would not consider old worn out mares profitable as producers, either from a purchasing standpoint or as desirable material on which to use good stallions and jacks. The per cent of foals would usually be entirely too small. If the purchaser is an expert on diagnosing breeding conditions and a good judge of age, he may find a few mares that are a little sore that can be used on the farm at a profit.

BUYERS SEEKING THIS KIND.

Every few days an inquiry comes to this office from someone who wants to buy good heavy work horses or mules. One of the latest is a letter just received from a big lumber company in Michigan, which gets the American Breeder. This firm wants to buy a carload or two from first hands, and writes that it does not find the kind of stock it wants advertised in our columns. It is true that while the American Breeder carries more advertisements of horse and jack breeding stock than any other paper in the world only a compara-

tively few advertisers offer work stock. The demand for work stock, especially at this time of year and a little later, is almost as widespread and urgent as the demand for breeding stock and those who have anything to sell in this line can undoubtedly secure good results.

SUBSCRIBERS' OPINIONS WANTED

A Minnesota subscriber made us the inquiry printed below. As it raises questions upon which it is desirable to have information from various points of view, we put them all up to our readers and ask for a conservative expression of opinion on each question separately:

"To the American Breeder: Would you kindly tell me which state has the best stallion examination board? Will you please state your opinion as to what constitutes a sound stallion for services? Would you consider a stallion with a spavin or a side bone unfit for service? What would be your idea in appointing a board of examiners to pass on stallions for service? I would like very much to hear from the breeders through your valuable paper.—R. La Pointe, V. S., Nicollet County, Minn."

EXAGGERATION IN LAND ADVERTISING.

Any railroad or real estate firm that misrepresents the opportunities in a new country, with the result that disappointment and even distress is likely some day to become the lot of those who have faith in such representations, should be held responsible for all the ills that follow the "boom" which their methods develop. Undoubtedly the colonization departments of many railways have a legitimate field in which to work and can honestly render their companies a great service by encouraging the settlement of the land along their lines. Some of the best conceived and most effective advertising now appearing in the agricultural papers has been put out with this purpose in view. All such advertisers, however, who wish to stay within the bounds of common honesty, refrain from making such claims as the following, taken from the advertisement of a "Land Improvement Company" which might appear to be connected with a railroad company, although we do not think the railway management assumes any responsibility in this case:

"If you had taken a farm ten years ago and developed it with intelligence and vigor, you, too, would now be lending money to Wall Street, as other farmers are doing. You, too, would have a piano in your parlor and an automobile in your barn."

VALUE OF STOCK FOODS.

For several weeks the sales agent for unclaimed freight on one Missouri railroad advertised for sale stock foods of several different well known brands. Apparently he has these stock foods for sale in considerable quantities. The prices he asks in most cases are from one-third to two-fifths of the published prices for these stock foods. Undoubtedly the manufacturers of these goods could have these shipments returned to them on payment of the freight. That they do not choose to do so is indicated by the advertising of this sales agent. Can it be possible that in spite of all the glowing claims to the contrary which the manufacturers make, these stock foods are not really worth what it costs to ship them about the country?

SPONGES FOR BREEDING PURPOSES.

Some breeders use sponges for cleaning the generative organs, and other purposes. We would advise burning all sponges, as they are very difficult to clean. It is almost impossible to destroy the infection in a sponge, even by boiling, and it will not stand boiling very long. If anything is used for this purpose a clean white cloth should be used so that it can be boiled each time before using. They will last a long time and are much cheaper, better and more satisfactory.

REQUESTS FOR A COVER CUT.

Several inquiries have been received for the cut used on our front cover of March 5. This cut was made from a photograph furnished us by H. G. Bronlawe, one of our good Kansas subscribers. We can make new cuts the same size, from this photograph, at a cost of $3.80 each, and will send them out by express (charges collect) to any address, at this price. For $4 each we will send the cuts by parcels post, charges prepaid.

NOT WILLING TO SHOULDER ALL BLAME.

To the American Breeder:—In the February 20 issue, was reading a South Dakota mare owner's views of breeding. We will admit that half of the stallioners don't know when a mare is fit to breed. But it is not entirely his fault. When a man is told in plain language his mare is not fit to breed and it is explained to him, then he will hunt up every horse to be found until he finds one of those ignorant fellows, and he breeds her. I've seen this done: it is not the stallioner that needs a guardian. I don't care how well qualified a stallioner is in examining mares, if he rejects one the next man will breed her. And as to the stand and suck plan, it is a mighty poor one. I've bred both ways and will say I lost ten dollars to one, for two-thirds are never ready to pay up. If you don't get busy in the six months and get your judgment, you are out. When a man has a horse nine years old and the service fee not paid, and lives in four miles of the stallioner, don't see how that man can look that stallioner in the face. As to the half cash down, the mare owners would be more prompt in retrying, as they are so forgetful. Many a one will say, "Well, if it don't stand and suck, I won't have to pay," and the mare looks after herself.

And speaking of capsule breeding, it is a grand thing, if you could get life enough in the farmers to bunch their mares—no you must call on each one and peddle. Am I not right? This is my view.—Scott Huntosh, Todd County, Minn.

A GOOD BELGIAN COLT.

To the American Breeder:—I have read of some big jacks for their age, and it seems that they were extra good. It looks as if "old Missouri" holds its own, but I have not read anything about our draft colts. I have a pure bred Belgian that is seven months and ten days old, that is 15 hands high; 10¾ inches below knee; 11½ below hock; 76 inches around girth; 77 inches around flank, and weighs 1,100 pounds. This colt was sired by a 2200-pound horse; his dam weighs 1,050 pounds. This is a well proportioned colt. I feed about one-third corn, one-half oats, one-sixth bran and clover and at night he runs in stalk field, meadow and straw stack and hay in day time.—Wm. Hartman, Knox County, Mo.

THERE ARE NO "HAS BEENS" ON OUR LIST.

To the American Breeder: Enclosed please find my check for $1.00 and renew my subscription to the American Breeder for another year. It is a dandy and I do not see how any breeder can get along without it, unless he is content to be somewhat of a "has been" in the breeding world.—Clint L. Luce, Freeborn County, Minn.

Producing High-Class Beeves

Cautions Observed and Methods Followed at Institution That Has Won Over Half the "International" Steer Carcass Money the Past Five Years.

Written for the American Breeder by Prof. Ellis Rail, Department of Animal Husbandry, University of Nebraska.

Since the quality of carcass which a steer will dress and hang on the hooks determines almost as much of the price as it does its fatness and other desirable characters, it certainly is important to do what we can in an economical way toward producing not only cheap beef, but good quality beef. What I shall have to say about the feeding and management of cattle so as to produce the best possible carcasses will be based practically altogether on the methods used by the Animal Husbandry Department of the University of Nebraska. We believe our methods are good, because of the records which our carcasses have made. It may not be amiss to refer to some of these records at this time.

The only exhibit of fat cattle which the University makes is at the International. For the last five or six years steers have been entered in the carcass classes as well as in the foot shows. Out of the last half dozen shows, the Nebraska entries have twice won carcass championships, and each year that the championship was won we had first in both the yearling and two-year-old classes. In the other years the Nebraska carcasses have figured prominently in the winnings, and for the last five years more than half the money offered for dressed carcasses has been awarded Nebraska University entries.

As to essentials in producing first class carcasses: The first essential is an animal of the right type and quality. As the good book says, you can't pluck roses from thorns or figs from thistles. And you can't get a prime carcass on a low grade brute to start with. I think the thing most to be demanded in the animal to start with is smoothness and evenness of natural fleshing. One of the things that always appeals to one in looking at a dressed carcass is an even covering of thick flesh. Unless you have this evenness to start with it can't be fed on, and moreover, animals that are uneven to begin with not only do not improve any, but they grow worse through the fat covering being put on unevenly. Rough, course shoulders of course preclude the possibility of a light, smooth forequarter in the dressed animal, while rough, heavy hocks and high, coarse tail heads also are quite objectionable. In short, a smooth, fairly blocky, thick, but smooth, even fleshed steer with straight lines is the right prospect for a prime carcass when finished.

The second essential is proper feeding, that is the use of feeds that will produce a firm, even condition in the ripened animal. We might here suggest the general method of feeding which is followed in caring for the steers which the University of Nebraska uses for class work in teaching fat stock judging, and which are the steers that we exhibit. Most of our steers are either raised on the farm or secured as calves at a few months old. So they are practically developed under our own method of handling. The steer whose carcass won the champion honors at the last International was purchased when only a few months old.

In growing these steers the point aimed at is continuous development without check at any time. So we feed the youngster liberally right from the start. The time when we want our steers for use is during October, November and December, so we feed with the aim of having them in first class market shape by December 1st. During the winter they are carried on a grain ration about half to two-thirds as heavy as they would consume if fed to the limit. They are given as much roughage as they will eat, this being alfalfa hay principally, and from twelve to twenty pounds of silage, according to the size of the steer. A pound and a half of silage per hundredweight of steer is a fair basis of calculation as to the amount desirable to feed. The grain fed is practically the same for calves as for yearlings, though each steer is fed his grain separately and if necessary the feed varied a bit according to how any particular animal is doing. The standard grain ration is oats 50, corn 50, bran 20 and oil-meal 10, or oil-meal 5 and cottonseed meal 5. This is fed as was said, to steers of all ages; the condition of the animals is controlled by the amount of corn in the grain mixture. If there is too much tendency to fatten rather than grow, less corn is used. By regulating the amount of corn the herdsman can pretty well control his animals.

Now the third thing (and this is important) is the general scheme of management. While we aim to keep our steers growing pretty rapidly through winter and spring, yet we do it with a limited amount of grain, and a large amount of roughness. The same principle of management is continued through the warmer summer months, except that the younger steers are fed more heavily than the older ones. The aim is to have the cattle in good condition for heavy feeding the last ninety days. We want as little fat on them previous to this as is possible, and yet in condition enough to be well finished at the end of ninety days. Their fat and finish are thus in the freshness of "first bloom." Ripe but not a day over-done is our aim. We believe that this point has had considerable to do with the quality of the carcasses we have shown. Heavy feeding for a long period not only is apt to produce rolls and unevenness, but the fat gets somewhat stale and has not the freshness and firmness of appearance it should. Neither will the color of a long fed carcass show up with as much attractiveness.

Besides the considerations above referred to, I wish to call attention to the necessity of some exercise in order to keep the condition firm and smooth. Steers fed in the lot or on pasture get enough exercise. But stall fed animals must have regular daily exercise of some sort if they are to be kept smooth and firm, yet evenly conditioned.

From a careful review of the methods described above, and which have proven very satisfactory in producing first-class carcasses for us, some general suggestions may be drawn. The securing of a carcass that is well developed in the per cent of lean meat without an over amount of external fat is brought about by developing the animal rapidly and continuously from birth. But in obtaining this growth, care is used not to get the young things fat. So rations quite nitrogenous in character are used, and corn is not too large a part of the ration. Oats, bran, oil meal and the alfalfa hay help to develop muscle growth and keep the animals from becoming buttery or patchy, with hard rolls of fat which latter are easily formed by too much corn for a too long period. Finally the period of heavy feeding preceding finishing must not be too long in duration, so that the carcass comes from the block onto the hooks in a fresh, well colored and most attractive condition. The use of some succulent material to a considerable extent, also is beneficial in keeping the animal in a sappy, healthy condition. We neglected to state above that we use the silage up until the grass is good, after which the steers run in the pasture half the time. They are out daytime until flies come, when they are turned on the grass at night, and housed during the day. Looseness of the bowels, if too pronounced in the winter from alfalfa and silage, can usually be checked by feeding a little prairie hay. On grass the same trouble is kept in check by allowing less grass, and a bit of cured hay.

We want to append a word of explanation. It may seem from the above description of our methods that we use too much bran and oats in our ration to make it economical. Our reason is this: Practically all our steers are ripened up at least twice. We have them first and primarily for class room use in instruction work. We secure the best specimens obtainable, and because of the trouble and expense of securing animals of the best type, we keep our steers as long as we can. This means that if we fit them up in first class condition at 12 to 15 months of age, they must be let down and carried 8 to 9 months, then fitted again at 22 to 27 months of age. In order to do so, and yet keep them firm, even and fresh the second time, it is necessary to keep away from too much corn. Doubtless we could use more corn if it was only a matter of growing the young things up, and disposing of them the first time they were put in tip top condition. The production of prime carcasses, though, demands fairly well matured animals, and the records of the Chicago Carcass Contests will clearly show that the two-year-old carcasses win a great many more championships than do the first prize yearling ones.—Ellis Rail, Assistant Professor of Animal Husbandry, University of Nebraska.

PIGS AND PIG PASTURE.

Pigs, corn and clover make a most excellent combination. Perhaps the pigs and corn are being arranged for but how about the clover. If it is to be red clover then to secure the best pasturage sow a variety of grasses. Let the mixture be a combination of such grasses as thrive best in one's locality. In some sections it is well to let clover spell alfalfa.

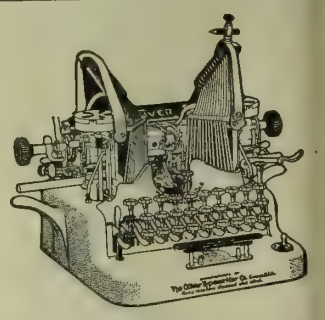
This latter plant is gaining great favor with the pig and is not only relished by him during the growing season but is eaten greedily during the winter months when nicely cured. Soaked corn with a run on a convenient field of alfalfa makes pork production easy and remunerative.

GETTING BUSINESS IN FOREIGN LANDS.

To the American Breeder:—On January 2 we wrote you advising that from the advertising copy we were running in the American Breeder we were securing excellent results, and that the American Breeder was second on the list—since that time the American Breeder has gone up a "notch." During the month of January and so far in February the American Breeder is first on the list. It may also be gratifying to you to know that our first inquiry from Europe was the result of our advertisement in the American Breeder issue of December 5. We received an inquiry from Mr. Geo. Eyre, Jr., of Warrens, Bramshaw, Nr. Lyndhurst, Totten Station, Hampshire, England, for American Self-lifting Galvanized Steel Gates.

Regarding the inquiries from for-

KEROSENE, GASOLINE AND OIL
To Consumers at Wholesale Prices



NO WATER IN MY KEROSENE OR GASOLINE.

XXX 46 gravity water white kerosene.....$6.00 for 52 gal. bbl.
XX 42 gravity kerosene (the kind usually sold).....$5.25 for 52 gal. bbl.
XXX 64 gravity gasoline. .....$10.00 for 52 gal. bbl.
1 case graphite axle grease (2 doz. 3 pound pails).....$3.50
40 gravity prime white stove distillate .....$4.50 for 52 gal. bbl.
83 gravity stove distillate .....$4.25 for 52 gal. bbl.
60 gallon (26 gauge) galvanized steel tank with pump and hood cover complete—a great convenience in every home.$3.60
Extra heavy pure crude oil, steamed and settled (black oil) good lubricant, just the thing for greasing tools.....$4.00 for 52 gal. bbl.

I will pay $1.25 each for my crude oil barrels, and $1.50 each for refined oil barrels, returned to me at Coffeyville, Kas., in good order, less freight charges on same.

AGENTS—$173 IN TWO WEEKS MADE By Mr. Williams, Illinois, selling the Automatic Jack Combination 12 tools in one. Used by auto owners, teamsters, liveries, factories, mills, miners, farmers, etc. Easy sales, big profits. Exclusive county rights if you write QUICK. **Automatic Jack Company, Box O, Bloomfield, Ind.**

eign countries wish to advise that a year ago we received an order for our Self-lifting Gates for shipment to the Negorianrion Agroicla Y Gandera de San Eurique S. A., Mexico. This is the ranch owned by the Madero family of Mexico and the late Francisco Madero, former president of Mexico, was the chief owner. On February 3, this year, we received a repeat order for shipment of our Self-lifting Gates to the same ranch and with a request that we put steel signs on the gates reading as follows: "Favor de Cerrar la Puerta,' which, for your information, means, "Please close the door." These signs to be used instead of our regular "Keep Closed" signs which we furnish to the American farmers and breeders. Owing to the execution of President Madero we have not shipped the repeat order and do not know what the final outcome will be. "War is Hell." The Mexican revolution even effects some of the manufacturers in Kansas City.—H. L. Goodwin, American Farm Gate Company.

THE BEST FEED INSURANCE.

To The American Breeder:—The best feed insurance is to plant, for grain and forage, the desirable crops most certain to succeed in the given locality. Kaffir corn is the feed grain to raise in the Oklahoma, Kansas and Nebraska districts, where the annual rainfall is from 24 to 30 inches. Its cousin, milo, is the feed grain to raise in sections of Oklahoma, Kansas, Texas, Eastern Colorado and Eastern New Mexico, where the annual rainfall is below 24 inches and not less than 12 inches.

Kaffir corn will wait for weeks for rain. The hot winds and the lack of moisture may make it wither and curl somewhat during the day, but it will freshen every night. It may be forced to stand still, and not grow for days or for weeks, but it will live and keep green. When the deferred rains do come, it shoots out heads quickly, they fill with grain and a good yield follows.

Ten bushels of Kaffir corn have the same value as nine bushels of corn for feeding work horses, beef and dairy cattle, hogs and sheep. A bushel of kaffir corn is worth more than a bushel of corn for feeding poultry.

A bushel of corn has a greater feed value than a bushel of kaffir corn, but an acre of kaffir corn has a much greater feed value than an acre of corn. In Eastern Kansas and Eastern Oklahoma an acre of kaffir corn will average a yield of grain sufficient to produce 40 pounds more meat than an acre of corn. In the central part of these states the difference in favor of kaffir corn is greater, and still further west kaffir corn will often yield 25 bushels an acre in years in which corn is a total failure.

Every farm in Eastern Kansas and Eastern Oklahoma should grow some kaffir corn. On the river bottoms at least one-fourth of the acreage on each farm that is usually planted to corn should be planted to kaffir corn. On the uplands kaffir corn will outyield corn every year, in both bushels and feed value.

In Central Kansas and Central Oklahoma, all upland usually planted to corn should be planted to kaffir corn. It will produce a good yield of grain every year and in average years a large yield. On the uplands kaffir corn will produce from 50 to 100 per cent more feed value than corn. A small acreage on every bottom farm should be planted each year, to guarantee feed for the teams and other live stock in dry years.

In Western Kansas, Western Oklahoma and the Panhandle all land used for producing grain feed should be planted either to kaffir or milo, depending on the spring moisture, conditions and average rainfall.

Farmers in Central Oklahoma began shipping in corn in July, 1911, to feed their teams, and most of them were forced to sell their hogs because they had no corn. If the fields planted to corn in 1910 had been planted instead to kaffir corn, there would have been ample grain for teams and for fattening tens of thousands of hogs and cattle. Kaffir corn would have given the Oklahoma farmers an enormous cash income, while because they insisted on raising corn, they piled up debts.

Along the Rock Island lines, between St. Louis and Kansas City, most of the farmers each plant from one-half to five acres of kaffir corn for their poultry. They have found that it gives larger returns from poultry than corn. A few acres of kaffir corn are reported in Iowa with an average yield of 46 bushels an acre, the equivalent in feeding value of 41.4 bushels of corn. It is probable that most of the corn growers in Iowa, Illinois and Indiana will find it profitable to grow a few acres of kaffir corn, the same as those in Central Missouri.—H. M. Cottrell, Agricultural Commissioner, Rock Island Lines.

LOSSES IN BARNYARD MANURE.

To the American Breeder:—In handling the barnyard manure, the farmer can save or lose hundreds of dollars annually. A manure heap is a hot bed of bacterial activities. Some of the nitrogen is formed into ammonia and passes into the air; this is a clear loss. Some is transformed into nitrates, which are soluble, washing out by rains and sink into the soil or run off into the ditch; this also is a direct loss. Some of it is formed by bacteria into nitrates and these nitrates attacked by another species of bacteria which change into nitrogen gas, which passes into the air and is lost.

Nitrogen is worth at least eight cents per pound and a horse will produce fifteen tons of manure and litter a year, containing in round numbers one hundred thirty pounds of nitrogen. At eight cents per pound the value of that manure is $10.40. It pays to save it. Experiments have taught us that liquid and solid manures when kept together deteriorate much more rapidly. Also that the more compact the manure is stored away from the weather, the least loss will result. Here is a hint for the progressive farmer. Our farmers need this nitrogen and when it rep-

What We Pay for You

By R. E. Olds, Designer

Note what we do to save cost of upkeep with users of Reo the Fifth. To save repairs and troubles. To insure you an honest car.

Cost Us $200

These extra precautions, which some call extremes, cost us about $200 per car. I employ them because, in years to come, they save $500 per car.

I have proved this fact a myriad times in my 26 years of car building.

To merely sell cars, these things are unnecessary. But to hold users' good will—hold it year after year—these things must be done.

Our Extremes

Our steel is all made to formula. It is analyzed twice before using. That saves us countless mistakes.

Our gears are tested in a crushing machine to stand 75,000 pounds per tooth. Our springs are tested for 100,000 vibrations.

Each engine is tested for 48 hours. There are five long-continued tests.

There are fully one thousand tests and inspections applied to every car.

Overcapacity

I require in each driving part an overcapacity of not less than 50 per cent.

I use oversize tires—34x4—to cut your tire upkeep in two.

I use 15 roller bearings, which cost five times what the usual ball bearings cost. And, to avoid all flaws, we use 190 drop forgings, at twice the cost of steel castings.

I use a $75 magneto—

A doubly heated carburetor—

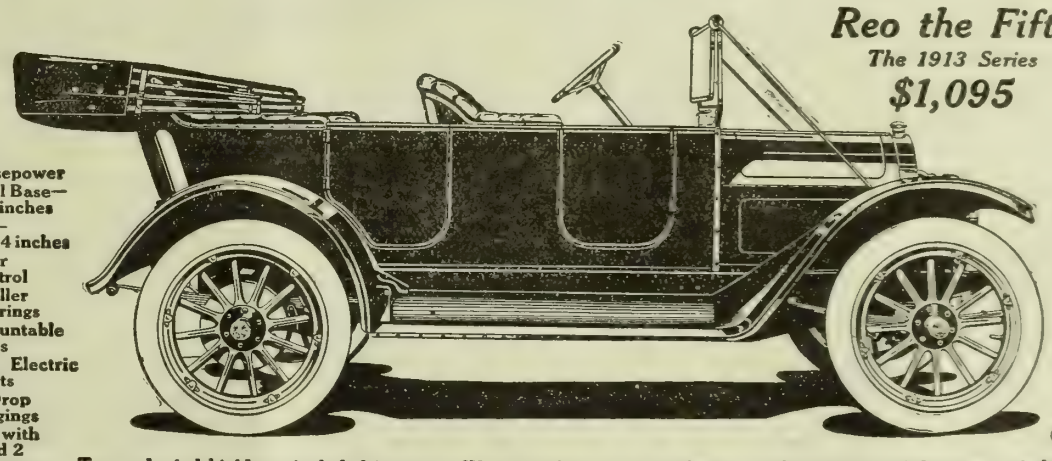
An expensive centrifugal pump—

14-inch brake drums—2-inch, seven-leaf springs—a 17-coated body.

And we limit our output to 50 cars daily, to insure accurate fitting, abundant tests. To make sure that each car is right.

Does It Pay?

You know that it pays to get a car built like this if you've owned a car that wasn't. All the difference won't show at the start, of course, but in after years you'll see it.



Every dollar I spend in these extremes saves users from two to four dollars. That's why Reo the Fifth stands at the top of its class, after 60,000 of my cars have been used.

See in this car our new center control. Note the absence of levers. Both front doors are clear. Note that it has the left side drive, like the leading cars today.

Note the flush electric dash lights. Note the splendid finish. Let our dealer point out to you the countless small perfections. This is the climax of a lifetime of effort. See what it means to you.

Write for our catalog and we will direct you to the nearest Reo showroom. They are everywhere.

R. M. Owen & Co., General Sales Agents for Reo Motor Car Co., Lansing, Mich.
Canadian Factory, St. Catharines, Ont.

Reo the Fifth
The 1913 Series
$1,095

30-35 Horsepower
Wheel Base—112 inches
Tires—34 x 4 inches
Center Control
15 Roller Bearings
Demountable Rims
Three Electric Lights
190 Drop Forgings
Made with 5 and 2 Passenger Bodies

(155)

Top and windshield not included in price. We equip this car with mohair top, side curtains and slip cover, windshield, gas tank for headlights, speedometer, self-starter, extra rim and brackets—all for $100 extra (list price $170).
(Gray & Davis Electric Lighting and Starting System at an extra price, if wanted.)

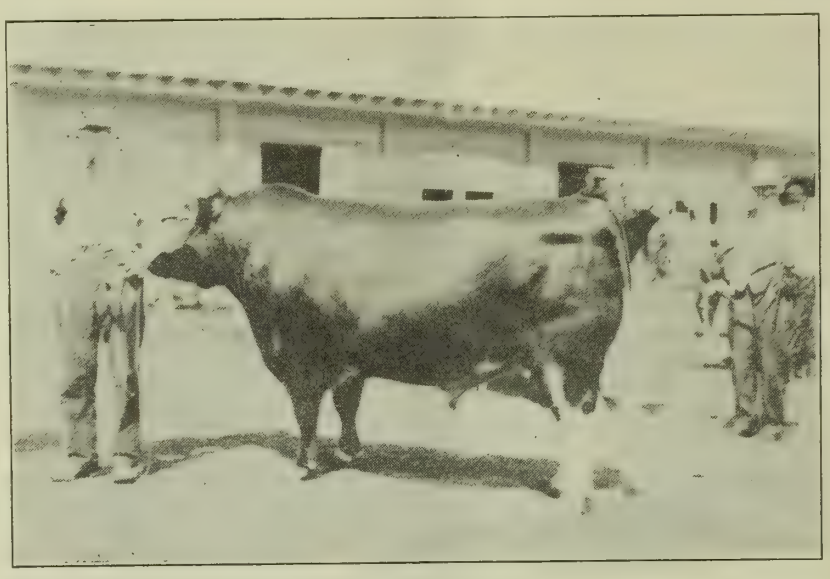
resents at least $10 per horse, one can afford to take a little better care of the manure produced by our stock. J. F. Nicholson, Bacteriologist, Idaho Experiment Station.

OX AND GASOLINE POWER IN ONE FIELD.

In an interesting article, written from Germany for the Agricultural Student, Prof. H. C. Price tells of seeing a motor plow test in a field where ox teams were also regularly at work. The farm was that of Rabbthge and Giesecke at Klein Wanzleleben, Germany, which has an international reputation for the production of sugar beet seed. "It is situated in North Central Germany, a short distance from Madgeburg, says Prof. Price, in his story, which we quote, "and consists of 12,000 acres, and is in the heart of the sugar beet district of Germany. Here has the breeding of sugar beets been carried on to an extent not equaled any place else in the country. The Klein Wanzlelebener beet (the leading variety of sugar beets) was originated and has been developed on this farm. The estate has its own sugar factory, chemical laboratories and immense warehouses for cleaning and storing sugar beet seed. Another important feature of the buildings is the barracks for housing the Polish women. They are brought in every spring and sent back every fall and do the principal part of the work of cultivating and harvesting the beet crop. The farm, with its own railroad and the buildings clustered together, give the impression of a large public institution.

"But I did not start out to describe the farm, but rather a motor plow demonstration that was held at the farm. It was a bright, crisp October morning, and a special train took the visitors out from Madgeburg. At the station we were met by the farm teams, fine Belgian draft horses, hitched to the beet wagons, and taken to the field where the demonstration was held. German agriculture is one of extremes; in one field you will see farm work being done by the most primitive methods, in the adjoining fields, perhaps, by the most modern labor-saving machinery. So in this plowing demonstration. On one side of the field 18 yoke of oxen were plowing, two yoke hitched to each plow, and pulling by bands across their foreheads. On the other side of the field were three forms of the most recent development in motor plows. (1) The steam plow, which is a fine gang plow that is pulled back and forth across the field by a cable attached to traction engines at opposite ends of the field. (2) The Koszeg implement, which is a combination plow and pulverizer, drawn by a gasoline motor, and leaves the ground ready for seeding. (3) The Stock motor plow, which is a fine gang plow drawn by a forty horse-power gasoline motor, with high wheels, and having blades on the wheels to keep them from slipping.

"About two hundred men were there to see the plows work and they represented the aristocracy of the sugar beet growers of Germany. Men of title, men of rank, men of property, they came in automobiles, in carriages and by train. Many of them control farms almost as large as the one on which the demonstration was held. Interest centered chiefly in the Stock plow, which the Germans seem to think is the coming motor plow. However, the price at which the motor plows sell here ($5,000 to $6,000), makes their use prohibitive except on the large estates.



"After spending a couple of hours in the field watching the plows work, the party was taken back to inspect the buildings and laboratories of the farm, and then all gathered in one of the buildings and representatives of the different plows were given an opportunity to tell the merits of their respective plows. Although my inability to understand the language perfectly prevented my grasping all of their arguments, it was evident from the length and intensity of their speeches that arguments were not wanting.

"At 2 o'clock the whole party, as guests of the farm, was taken to the club house, which the farm maintains, and served to an elaborate dinner. This was a typical German "spread" and "Hochs" to the hosts were frequent and loud. It was 4 o'clock when the dinner was ended, and with good cheer and good fellowship we all departed, having spent a profitable and pleasant day on one of the finest farms in Germany.

A MISSION FOR SHORTHORNS.

To the American Breeder: Less than a generation ago it was the prevalent opinion among farmers that they were not in need of and could not be helped by scientific agriculturists. Among many, "book farming," as they termed it, was held in contempt. It is true that agricultural education at that time was in its infancy and was very incomplete, but it held the principles on which a broad and helpful system of scientific agricultural education was afterward developed. The sons and grandsons of men who had no patience with "book farming" have gone to agricultural schools and obtained the knowledge necessary to enable them to intelligently undertake the various problems of farm life—the restoration of soil fertility, the introduction of better varieties of grain and the improvement of live stock. Tedious and costly experiments, conducted at state and national expense, have introduced varieties of wheat that are hardier and more resistent to frost and that add materially to the annual productive value of the land. Other experimenters have introduced new varieties of cotton with longer fiber or better quality, while still others are exeprimenting to increase the disease resisting powers of both plants and animals. All these efforts are worth while, and many have already increased the knowledge and wealth of the agricultural class. Very few farmers have the time or convenience to conduct such experiments as these, but all farmers should have the ambition to improve methods, grain and live stock. The farmer who increases the productive value of his land, either by restoring soil fertility or by raising better grain gains a personal success and to a limited extent becomes a public benefactor. If this be true of the grain farmer what can be said of the progressive stock grower? There never was a time when there was as great need of growing two pounds of beef where only one grew before. Such a marked increase may be possible only in some instances, but very great improvement is needed in the cattle of the majority of farms. The scarcity of beef cattle and their resultant high value will surely stimulate their production on farms from which cattle were eliminated by the low prices of 15 years ago. In restoring cattle to the farm, it will be an improvident and unwise man who will be content with cattle of indifferent quality. Feed has been high and will not likely be low again for some years, hence only well bred cattle that give good returns for feed consumed and that contribute to the wants of the farmer will be profitable. Not every farmer can breed pure bred cattle, but none can afford to raise scrubs.

Under present prospective conditions raising beef cattle on the farms will give a handsome profit. As a foundation for this industry Shorthorns are well adapted to every purpose. A searching test of more than 100 years in this country has fully demonstrated their worth. They are docile in disposition, they mature early, fatten easily, and when matured have greater weight. For the production of beef and milk they are the farmers' cattle.—B. O. Cowan, Los Angeles County, Cal.

MILKING SHORTHORNS IN MINNESOTA.

The United States Department of Agriculture has been demonstrating something of the possibilities of Shorthorn cattle as a milking breed. The co-operative project which has been conducted by the University of Minnesota and the United States Department of Agriculture in breeding milking Shorthorn cattle has progressed along similar lines to those of previous years. On June 30, 1912, there were four herds in the experiment. There was an increase of almost 1,000 pounds of milk per cow during the last two years. The highest yield was 8,956 pounds of milk and 402 pounds of butter fat in 365 days. A number of other cows exceeded 7,000 pounds of milk and 250 pounds of butter fat. About 60 cows were under inspection during the year. The average of these will be close to 6,000 pounds of milk and 230 pounds of butter fat, a substantial increase over the preceding year. It would seem that herd averages of 7,000 pounds of milk and 300 pounds of butter fat are possible. A few cows have done especially well, one cow giving 10,291 pounds of milk and 470 pounds of butter fat in 12 months. A cow with her second calf has a record of 8,223 pounds of milk and 286 pounds of butter fat. Other cows have increased their yields over previous years in spite of the fact that no clover hay has been fed.

In the last season for which we have a complete record, 45 cows and heifers, in a period of 328 days, averaged 5,312 pounds of milk and 202 pounds of butter fat per animal. The heifers of this lot averaged 33 months old at the time of calving.

The co-operation of the department in this experiment was withdrawn June 30, 1912.

ANTICIPATING A CERTAIN DEMAND.

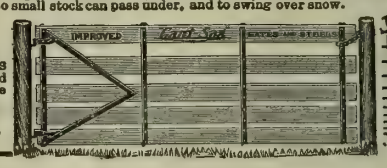
"Can't-Sag" Gates Save You BIG MONEY (6)

Cost only one-third as much as ordinary iron, wire or gas pipe gates, but last twice as long. Neat in appearance—best and strongest gate made—light, easy to handle, opens both ways. Boards are double *bolted* between eight angle steel uprights and double truss braces. *guaranteed never to sag.*

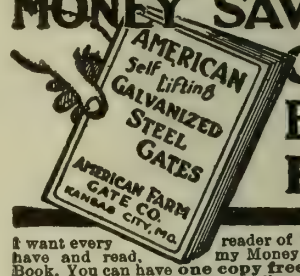
Cost Less Than All Wood Gates—Last 5 Times as Long



Can't Sag Gates are furnished complete, ready to hang, or just the Gate Steels which include everything except the boards. Patent self-locking hinge feature---reinforced two piece malleable hinges. Six Triangular Truss Braces make gates extra strong.

Improved Elevating Attachment permits the gate to be raised full length from 5 to 30 inches, so small stock can pass under, and to swing over snow.

30 Days Free Trial and 5 Year Guarantee



Catalog shows both complete Gates and just the Steels, at prices you can't afford to miss. Send for my new catalog with free 30 days' trial and *freight prepaid offer.*

horns in England. At last accounts they had made a start at Lord Lonsdale's Tring Park herd and considerable interest and curiosity are indulged as to the exact significance of their visit. The senior Mr. Cooper bred dairy Shorthorns years ago and has expressed the opinion that there is a great future for that sort in the United States.

CAKED UDDER IN COWS.

To the American Breeder: Caked udder in cows is also commonly called garget, of which there are two kinds: one, noncontagious, the other infectious.

It is a frequent trouble, especially in cold weather, often due to "catching cold" in the udder. The symptoms usually appear soon after calving, and many complications often ensue, sometimes leaving the cow with a damaged quarter.

Since cows are so high priced, it is certainly poor economy to attempt home treatment in severe cases. If your veterinarian treats the case he can give you the benefit of a personal examination. If a veterinarian is not available, the general treatment is to give a purgative of Epsom salts, bathe the udder with warm water, to which has been added several tablespoonfuls of sodium hyposulphate. Dry completely, and rub in carbolated lard or vaseline. Milk frequently.—E. T. Baker, Veterinarian, Idaho Experiment Station.

AUTOMOBILE INFLUENCE ON FARMING.

There must be some good reason for the wide use which the thrifty and practical farmers are making of automobiles throughout the country, and more especially, of the high-quality, low-priced makes. The motor car evidently must pay the farmer good dividends on his investment, for he is not given to spending his money foolishly. He must get a goodly measure of results by way of saving time, labor and money with his motor car. He and his family must be getting much pleasure, comfort and satisfaction with the automobile so long as the use of power vehicles continues to increase so remarkably everywhere among farmers.

One of our farmer patrons recently wrote us how his automobile furnished the power for blowing hay over 100 feet up into a hay mow whereby one man now easily did more than what three men and two horses formerly did. This he does by jacking up the rear axle and harnessing the motor to an old blower. Another farmer says that he markets all of his wheat and corn with his car by the aid of a trailer. Besides, he now is able to get to the city much oftener and sell his product direct without the aid of the middleman—an important factor in reducing the cost of living to the consumer. What is even of greater importance, he has happily solved the problem of how to keep his boys and girls contented on the farm. Under such conditions they would never swap the farm for the shop while their city cousins trudged back and forth from their work, either afoot or as a straphanger, while working for a scant living salary.

It is very gratifying to me that hundreds of the cars which I built in 1905, and prior thereto, are still doing yeoman service today. That is due to two things, namely: Good construction and good care on the part of the owner and driver.

As the secret of long life in man lies in good food and proper care, so with a high-quality, reliable car. Give it the best of gasoline, oil and grease combined with careful driving and reasonable protection against the elements and against the extremes of heat and cold. Barring tires, a car of known honesty and reliability of construction should last a farmer from six to ten years.

The farmer's life is, at the best, frequently full of drudgery and monotony; even those who count their acres by the hundreds, if they are making a success in their line, cannot get rid of a certain amount of monotony, and it is this monotonous, day in and day out grind, more than anything else, that causes the farmer to break down in middle life. His wife at forty often looks as old as her city sister of fifty-five, while his children drift cityward where they frequently live up more than they can earn.

To the modern farmer these days are passing. He realizes that he must not put all his dividends back into working capital, such as land, stock, etc., and leave a great fortune for his city children to law over. But, if he takes more than a narrow interest in his family he finds that he must make the farm home as near ideal as possible, and he puts his money into modern living just as his city brother is doing and with his modern home equipment, there must follow the motor car.

He finds that hired help, both on the farm and in the home, are less difficult to get and keep, and that they will take more interest in their work if he does not forget them once in a while in his "spins," and also his less fortunate neighbor in this world's goods seems to have a better opinion of him if he remembers them occasionally. He finds as the years come and go that his family does not think farm life such a drudgery after all. That his boys take more interest in farm stock and farm work, and somehow the city does not seem nearly so attractive as it once did.

The land owning man who is running ahead every year is the man who stays on the farm, and buys a motor car. By so doing he keeps on the farm the brain and brawn which belongs to it, and thus finds that the motor car pays.—R. E. Olds, President Reo Motor Car Company.

CARE AND FEED FOR THE BROOD SOW.

To the American Breeder: The brood sow should not be allowed to run among other stock, even with the stock hogs, as her condition is such that she cannot well keep out of their way, and the cuffs, bites and kicks often are very harmful to her and her unborn pigs, often causing abortion, and always affecting the size, strength and vigor of the pigs at farrowing time.

Where the brood sow follows fattening steers, too much corn is secured. The same is true if she runs with the fattening hogs, corn being too heating for her already conjested system, while the pigs she is producing require albuminous, flesh-forming sustenance, rather than carbohydrate for fat production. A little corn, however, will prove strengthening, keep up bodily heat during chill weather, and will be productive of no bad results where the sow is in prime condition. For the balance of her ration, an oil meal slop, formed of skimmilk and the meal, will prove most satisfactory.

One should always arrange to put the brood sow in a separate pen at farrowing time, removing her to this pen a week or two before the date on which she will drop her pigs. This accustoms her to her surroundings, cultivates quietness, and gets her used to being fed and handled by her attendant, so that she will not be cross, restless and nervous at farrowing time, all of which wields a beneficial effect on her strenuous work, and enables one to render prompt assistance in case it is needed. Simply remember: Everything that can be done to promote the good health and thrift of the brood sow, will be transmitted directly to her unborn offspring, and will account in large measure for whatever degree of strength and vigor they may possess—not only at birth, but for life.—M. Coverdell, Cole County, Mo.

Advertisers and Readers Endorse It.

To the American Breeder:—Your paper has sold every horse, and I am still receiving inquiries every day. I just received last copy (March 5), and think it the most instructive of all previous ones.—Wm. D. Whisler, Hancock County, Iowa.

We wish to thank the AMERICAN BREEDER for the good it has done us and will say, we consider it the best stock paper printed, with NO exceptions. Wishing the paper the best of success, we are, B. M. Boyer & Sons, Van Buren County, Iowa.

IT CERTAINLY IS.

To get at the importance of live stock in so-called dry farming areas, Professor Shepherd of North Dakota Agricultural College sent a list of questions to the directors of the experiment stations in the northwestern states. One question was, "Do you consider live stock husbandry essential to successful dry land farming in your state, and why?" The answers are as follows:

Thatcher, Washington: Yes, where rainfall is enough to grow forage.

Webster, Kansas: Absolutely.

Burnett, Nebraska: By men of small means designed to build homes; not for traction, and large farming work.

Carlyle, Idaho: Yes, most essential.

Forbes, Arizona: Yes.

Howes, Nevada: Yes.

Humbert, New Mexico: Yes, because dry land farms produce coarse feeds best and these can't be shipped.

Knight, Wyoming: Yes. To supply humus to soil and to maintain the fertility.

Wilson, South Dakota: Yes. To add humus and maintain fertility.—Kansas Farmer.

LICE ON HOGS.

To the American Breeder: A pig weighing 150 pounds will have approximately twelve pints of blood, each pint containing 7,680 drops, or a little over 92,000 drops of blood. If a louse abstracts a drop a day, and the pig is boarding several thousand lice, it is easy to see where the profit goes when "hogs don't pay."

It is worse than useless to "dope" the pig with "lice killer" without disinfecting pens, bedding and in the spring, the wallow.

First burn all the loose, dry straw, clean out manure; spray the pen floors, walls, beams, troughs and every crevice with a ten per cent solution of formalin or a half gallon of formalin to five gallons of water. Creolin may be added to wallow in warm weather, say half a pint to a large wallow.

Then dust on each pig powdered staphisagaria. This will cause the average louse to homestead elsewhere. —E. T. Baker, Veterinarian, Idaho Experiment Station.

LUNG WORMS.

To the American Breeder:—Pneumonia of hogs is not always due to worms, yet it is not uncommon to find young pigs, and even old hogs, to be affected, and dying from inflammation of the lungs and bronchial tubes due to the presence of large numbers of small white to whitish-brown thread-like worms which are found to be located in the bronchial tubes. This parasite is quite common in the United States.

Verminous pneumonia is most often found on low or swampy land, although it may occur on the uplands.

This disease of pigs occurs at all times of the year, but is more frequently observed during the late summer and early fall. When pigs are first affected, the symptoms are few and elusive, but as the invasion by this worm progresses the symptoms become more and more pronounced. At this stage of development, frequent spells of coughing are noticed.

There is a thick discharge from the nostrils which will at times contain masses of mucous. A close examination of this material will at times reveal the presence of young worms as well as adult worms. The symptoms most apparent to the owner are thinness and lack of development, due to the air passages being closed or to a watery condition of the lungs.

At times this disease may be confused with hog cholera or even with tuberculosis of swine. By careful study of the symptoms and history, together with the finding of the worms either before death in the discharges from the nostrils. or after death in the bronchial tubes at the base of the lungs, should be sufficient evidence to enable one to be sure.

It is very difficult to relieve hogs afected with lung worms because of the danger of injuring the lungs or air passages in undertaking to kill or dislodge the worms. "An ounce of prevention is worth a pound of cure." Be very careful not to introduce into the herd any hogs that are affected by the parasite. If you know that any low or swampy ground on your farm has been used as pasture for infected hogs, keep healthy hogs away from it. This is not an absolute preventive, as the trouble sometimes occurs in uplands as well as lowlands.—Dr. W. L. Boyd. University Farm, St. Paul.

Live Stock Receipts Heavier

Increased Farm Demand for Mares a Feature of Horse Market—Cattle Prices Still Good—Hogs Highest for the Year—Good Sheep Market.

A few weak spots have turned up in the horse market in the past two weeks, but the general tone was about steady. Claims to lower prices were made by shippers who have been handling a good class of horses, and took a turn to inferior or plain kinds. The result was that the difference in prices on a quality basis was surprising. The total volume of business going on in horses and mules is large. The demand for farming, all lines of construction work and for city use, is large. In the past two weeks every important market from Chicago west has reported large sales. In Miles City, Montana, horses are said to be worth more than in the Central West. Some large shipments have been made into the British Northwest, and the whole country is preparing for farm work. One of the most striking features of the trade is the demand for mares. Farmers are getting all the brood mares they can, and the general tendency is to get back in the horse business, rather than out of it. The entire Central West, West and Southwest is in excellent condition. Reports from Texas are that never previously was there a more promising spring for farmers. In the South seeding time is on and while cotton states are buying fewer horses they are still taking a good many mules. A good many traders are vociferating about the high prices, and at the same time predicting lower prices. They did the same thing last summer and the first two months this year, but that great big slump in prices has not come yet. Conservative dealers and traders say that demand now is of sufficient volume to insure a good market up to midsummer. July and August are usually the two months when receipts are small, and demand limited.

Current prices indicate what real quality in horses means. For instance sales were reported last week at $20 up to $350 a head. Those at $20, needless to say, were plugs of the commonest kind, while the top price $350, was paid for an 1,800 pound dapple gray four years old, well bred and well broken. More horses are selling under $200 than above that price, and a fair average would be $150 to $175 a head.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs. up.	$225@275
Drafters, fair to good	145@235
Chunks, fair to choice	125@160
Chunks, fair to good	85@120
Expressers and light draft	50@110
Plain workers	40@ 85
Southerns, good	125@145
Southerns, plain to fair	65@125
Plugs.	20@ 55
Mules—	
13 to 14 hands	$ 85@135
14 to 15½ hands	125@165
15½ to 16 hands	160@200
16 to 16½ hands	190@285

Unsettled Cattle Prices.

Last week cattle prices declined 15 to 25 cents, but in the preceding week about that much had been added to the market, so that the two weeks are about a standoff so far as net changes are concerned. The bulk of the beef steers coming now are selling at $8.25 to $8.75. In quality they show a better average than in preceding weeks. This is due to a longer feeding period, and the comparatively low prices of feed. Killers say that cattle are killing out well, and most of the steers coming now have been fed 90 days or more. The light weight cattle are selling relatively better than the heavy grades. Chicago reported a top of $9.15, St. Louis, $9.10, and the other markets $9. Practically all weights have figured in the top sales, but killers have shown a preference for the class weighing 1,150 to 1,300 pounds that carried finish. The demand, however, has been satisfied with less quality than the trade preferred, owing to the high prices. In other words, outlet channels that a year ago were taking steer loins are now using cow loins, chucks, and rounds. Cows are relatively higher now than steers were a year ago, and there is no low priced meat of any kind to fill out demand. The general scarcity both buyers and salesmen say will result in still higher prices in April. Colorado is making some good steers that have been fattened on sugar beet pulp. They are selling at $8 to $8.50. Some of the hay feeds are bringing $7.75 to $8.25. Texas and Oklahoma are supplying meal, cake and silage steers in fairly liberal numbers. They are selling at $7 to $8.10. Some Arkansas and Louisiana steers brought $6 to $7.50. The market has a drag over an unusually wide area and still total receipts continue short.

Quotations from the various grades of killing steers are as follows:

Prime corn fat steers	$8.75@9.15
Good to choice steers	8.35@8.70
Fair to good steers	7.75@8.30
Common to fair steers	6.75@7.70
Meal fed, choice	7.50@8.25
Meal fed, common to fair	6.75@7.50

Butcher Cattle Important Factor.

The scarcity of butcher cattle and no probability of the supply increasing in the next two months are conditions that give the killers considerable concern. Heretofore cows and heifers have supplied the cheap beef of this season of the year, but now fat cows are selling at $6.50 to $8 and heifers as high as $8.60. Veal calves sold up to $10.25 at Missouri river markets, and up to $12 in Chicago. Bulls likewise are high, the top being $7 to $7.50 at the various markets. There is no cheap beef in sight any place and the continued scarcity and high prices have contracted outlet channels greatly. Compared with two weeks ago prices are 15 to 25 cents higher.

The following quotations are for the various grades of butcher stuff:

Cows—	
Choice.	$7.50@ 8.00
Fair to good	6.00@ 7.45
Common to fair	5.00@ 5.95
Canners.	4.50@ 4.85
Heifers—	
Choice fed	8.25@ 8.60
Good to choice	7.50@ 8.20
Plain to fair	6.25@ 7.45
Common.	5.25@ 6.20
Veal calves	6.00@10.25
Bulls.	4.50@ 7.25

Small Volume in Feeder Trade.

In the past ten days fewer feeders have moved than in any previous period this year. The trade seems to have shifted the supply into final hands, and the nearness of the pasture season has cut off considerable speculative trading. Statistics show that in the first ten weeks this year more cattle stockers and feeders than sold in the same period last year. However, there was so much duplication, also so much young breeding stuff, that the actual supply for feeding will not exceed that of a year ago. Last week 5,000 four year old steers were sold by a Texas ranchman to a Chase County cattleman at $60 a head, $300,000 cash being involved in the deal. They will be pastured in Kansas. Such deals are few and when the movement to Kansas and Osage pastures starts in April short supplies will be apparent. Compared with two weeks ago prices for stockers and feeders are 10 to 15 cents higher, though in the past two days a moderate decline occurred. Feeders are selling at $7.75 to $8.40, and stock steers $7.50 to $8.25. Countrymen still want stock cows and heifers at prices ranging from $4.75 to $6.75.

The following quotations are for stock and feeding cattle:

Selected feeders	$8.00@8.40
Good to choice feeders	7.65@8.00
Plain to fair feeders	7.25@7.60
Good to choice stockers	7.25@7.70
Selected stockers	7.75@8.25
Plain to fair stockers	6.75@7.20
Stock calves	7.00@8.00
Stock cows	4.75@6.35
Stock heifers	5.00@6.75
Milch cows	35.00@90.00

Another Advance for Hogs.

Friday prices for hogs at Western markets were the highest this year, and the second highest ever reached in March. In March, 1910, hogs sold up to $10.95 in Kansas City and better than $11 in Chicago. This past week the top price in Chicago was $9.10, in St. Louis $9.15, and at Missouri river markets $8.90. While the general tendency in the market has been upward, there has been considerable unevenness in prices from day to day, owing to an uneven distribution in the supply. Monday Chicago received 70,000 hogs, and prices were set back 10 to 20 cents. Tuesday and Wednesday the loss was regained and in the past two days new high levels were attained. Compared with two weeks ago prices are 45 to 50 cents higher. Both traders and packers say that higher prices will follow. The quality of the hogs coming now is good. Most of them are heavy grades and the light and medium classes are selling at a premium. By the close of March the five Western markets will show about 1 million fewer hogs than in the same period 1912. The shortage is already 875,000.

The following table shows the range in hog prices in the past two weeks:

		Preceding Week.
Monday.	$8.30@8.60	$8.35@8.50
Tuesday.	8.35@8.70	8.20@8.50
Wednesday.	8.30@8.70	8.15@8.50
Thursday.	8.40@8.85	8.25@8.55
Friday.	8.50@8.90	8.35@8.70
Saturday.		8.40@8.75

The following quotations are for hogs:

Choice, 250@300 lbs	$8.50@8.80
Choice, 200@245 lbs	8.60@8.90
Medium weight	8.55@8.90
Light weight	8.00@8.90
Common to fair	7.90@8.65
Stags.	6.50@8.25
Boars.	4.90@7.95
Bulk of sales	8.60@8.80

Healthy Sheep Market.

Wednesday sheep prices were the highest of the past two weeks, but in the past two days lambs were quoted off 10 to 15 cents, and sheep continued up to the high level of the season. Compared with two weeks ago lamb prices are up 25 to 35 cents, and sheep up 40 to 50 cents. Colorado and the Northwest is supplying the bulk of the sheep. Montana and Idaho offerings are hay fed, and the Colorado supply has been fattened on grain. Some spring lambs in St. Louis sold last week at $14 a cwt., but it is doubtful whether killers can get more than enough of that class to meet the Easter requirements. Choice fat lambs are quoted at $8.50 to $8.75, fair to good $7.75 to $8.45, yearlings $7 to $7.75, ewes $5.50 to $6.65 and wethers $6 to $6.75.

WHAT A HALF-PERCHERON MARE IS DOING.

To the American Breeder: Regarding good brood mares, I have a half-blood Percheron mare; she is nine years old now, and weighs 1,500 pounds and works every day. She raised six colts, now four mares and two horses. They will reach the 2,000 pound mark. I have one 20-months-old mare colt which weighs 1,450 pounds; one nine-month mare, 1,000 pounds. Can show the colts—beat it, somebody.—W. J. Forman, Paulding County, Ohio.

Percheron and French Draft.

Stallions for Sale—Twelve head American bred, big bone, low down, blocky kind, from 2 to 4 years old. Sixteen registered crosses of our own breeding from the best sires obtainable. Broglie 41462 (55063), the greatest living son of Besique (19602), heads our herd now. These horses must sell. **G. B. Loper & Sons, Chesterfield, Macoupin County, Ill.**

SUNNY PLAIN FARM

OFFERS FOR SALE

Imported Percheron Mares and Fillies.

Mares are in foal to stallions approved by the French government. All grays. I take plenty of time in buying and buy no common stuff. 5 stallions for sale also. Big 3-year-olds; imported and home bred. Will sell worth the money—all to one man, if desired, and at a bargain. **W. C. Baughman, Pulaski, Iowa.**

REGISTERED DRAFT STALLIONS AND MARES

for sale; mostly Percherons. Also road stallions, mares and colts at prices to suit your pocketbook and full value; can furnish most anything you want. **E. P. Hamilton & Sons, Garden Grove, Decatur County, Iowa. R. F. D. No. 2.** We are 23 miles southwest of Chariton and 24 miles southeast of Osceola. (Station, Leroy).

STALLIONS AND MARES

For sale. Three young black, registered Percheron mares; 1 bay stallion, registered, 17 months old; 1 black stallion, registered, 6 months old. **T. H. Terry, Bavaria, Saline County, Kas.**

PERCHERON

AND FRENCH DRAFT

Stallions for sale. 7 head of extra good stallions, two to five years old; weight 1600 to 2260 pounds. The good kind at farmers' prices.

Geo. Groenmiller & Son, Pomona, Kas.

PERCHERON, BELGIAN AND COACH STALLIONS AND MARES, ALL AGES.

100 head to pick from; size, quality and breeding. We won over 50 first and second prizes and gold and silver medals at the Wisconsin State Fair. Grand Champion Belgian and Percheron stallion at head of stud. Prices and terms to suit. **Ives & Bellman, Delavan, Wis.**

FRENCH DRAFT STALLION

for sale; four years old past; 1800 pounds now in common flesh; he ought to make a ton horse when full grown in his old clothes. Lots of good colts to show, and mares in foal. Will sell him cheap for cash, or trade for a good Belgian or Shire. **M. P. Lydon, Cresco, Howard County, Iowa. Rte. 1.**

BLACK IMPORTED PERCHERON STALLION

for sale or exchange. Four years old; weight 1,950 in fair flesh; good breeder and a heavy boned, rugged horse. Want pure bred or grade mares, or young horses, or cattle of any kind. **A. S. Loveland, Mount Pleasant, Henry County, Iowa.**

Draft and Coach Stallions

A fine bunch of Percheron, Belgian, French Draft and Coach stallions for sale; priced from $350 up. I have the big ton kind that are right. Come and see me, or write. **J. M. Nolan, Paola, Miami County, Kas.**

FIVE PERCHERON STALLIONS.

From two to six years; very good. Stock all registered. Have to sell to change blood. The oldest one a ton horse. Most are black. **D. Teinert, York, York County, Neb. R. F. D. 4.**

PERCHERONS.

Imported and home bred stallions and mares, from $200 to $900 each. **H. Redenius, Rushmore, Nobles County, Minn.**

THREE PERCHERON STALLIONS

For sale at farmer's prices; two and three years old; sound; with extra good bone. **F. T. Wallace, Assumption, Christian County, Ill.**

HORSE BREEDING IN VICTORIA.

From various communications that have reached us, we gather that there is a movement in the state of Victoria, commonwealth of Australia, in favor of the founding of a Clydesdale Stud Book for Australia. As our readers are aware, one has already been started for New Zealand, and the Clydesdale breeders of Australia, and especially those in Victoria, are moving in the same direction. From information which has come our way it is to be inferred that some kind of pedigree register for draught horses already exists in Victoria. The book, if there be one, is unknown to us, but whatever its merits, it does not appear that in any sense it can be described as a stud book. What those who have made an effort to maintain the purity of the Clydesdale breed desire is not a register showing how draught horses may be or have been bred, but a stud book for a particular breed in which regard will be paid to the purity of breeding and the maintenance of the distinctive characteristics of the Clydesdale which will thereby be insured. It is admitted by Scottish visitors to Victoria that the best horses in Australia are to be found in that state. These horses are what they are because of Clydesdale lineage, which is the dominant strain in their breeding, and should Clydesdale breeding become mixed, Clydesdale qualities would cease to dominate.

What creates difficulty in Australia is the fact that a number of good horses of mixed Clydesdale and Shire breeding have been introduced into Victoria. Perhaps the best of these was the black horse Prince of Albyn, which won the Glasgow junior premium in 1886. He was got by Prince of Wales (673), out of the Merryton mare Jewel, which went to Mr. John M'Millan, Laigh Bent, Strathaven. She is generally understood to have been a Shire mare. But while there has been this modified commingling of blood in Victoria, it has been no more pronounced than at home, and it has not resulted in the sacrifice of any Clydesdale characteristic. The foundation of the Victoria draught horse race was wholly Clydesdale, and in spite of an occasional importation of something else, the type and dominant Clydesdale influence have never been sacrificed. Therefore the wise course to be followed now is to keep a firm hold of what remains, to include in the foundation volume as Clydesdales all that has been reputed as such, and on this foundation to rear a breed of horses whose blood lines will all trace to the pedigrees included in the first volume. The type can only be preserved by breeding true to the lines which have created the type, and these in Victoria have unquestionably been Clydesdale.

All the best Clydesdale stallions of the years 1850 to 1870, and perhaps later, were exported to Melbourne and New Zealand. Besides these many of the best mares went the same road, and these went to constitute the beginnings of that good class of horses still to be found in Victoria. What works havoc with any breed is not adhering to well defined lines in pedigree registration, but allowing fancy points to sway judgment in the show ring. As we have formerly indicated, the type presently fancied by many judges was not much thought of by Australian visitors last year. They could not understand the craze for "tall" horses. They wanted big horses with Clydesdale legs and feet. This is a type of horse which finds his size not in length of leg—which is no guarantee of strength—but in depth of rib, length of quarter, and depth of thighs. A horse can hardly be too tall, provided his height is obtained in the parts indicated. A big horse standing 17.2 h. h. on short legs, with sound feet, flat bones, and clean joints, is worth infinitely more than a horse of the same height with the closest possible action behind, but shallow in the rib, and deficient in muscular development behind. Let the Victorians establish a Clydesdale stud book on the lines indicated, and let their judges follow their present ideals in draught type, and they will not simply hold but increase the lead they presently enjoy for Australian cart horses.—The Scottish Farmer, Scotland.

BREEDING WILD MARES.

The greatest per cent of foals can be obtained by a stallion running loose with a limited number of mares, but a few mares is all one stallion will accommodate when this plan is used. A valuable stallion cannot be successfully used to the best advantage, as too many services would be made on each mare during one heat period.

One Western establishment has several large pastures so that when a mare is bred she is changed into another pasture and a record is kept of each mare so that in three weeks this mare is turned back to another pasture which is known as the "try" pasture. A stallion is hobbled and turned loose in this pasture and allowed to run with the mares. He cannot serve while hobbled, but the mares which are in heat are closely associated with this horse so it is easy to ascertain which mares are in heat and they are taken back to the corral to be rebred. One service is all that any mare gets at a single heat period. By this method a larger number can be bred by the natural service. When the mare is to be bred she is separated from the others and put in a small lot and the stallion is turned loose with her. As soon as one service is made the mare is taken back to another pasture.

If a mare is to be bred to a jack the same arrangements are followed out excepting a little more care in the selection of the jacks. A jack should be broken to serve loose. After he is ready the bridle is slipped off or the halter rein is unsnapped from his halter and he is let go gently to the mare. Where the natural service is made, the jack should be tall enough to make this service without a pit, and great care should be taken that the mare is in good heat and does not get the jack crippled or frightened.

In other sections wild mares are bred to jacks on the range without an enclosure. A stallion has a sursingle or a large web made of hair, beginning about two feet wide at the sursingle underneath and plaited into the tail in such a manner that the stallion cannot serve. The stallion keeps the band of mares together. The jack is turned loose with this herd. The stallion and the jack may have a few fights but after they become reconciled they run together nicely. The stallion is the herder and the jack does the serving. This plan is much used in Old Mexico.

During the last few years the capsule method of breeding has made it possible to breed a large number of wild mares by this method. The best plan for this is to build a chute where these mares can be quietly driven into a corral and let go on into the chute single file, so that a reasonable number can be made safe and solid by putting poles in front of them and behind where they cannot get away. While they are in this position the operator handles them quietly so that they are not afraid. This is carried on every day for a few weeks until these mares get familiar with being handled in this position so that they are not excited. After they are familiar with the chute and handled quietly they will go in very easily. There are some old mares that never give up.

Since a better grade of horses are being raised on the range it has been found profitable to corral the mares with the colts each day and watch the colts and tie them up and handle them so they will not be afraid. The old mares that are outlaws are usually separated from this band and sold or taken elsewhere. A few outlaws destroy the confidence of the younger ones. Mares can be handled gently a few times in a chute so that they may be bred successfully with capsules. Swinging ropes and other things of a similar nature should be dispensed with in handling range mares. A little more time will accomplish the same purpose and bring much better results in the breeding business.

SUCCESS UNDER DIFFICULTIES.

To the American Breeder:—I will tell something of my success as a graduate of Graham Scientific Breeding School. In going over my books for the year of 1911 I find that I foaled 90 per cent of brood mares that were bred. I see a good per cent of the mares bred in 1912 showing up.

Now, our country is devoted to the raising of cotton and cane and there are not so many good brood mares as in other states. I have mares that come for 25 miles to be bred by me, and as I am the only scientific breeder around, the people think it something wonderful. I also have the sorry class of mares to breed, but I make it pay. I make all mare owners abide by our laws in this state, which say when a mare is traded, transferred or moved from the country, the season is due and payable and we have a lien on her, so you see I collect for almost every service. This is the only way to stand a stallion or jack. The results of collecting on all mares bred that are traded or transferred is having its effect on the ones that were accustomed to breeding any and every old thing. That is, they are

IMPORTED STALLIONS

PERCHERON
SHIRE BELGIAN

Each year we show our New Importation the same month they land; each year they win more than all other exhibitors combined. At the American Royal this year we won 2nd on 4-year-old Percheron, 1st, 3rd and 4th on 3-year-old; 1st and 3rd on 2-year-old and 1st and champion on group of five stallions. All are for sale. Our guarantee and insurance are the best. Our horses the best.

PERCHERON IMPORTING CO. CHAS. R. KIRK, SOUTH ST. JOSEPH, MO.

W. A. LANG & CO.

Greeley, Delaware County, Iowa

Importers of BELGIAN and PERCHERON STALLIONS AND MARES.

We wish to announce to the buying public that we will now, as in the past, give you more good, sound, young horses for the money than you can get elsewhere. We do not advertise cheap stock because we do not think the best breeders want that kind, but we will sell you the good ones at as reasonable margin of profit as possible and do a remunerative business. All horses are backed up by our GILT EDGE GUARANTEE. Write for full particulars, mentioning this paper.

WHITE OAK STOCK FARM

American bred Percheron Stallions and Mares.

The best to be had of the breeder—can show sires and dams of most of them. Always a large number to select from at reasonable prices, considering the kind of stock. Address your wants to **D. Augstin, Carlock, Ill. R. F. D. No. 2.**

Carlock is on the L. E. & W. Ry., and thirty miles southeast of Peoria, ten miles northwest of Bloomington, Illinois.

PERCHERON, BELGIAN AND SHIRE

STALLIONS, IMPORTED AND HOME BRED. 3 to 4 years old, maturing 1800 to 2400 pounds. No finer lot in America. Prices and terms reasonable. Barns in city.

Lew W. Cochran, Office 205 Ben Hur Bldg., Crawfordsville, Ind.; Fort Morgan, Col.

IMPORTERS OF PERCHERONS

and dealers in American bred draft horses and Standard bred horses and high class jacks. Will sell at right kind of prices and terms to suit purchaser. Give us a look before buying elsewhere.

Fisher & Walker, Evansville, Indiana.

YOUR CHOICE OF IMPORTED PERCHERON AND BELGIAN FORD STOCK FARM stallions at $100 profit. Absolutely first cost revealed in plain figures; the best money can buy. Positive guarantee with every purchase. Correspondence, inspection and personal acquaintance solicited. Investigate. **Ford & Harrington, Parker, South Dakota.**

PERCHERONS

A few good stallions from 3 to 6 years old. Will price to sell in order to close out by April 1. They are good ones and all registered. **A. M. Walker, Laclede, Mo. Fairview Stock Farm. Route 3.**

150 STALLIONS.

Home bred draft stallions, $250 to $650. Guarantee to sell you imported stallions for less money than any firm in America. Come to a live stallion market and see all draft breeds. **A. Latimer Wilson, Creston, Iowa.**

IMPORTED AND HOME BRED STALLIONS.

I will sell imported stallions, $800 to $1,000, except two stallions. Home bred stallions, $300 to $600. Come and see my horses. **Frank L. Stream, Creston, Iowa.**

ceasing to breed them, consequently a better class of mares to breed.

I have paid quite a good deal of attention to the large jack measurements. I thought I had a fairly good jack myself, so went and measured him this morning. He stands 15½; heart 78 inches; arm 21 inches; below knee 10½ inches. He is six years old and his colts took first and second premium at our last fair. Bred this jack last season to 138 mares, making only one service per day.—T. W. Allinder, Faulkner County, Ark.

FAVORS THE "HALF DOWN" PLAN.

To the American Breeder:—I notice in your issue of February 20 an article written by a South Dakota mare owner on the methods that the stallion owner uses in conducting his business. The article shows that the gentleman has done some serious thinking on the subject, and it is well that mare owners are thinking of these things, because these problems need the best thoughts of both stallion and mare owners to effect their solution.

However, I think this gentleman has drawn some wrong conclusions in the matter. In the first place, it is necessary for the mare owners to know when their mares are in proper breeding condition and how to keep them that way. Breeding condition means that a mare possesses such a natural healthy tone in her system that she will get in foal when live spermatozoa are introduced into her uterus. Progressive stallion owners who use scientific methods must necessarily reject mares which are not in breeding condition, but the owner should begin immediately to use corrective measures to overcome this condition and make the mare a producer. It is the producing mare that is the profitable mare to both stallion and mare owner.

Now, as to matter of service fee: there is nothing that will help the stallioner sort mares so much as to charge at least half at the time of service. Men owning doubtful mares would not be so anxious to rush them away to the stallion as soon as they came in heat each spring, and it would be of no advantage to the stallion owner to breed them because he has to return the advanced fee when it is known the mare did not get in foal. Collecting in advance will not tempt the scientific man to make too many services with his horse, because that is the same principle as a farmer selling every pound of his crops off the place each year for cash. I think the payment in advance plan is bound to come, because it appears to be more profitable to both stallion and mare owner. The important part, however, is for the mare owner to keep his mare in breeding condition at all times, because that is now the limiting factor in colt production. Too much work, improper feeding and irregular management ruins many a mare as a breeder. Mare owners must be careful and not create mare troubles and stallion men should not spread them.—Ernest Clawson, Butler County, Ohio.

THE COLLECTION DIFFICULTY.

To the American Breeder:—I am going to write what I think the stallion law should be in each and every state where pure-bred stallions are kept for public service. Here in my neighborhood there is a pure blood registered Percheron stallion, and as good as money can buy. There were bred to him in 1911, 70 mares by natural service and he got 80 per cent of foals. Yet with this showing he barely "breaks even." Charges are $16 to insure with foal. There are mares bred to him and then they are traded to Tom, Dick and Harry, and by the time fees are due they have changed owners so many times, and often sold and gone out of the country, that collecting the fees is impossible. Now what we want is a stallion law giving owner of stallion a lien on the mare and foal for one year from date of service; if owner of mare trades or sells, the fee becomes due at once.—L. O. Case, Grant County, Oregon.

ILLINOIS STALLION LAW.

To the American Breeder: I notice also in a recent issue considerable about the stallion laws and Mr. C. B. Dannen of Marshall County, Ia., touches upon the subject pretty thoroughly as to the Iowa law. We have had a law here in Illinois since January 1, 1910, and I fail to see just where it has done any good any more than to give the veterinarians a little extra business. Some advance the theory that it compels the man with a grade stallion to advertise him as he is, and that is true enough. But I know of stallions that are grades and a great many people believed that the license number was a registry number. On the other hand, I know of grade stallions that have sired better horses than some pure bred stallions, but I do not wish to go on record as advocating the use of grade stallions, for I do not. I contend that the mongrel bred stallion should not have any license number; the grade should have a number, but it should not be printed any larger than the smallest type used on the advertisement and the pure bred should use the license number as large as the largest type used on the advertisement and each bearing its distinction—MONGREL—GRADE—or PURE BRED in the largest type used on the advertisement.

While I favor a stallion law in a certain form, I believe that the law should fix the charges made by the veterinarians for I have heard of some that have charged as high as $10, while I believe that $2 would be sufficient for the service rendered and we are obliged to pay $1 each year for a renewal, which I am under the impression is unnecessary. After a license is issued that a renewal would be only necessary where the animal had changed hands, so that the board could keep track of same.

As to the examination, is it really any use as it is required at present? A blemish that is brought on by an injury may not be transmissable, and where a stallion is disqualified under such condition I say it is wrong. Two diseased mares in a locality will do more harm than all the defective stallions in the state.

And why not have it included that the stallioner have a lien on the mare as well as the colt, until the foal bill is paid, which would be a protection to the stallioner as well as the mare owner that honestly pays his bills. However, I have had very little trouble in this direction, though I know of some that have.

The only amendment, that I know of, to our Illinois stallion law, was at the time that the Department of Agriculture withdrew its recognition of the different registry associations. I hope that our Illinois lawmakers will take the stallioner's interest to heart and get the affairs on a more economical and satisfactory basis to all directly concerned, since this business is not as profitable as some believe it to be and especially so where one has $2,000 or $3,000 tied up in one animal.—Chas. J. O'Neill, Kankakee County, Illinois.

"START THE LESSONS AT ONCE."

To the American Breeder: On the subject of studying horse breeding at home, I should say, start the lessons at once. Those subscribers objecting to modern methods advocated by the American Breeder are in need of a guardian. Some people are too nice to call a spade a spade. Every man, woman and child needs the good rules of the American Breeder. Every progressive farmer and breeder should be glad of the chance to secure the information they can get in the American Breeder. It is good for reproof, correction and instruction. Push it. I was much interested in Mr. Txcell's idea of developing horses. He is on the right track. I wish him success. I. D. Graham has solved the great problem that the farmers are up against. I pulled the buck rake, fought the billy goat to a finish, and helped to set up the first mowing machine, the old one-wheeled Tinker in Ashtabula County, before the implement dealers came on deck. Theories look well on paper but a practical test is better. The farmer needs better help outdoors and in. Some one must find a way to enlighten him on these needs of better stock of all kinds and how to care for it. Why not the American Breeder? Then take a course at the Graham School. Yours for better stock. — E. A. Rickard, Ashtabula County, Ohio.

TROUBLES OF THE STALLION MAN.

To the American Breeder: I have been reading some of the mare owners' writings and don't believe there is one in a hundred that ever kept a stallion or jack for public service, and therefore don't realize the aggravation there is in the breeding business, and what the horse and jack men have to contend with. You will understand I am not hitting all the mare owners, but I am trying to put a plain picture in your mind the way some of them treat the horse man. For instance, the horse trader, the man that buys and sells, the hard horse master, the man that tries to tend too much land and has all kinds of hired help to pound the mares on the back, and worst of all is the man that parts with the mare and tells the man that gets her she is in foal to a certain horse or jack, and he must pay for the colt, and goes and tells the horse man the mare is not in foal or he would not have parted with her, or if she is the other fellow pays for the colt. Well, such a mare as this changes hands until the shipper gets hold of her and she may land in New York before foaling time, and then what? The horse man would have an easy time hunting this mare up and if she had a colt, collect his $10 or $15, whatever it might be. Whenever a mare owner comes to me and asks before he breeds what I will charge to breed his mare, that he intends selling her, and it will be easier to sell her if she is bred, I breed her for half price right then, privilege to the season, and that settles it. That kind of a mare owner is all right. The mare is entitled to the season, no matter who owns her. Some men will breed, get a colt to stand and suck apparently all right and a fine colt, but if he finds the colt out in the pasture dead in a few days after foaled, it was no good, never was right, and all such things. Of course, the mare owner has lost more than the horse man in that one colt, but it is not very encouraging to a man to keep a stallion or jack and be turned down after filling the insurance and try to deal fair and square. Some of you mare owners get a thousand or fifteen hundred dollar horse or jack and try it a while and see what a get-rich-quick scheme it is to sit around and wait on mare owners in the spring of the year, feeding lots of high priced feed and losing time enough to raise a spring crop that would bring twice as much as your horse or jack. The mare owner only loses a few hours at a time taking mares to the horse and the horse man loses a whole spring of valuable work and if he wants to buy some feed of his patrons, they want the cash, and generally more than the market price, and don't wait till the horse man gets pay for a crop of colts. They know he has to wait

PERCHERONS TO BE DISPERSED.
A change in business makes it necessary for me to dispose of my Percherons. I have a 5 year old stallion by Tremont 33647, dam Suzanne 17340. I have some mares 3 years old and in foal. These mares combine size with quality and action; some weighing a ton. Mares sired by Nicholas 21997 (43394) and out of good mares. These horses are all of G. L. Carlson's breeding. It is worth your while to come and see this stock. **Dr. P. L. Benthack, Platte Center, Neb.**

YOUNG PERCHERON STALLIONS For Sale
Some of them by the famous sirs
NICHOLAS 21997 (43394)
GEORGE HIRSCHMAN, PIERSON, IA.

MAPLE POINT PERCHERONS
60 HEAD FOR SALE
CRANDALL & DANFORTH, Randolph, Minn.

PERCHERON STALLION
For sale. High bred grade, coming 3 years old; weight 1750 pounds. Will sell or trade. **Olson Bros., Assaria, Saline County, Kas.**

PERCHERONS

Eight home-grown stallions, the "Big Type," 2 to 5 years old, ready for heavy service. Also weanlings and yearlings. Bargains. South Central Iowa. Fast trains. **Fred Chandler, Route 7, Chariton, Iowa.**

BARGAIN IN A ROUGH STALLION.
I will take $400 for a good 4 year old imported Percheron stallion, Jurvigny (84150) 82336. This horse is black with white markings. We stood him last season, and he got away from the groom, while breeding a mare. He has been hard to handle since then and I am too old a man to handle a rough stallion. Come and see just what he is. **C. B. Dannen, Melbourne, Iowa.**

PERCHERON STALLION
For sale. Black; coming 5 years old; weighs a ton; is a sure breeder; is a high class horse and has the best of breeding. Will be sold cheap. **W. J. Kemp, Marion, Linn County, Iowa.**

Three PERCHERON Stallions
For sale. All registered; coming 3, 4 and 8 years old. One weighs better than a ton; others will mature to 1900 pounds; heavy boned; brilliant blood lines. Can show colts from two. Price reasonable. Write, or better, come. **John C. Rohrs, Napoleon, Henry County, Ohio.**

IMPORTED STALLIONS
$600 to $1000

Home Bred Stallions $300 to $600. Mares, safe in foal, $350 to $500.
Don't write for our catalog but come. We have all the draft breeds.
Watson, Woods Bros. & Kelly Co.
Lincoln, Nebraska

THREE DRAFT STALLIONS
for sale. 6 to 8 years old; 1850 to 2100 pounds; 2 Percherons and 1 Clydesdale; all registered. Good breeders, but their fillies are in their way.
Five Jacks for sale also; the big kind, 15½ to 16 hands; black with light points; yearling to 6 years old.
Five Hereford bulls—long yearlings and good.
J. R. Brooks, Cairo, Mo.

REGISTERED BLACK PERCHERON.
Seven years old. Will take good jack or Percheron stallion or young mares, or will make a liberal dissount for cash. **Isaac C. Lohman, Turney, Mo. Route 3.**

a year or two on some of them, if it isn't but a ten dollar bill. I will leave to any stallioner if this isn't just about the truth, so please don't get mad and cuss the American breeder, just hop on to—A. M. Ewbank, Woods County, Okla.

THE NEED IS FOR AN EDUCATED DEMAND.

To the American Breeder:—I noticed in the last issue of the American Breeder an article written by a mare owner who desires that the stallion owners should be better educated and that more laws should be made favorable to the mare owners, to the restriction of the stallion owners.

It is clear, in reading the article, that the writer has had some experience with unscrupulous stallioners, and his plea is for more honest dealings from stallion owners and not for better sires. If more honesty is required in the horse breeding industry, it is up to the mare owners to get it, and in order to get it they need more and better education on the breeding question. In the first place, but a very small per cent of the stallions (19 per cent, I think it is said), are pure bred and registered. Is this the stallion owners' fault? Just as soon as mare owners demand none but the best registered sires, just that soon will the country be supplied with that kind, for the people always get what they want, and only a glance at the advertising space in the American Breeder shows that there are plenty of this kind to be had at reasonable prices. In the second place, the pure bred, registered stallion has to compete with the scrub in every way, including price, stand and suck insurance, "get your pay if you can" and "pay me anything from the regular price to a rooster" as a service fee. Is it any wonder that the stallion owners who have invested $1,000 or more in cash, which has come to them by hard, industrious labor, are forced to take in all the mares possible in order to make anything at all on their horses?

Put yourself in the stallioner's place for a few years; invest your money in a good horse, paying the price of a good horse, but if you are buying for public stand you must buy the kind that most of your patrons want. You then are told by your patrons what to charge and how to insure. You then are promised mares long before the season. Some arrive, some don't, and you learn that your competitor on the other road makes it a "little less" for several mares. You are found fault with if you don't make cuts, and lose patronage of the small breeder if you do. You are supposed to breed everything that is in fair flesh and work order and if you refuse to breed a mare belonging to a poor renter who has had little feed and consequently poor stock, you are censured by the whole neighborhood, who will say you were afraid you wouldn't get your money. Your patrons even find fault with the way you handle, feed and exercise your horse. In fact you must humor the whole neighborhood in order to make your horse pay. You run the risk of getting your horse hurt and, in fact, risk your own life to breed wild young mares for a patron. You have to take three months of the year away from your work to attend to the stand, and feed and care for your horse nine months longer in the year.

It is this condition to a more or less degree that confronts every stallion owner who has to deal with the average farmer who wants something for nothing and sees an easy way to get it. I want to be fair with the mare owners who have their risks to run also, and who are honest in their beliefs that the stallion business is purely a graft, and want just as many privileges as the other fellow. But at the same time I believe that this condition isn't caused by lack of honesty in the breeding business, but lack of knowledge on the part of the mare owners. Whenever the mare owners learn to fully appreciate a good pure bred sire that sires good colts, realize the difference in value and profit of raising good colts sired by such a horse, over those of a scrub. And further, when mare owners will breed to stallions of the same type and breed as their mares and conscientiously look for a stallion who possesses quality and prepotency of the desired breed, and patronize him for the sake of producing better horses and not consider a dollar or two difference in the fee; then and not until will the horse business be lifted above petty differences and put on a firm and solid basis.

In other words, if mare owners were all sufficiently educated in animal husbandry and horse breeding to first want to hunt the right horse, and then recognize him after seeing a crop or two of his colts, there would be little need of any laws, except governing soundness, which is the work of a veterinarian. The honest stallioners and the best registered sires would be in demand and the profit and sure pay sufficient to keep plenty of good horses in every community and in good hands.—F. B. Barr, Page County, Iowa.

THE "PAY AS YOU GO" PLAN.

To the American Breeder: I would like to say a few words in regard to the collection of stallion or jack service fees. Now I think the man to blame is the owner of the jack or stud. If he will breed by the season only, he will know where he is at every night. There are a great many that will object to this way.

Now are you going to run your own business or let the other fellow? The stallion or jack man had better breed ten mares at $10 the season, than forty to insure; he will have more money at the end of the season. There is just as much sense in wanting the man that you buy your seed, oats, corn or grass from to insure you a crop, as a stud man to insure a colt. Now if a stalilon or jack cannot make a man a good profit every year, what is the use to keep him? There are none of us in the business for glory; it's the money.

Now the sooner the stallion and jack men get to breeding that way, the sooner they will make money that way. There is no use to bother to make laws to collect for a colt, if the breeding is done by the season, as the man pays or gives a good note at time of service. Another thing, it puts a stop to fooling with a lot of mares that were never known to have a colt; the owner will not spend money on such a mare. Another thing, the stallion or jack will get a larger number of foals by the season, as the mare owner will look after his mare and bring her on time, and when she is settled, will not try to pull the colt out, as he has paid and wants his money's worth. Otherwise he does not care so much, as under other terms he does not pay unless the colt stands and sucks. A great many will object to this way of breeding, but stand pat and let them go somewhere else. They will come to it, if not you have lost nothing. Sell your horse or jack after about two seasons and go to doing something else, as you cannot make a living by breeding to insure. In my county I know of a great many company horses that were bought at a long figure, that never paid one per cent to the stockholders. I know another person that bought a trotting bred stallion for $1,000 and for four straight years bred one hundred mares at $15 the season and got the money and got 90 per cent of foals.

Now show me a man that stands a stud to insure who has done that in foals or money each year. The breed-

"AMERICAN BRED PERCHERONS"

Anthon 25137 (45446) by Besique (19602), at head of herd. We have on hand several fillies and stud colts sired by Gouveneur 55323 (70200), for sale. Also a black stallion of fine quality coming three years old in July, for sale. Come and get a colt where you can see the sire and dam. Onarga is eighty-four miles south of Chicago on the I. C. R. R., and about seventy-five miles east of Peoria.

H. KNOCHE & SONS, Onarga, Ill., R.F.D. No. 2

PERCHERONS FOR SALE AT RIVERSIDE STOCK FARM.

A fine lot of registered Percheron colts broke to service, weighing 1,600 to 1,775 pounds. Two-year-olds that weigh from 1,450 to 1,650 pounds; good colors of black and grey. These are the big bone kind and any colt out of eight head will mature into a ton horse or better. Imported and home bred mares for sale, including a span of well broke black four-year-olds I'll sell cheap.

Also four Mammoth bred jacks, 15 to 15½ hands high; all young; black with light points.

It will pay any breeder to come to our farm and look this stock over before buying. **O. L. THISLER, CHAPMAN, DICKINSON COUNTY, KANSAS.**

150 miles west from Kansas City on the Union Pacific, main line.

IMPORTED PERCHERON AND BELGIAN STALLIONS

Not so many, but the right kind. If you are a customer for an extra good, big, rugged, coming 3 or coming 4 year old Percheron or Belgian stallion, those are the kind I have; including one colt by Carnot. If interested, write or come and see me.

J. R. JUSTICE, **GALESBURG, ILL.**

At Union Hotel. Bell Phone 237, or Union Hotel.

On C., B. & Q. and Santa Fe Railroads.

HOMEWOOD STOCK FARM

Percheron, Belgian, Shire Stallions and Mares

Now is the time to buy a good stallion or mare. We have the kind you have been looking for. Our horses arrived home in October and are now perfectly acclimated and in the best of condition to do you a lot of good.

The Percherons are two and three years old, with size, bone and draft horse quality—many of them weighing over a ton, and not fat.

Our mares are of the best brood type; all are in foal and plenty of ton mares to select from. Every animal guaranteed sound, and a satisfactory breeder. Others say we have the best bunch of two-year-old Percherons they ever saw; you will say the same. Come and see us or write for full particulars. You will find horses right, terms right and prices below others of equal merit. We have also a lot of big, heavy boned, American bred stallions at surprisingly low prices. Don't buy until you have seen our stock.

Homewood is on the main line of the Big Four and I. C. R. R., twenty-three miles south of Chicago. Trains hourly to and from the city.

S. METZ & SONS, Bell Phone, Homewood 58 W. Homewood, Ill.

PARAMOUNT STOCK FARM

BREEDS AND IMPORTS

PERCHERONS, BELGIANS AND SHIRES

My November importation is ready for business. My two year olds are weighing 1,860 to 2,000 pounds; three year olds and over, 1,900 to 2,250 pounds. They are high class and sound. I am making prices that sell. I will pay any man's expenses that can say he is disappointed in the size and quality of my horses. Seventy-five head to select from. Write your wants. Send 10 cents in stamps for large picture of the horse parade.

Experienced Groom Wanted.

WM. CROWNOVER **Hudson, Iowa**

Stallions and Mares

At Bargain Prices

PERCHERONS, BELGIANS and SHIRES

NINETY-EIGHT HEAD FROM WHICH TO SELECT.

Forty Percheron stallions 2 to 4 years old; blacks, greys and a few bays. All registered in the Percheron Society. Several of these two year old will now weigh from 1800 to 1950. Price $500 to $1000. Three a little higher.

Fifteen Belgian stallions, 2 to 5 years old; bays and sorrels; two-year-olds that are weighing a ton. Price $500 to $1200.

Thirty Percheron mares, 2 to 8 years old; blacks, bays and greys. All registered in the Percheron Society; 22 showing heavy in foal. Price $300 to $700.

Ten head of Shire mares and stallions that I will sell at bargain prices. All of these stallions have been examined and found to be sound and of pure breeding, and certificate of such will go with each horse. If you want a real bargain in an imported or American bred stallion or mare, come right away as I mean business

L. R. WILEY, Emporia, Kans.

ers can be taught to breed by the season the same as the railroads have taught the people to pay for a ticket to ride on the cars. You would not think of going to the postoffice and buying stamps if you did not have the money. Why? Because you would be turned down. So with breeding by the season, teach them.—W. H. Senier, Weld County, Colo.

STALLION MAN DEFENDS STALLION LAW.

To the American Breeder: There seems to be a lot of dissatisfaction among the stud horse men with the stallion laws of the different states, and so far we have read very little in defense of them, so it might not come amiss here to say that in our humble opinion the enactment of these laws marked a long step forward in the horse-breeding industry in this country.

I believe that taking the farmers of Kansas as a body, not more than 10 per cent of them could tell a genuine from a fake pedigree, and no more than the above percentage pay enough attention to examine a stallion for soundness before breeding.

No doubt many readers of this paper will take issue with me on the above statement, and I ask them to remember that the readers of this paper are as a rule far better posted on matters pertaining to the horse than those who do not read it, but unfortunately this paper is not circulated as widely as it will be in the near future.

Just as long as men can stand grade stallions as pure breds, and unsound stallions pass unnoticed for want of being advertised for what they are, just that long will you see the grade and inferior pure bred get the business on their cheaper service fee. It can do no possible harm to the sound pure-bred stallion to advertise that he is such, and if he is unsound or in any other way a fake it is the duty of every horseman who is worthy of the name to let the fact be known to men who are intending to patronize him.

It is genuinely amusing to read a letter like that which appeared in the issue of February 20, over the signature of Mike Quint, Ellis County, "A little nonsense now and then is relished by the wisest men," we even enjoy the articles by Peter Tumbledown, in Mr. Atkinson's paper.—William Beck, Montgomery County, Kas.

SUGGESTS A STRINGENT LAW.

To the American Breeder: I see in your issue of February 20 an article which appears above the name of my friend from Decatur County, Iowa (Mr Luce). In this article he tries to insinuate that a stallion lien law would be an injustice to him. Well, my friend, no matter how strong the stallion lien law is, it will not hurt the honest mare owner. It is the wolf that we want to catch, the one that is doing so much hallooing; you know that when one gets hit he will always halloo. I am afraid, my friend, you are riding in the wrong wagon.

But I will agree with my friend from Decatur that the trouble with the stallion business is that there are not enough colts foaled (and not enough of the ones foaled paid for). What is the reason there is only 33 per cent of the mares bred in the United States produce foals? Is it the stallion or the stallion owner's fault? Or has the mare and her owner anything to do with it? If I was to place the blame I would put 97 per cent on the mare and her owner and about 60 per cent of that 97 per cent on her owner. Last season my brother and myself bred seven of our mares to my two stallions and got 100 per cent in foal (with one cover each), but I did not do so good with all of my neighbors. The reason is the mare owners will work and starve their mares until one can count every bone in their body, and then expect her to produce a good colt (and if not fix all the blame on the stallion). Men have brought mares here to breed that were so poor the stallion's front legs would catch on her hip bones and he could hardly get off. Any mare owner that treats his horses thus should have a guardian appointed to look after him. I think there should be a law passed to prohibit a man breeding any old scab of a mare (everybody knows that a stallion owner does not care to have them bred to his stallion). Make it a misdemeanor for a man to ask a stallioner to breed a mare for him that is affected with any contagious, transmissible or infectious disease and punish him by a fine of $100 or thirty days in jail. I think that would stop the spread of such diseases. The man who owns a horse should know what is wrong with it. A stallioner is not a veterinarian. You do not think for a minute that I would let my imported Belgian stallion cover a mare that has Dourine or any like disease any more than you would stick your hand in the fire and burn it off. Mr. Mare Owner, if you will give your mare good care and the proper treatment you will get more colts. Some people make a big noise about how many mares a man should breed with a stallion in one day, but they do not say one word about overworking the mare. You need not think that a stallion will get a colt by covering a rat hole; give your mare as good care and treatment as a stallion gets and then if you do not get a colt it is not your fault. Before I owned a stallion of my own, I used the best and highest priced stallion in this part of the country and I got a colt every leap. How is it with you? Now, my friend, if you get in the right kind of a wagon, I will ride with you.—F. W. Moeller, Calhoun County, Iowa.

THE STALLION SIDE.

To the American Breeder: The loss of life among the mares and colts from various causes in the spring and summers of the past, indicate only too clearly the wisdom, if not necessity, of some form of protection to the stallion owner. It is generally conceded that all the science, all the labor involved in standing a stallion should bow helplessly to the "stand and suck" theory, taken from old fogy days and suggesting mere "boy's play" and means no business at all.

You ask an M. D. to look at you; his fee is $10 (if you die it is the same); ask a lawyer to answer you a question; fee is $10; neither will guarantee anything; yet the horse goes a begging for his fees. In this land of inexhaustible fertility we have dead beats enough without making a dead beat of a fine stallion. The lien law is costly; the stand and suck theory is dangerous; the only way is pay as you go; it is as fair to one as the other and is the only legitimate way of breeding or standing a stallion.

A farmer's time is worth $10 an hour; his $5,000 stallion's time is worth $10 an hour. It remains, then, for man with all his boasted prowess and inteligence to protect his capital, his horse and his time. It is the power of the horse that is back of all the commercial products of the land; it is his staid qualities, his dependence, his strength that must not be tampered with; no man should begrudge his fees. Every man should pay for his services on the spot and be glad to support him. A man who will trade and traffic and evade this support is not worthy of his services. The stallion owner does not charge you for a colt, if he did it would be worth $200 and he would be the owner of one-half at least of that; but he only charges you for his time and labor and the time and labor of his stallion, which is quite reasonable at $15, and this is due at time of service, just like any other employment or service.

What if your colt did not stand and suck, the stallion's time and the stallion owner's time is worth as much as your mare's time and your time. If your mare cannot raise a colt that will stand and suck it is not the stallion owner's fault. But it does behoove you to put more money in a mare that will raise a colt that will stand and suck, and be on equal basis with the stallion owner. Put your mare on a progressive basis and the stallioner will meet you half way. The progressive side of all things is that all men in their dealings be fair with each other. Pay as you go.

As the production of good horses increases each year the service fee comes down. In this age of rapid progress it is sometimes difficult to grasp the full significance of an important progressive step such as the stallioner is putting up today. All the science of any calling is used, but when you sum up the extraordinary, cold dollar for dollar, the stallioner is giving it to you. His ability must be recognized and paid for on the spot. Mark out the stand and suck theory in your vicinity, and please do so at once.—Geo. W. Riley, Macon, County, Missouri.

PONIES ON THE FARM.

To the American Breeder: Now that the spring time of the year is drawing near, it might be well for lovers of the horse to bear in mind the necessity of saving the strength of our horses to battle with the coming season's work. How many of us there are who cannot spare our horses easily to run to town or on errands, especially during the rush of the planting of the crops, haying, ets.!

If a farmer were to figure closely he would find a saving by having a pure bred Shetland pony. There is very little cost in keeping him, as he will live on what a big team wastes. He is always ready and safe and willing for wife or children to hitch up at any time and run errands, or for the children to take a pleasure ride to a neighbor's or to town. A pure bred Shetland pony should be on every farm and with every family where children are growing up, for he is not a toy, but a useful little animal as well as a great source of amusement. He is a little companion that does love to be petted and fed dainties, apples, or other fruit. Nothing

TRUMANS'
CHAMPION STUD

The world's greatest collection of Shire Stallions and Mares, Percherons and Belgians to suit the most critical buyers; Hackneys of Richest Breeding and Strongest Individuality.

Fifth 1912 Importation of Shire and Percheron and Belgian Stallions arrived Oct. 29. Thirty-four years in the business and not one dissatisfied customer.

At the four great state fairs of Illinois, Iowa, Minnesota and Wisconsin, our horses have won this year no less than 15 champion and 48 first prizes, 9 cups and four gold medals, in the very strongest competition, and the champion stallion at Nebraska State Fair was imported by us.

Address for illustrated catalogue and other information, mentioning the American Breeder.

Trumans' Pioneer Stud Farm
Bushnell, Illinois

GALBRAITH'S CLYDESDALES

Are as familiar as a household word. Present stock includes first prize winners at all the leading state fairs. The only firm in the west owning an international champion. By far the oldest and largest Clydesdale importers in America. Address or call on.

ALEX GALBRAITH & SON :-: DE KALB, ILLINOIS

Formerly of Janesville, Wis.

CLYDESDALE HORSES

Stallions and mares of all ages for sale.

Also Shorthorn Cattle.

W. A. DeMerritt

Route 2, Plainfield, Ill.

SHIRES FOR SALE.

A six year old stallion; weighs over a ton; well broke to work; gets 75 per cent of mares in foal. State certificate of soundness furnished. Must sell on account of his colts. Have his colts to show. Recorded. Price $800.

Also fillies from weanlings up, and mares in foal. All sound and recorded. Prices on them from $200 to $550.

B. M. Boyer & Sons, Farmington, Ia.

SHIRE AND PERCHERON
Stallions and Mares.

Imported long enough ago to be thoroughly acclimated and in thrifty condition. Good horses with quality at reasonable prices. Inspection invited. Will meet you at C. R. I. & P. or Interurban Ry., if notified. H. P. Wilkinson Bros., Mitchellville, Iowa.

REGISTERED STALLIONS.

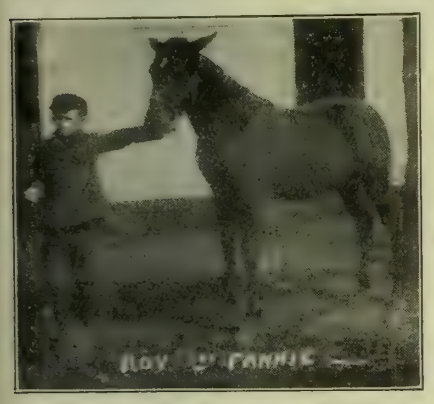
Four Clydesdales and one Percheron coming two years old; all big fellows with plenty of bone and quality. John H. Chambers, Edinburg, Johnson County, Indiana.

THREE CLYDESDALE STALLIONS

for sale, coming four and three years old. James Spear, Stanwood, Cedar County, Iowa.

pleases my ponies more than to see me come with a basket of apples for them to eat, and if I take a basket of peaches for them to eat there is no danger of them swallowing a pit, but will clean the meat all off and spit out the pit. A pure bred Shetland pony is a very knowing little animal and can easily be trained to perform many pretty tricks.—W. H. Fulcomer, Republic County, Kas.

AMERICAN BREEDER BOYS' CLUB



Colt Exhibition

Class for Boys 6 to 9 Years.

1st Prize—Roy. Goldsberry, Marshall County, Kas.

2nd Prize—Howard Boehne, Adams County, Neb.

To the American Breeder: Please find enclosed a photo of my colt, Fanny, and myself. Fanny is black and she was six months old on Sep-

tember 16 and photo was taken September 21. She then weighed 610 pounds and measured 55 inches high. Her mother is Topsy; she is Percheron and Morgan. Fanny was sired by Jonas, an imported Percheron, weight 1,900. Topsy has worked all summer and raised Fanny. Fanny has had one quart of oats three times a day. I have a full sister to Fanny, her name is Nellie; she is black also. Papa gave them to me. I was 8 years old the 14th of December. My papa takes the American Breeder. You must overlook it about Fanny looking downhearted; she never had the halter on till half an hour before the picture was taken.—Roy Goldsberry, Marshall County, Kas.

FROM THE BOY IN THE FIRM.

To the American Breeder: I am a boy 10 years old and I live on a farm. My father takes the American Breeder and thinks he cannot get along without it; he always looks it over first of all his mail.

I have a black pony 50 inches high and a new pony cart to match. I drive her two miles to school every day and take my younger brother and sister. It only takes us fifteen minutes to go. My father and I raise registered Percheron horses; we raise a few colts every summer; last summer we raised five. I like to feed them; they are all big heavy fellows, lots bigger than my pony now. Papa says they will weigh 900 pounds each. Ray Newbold, Kearney County, Neb.

WILL OUR BUFFALO POPULATION INCREASE?

W. B. Slaughter of Texas, recently sold 82 head of buffalo off his ranch near Amarillo, and they were delivered overland to the purchaser's ranch in Colorado, a distance of about 400 miles. These buffalo are to form the nucleus of a herd which is expected to increase rapidly under the favorable conditions of its new Colorado home.

There is a herd of buffalo on a ranch near Dalhart, Texas, which attracts a great deal of attention, as the grazing animals can often be seen from the Rock Island trains carrying mostly eastern tourists to and from the West.

ADVERTISING BRIEFS

If you are in the market for stallions, jacks or cattle, it might pay you to investigate what J. R. Brooks of Cairo, Mo., has for sale.

Joe E. Wright of Junction City, Ky., has a change of ad in this issue. Look it up.

Some young Percheron stallions are offered for sale in this issue by George Hirschman, Pierson, Iowa, some of them by the famous sire, Nicholas 21997.

Crandall & Danforth of Randolph, Minn., start their ad in this issue. They have sixty head of Percherons for sale.

Craig Bros. of Pittsville, Mo., have a saddle stallion for sale in this issue which they will price right for quick sale.

A black Percheron stallion is offered for sale cheap by W. J. Kemp, Marion, Iowa. The ad appears in this issue.

John C. Rohrs of Napoleon, Ohio, has three Percheron stallions advertised in this issue that he will sell at a reasonable price. See the ad.

Henry Lefebure, the well known horse importer of Fairfax, Ia., informs us that he is in receipt of a cablegram from Belgium announcing that his spring shipment of Belgian draft stallions, put aboard ship at Antwerp, Belgium, February 22, arrived in Fairfax the 15th of March and will be ready for April and May trade. He says: "They consist of 3 to 5 year olds of all the popular colors. My barns are full of stallions at the present time, all of the best quality and in the pink of condition. Several Mammoth roans weighing from 2250 to 2400 lbs. I have no matured stallions weighing less than a ton and a barn full of the coming 3 year olds weigh from 1800 to 2000 lbs. at present. I also keep a few choice Percherons, but men wanting Belgians are always delighted at the Belgian horse show to which they are treated when here. Supply never allowed to run low. Illustrated catalog free."

A. Madsen & Sons of Atwood, Kas., are advertising a fine residence and two lots to trade for stallions and jacks. Their ad is in this issue.

Olson Bros., Assaria, Kas., have a good grade stallion advertised for sale or trade in this issue.

See the ad in this issue of Dr. P. L. Benthack, Platte Center, Neb. He is disposing of his Percheron stallions and mares on account of making a change in business.

Alex. Galbraith & Son, De Kalb, Ill., write: "We have recently added to our stock some Clydesdales, Shires, Suffolks, Percherons and Hackneys, all of the very best quality and several of them prominent prize winners. We are offering these horses as well as our regular stock at very attractive prices and on easy terms."

A letter from A. Latimer Wilson of Creston, Ia., says his last importation of stallions this season left Europe on the 6th of March and were due in his barns at Creston, Ia., the 20th of March.

George B. Robinson of Danville, Ky., recently sold to Messrs. Joe Irvine and W. T. Robinson what is considered one of the finest yearling jacks ever raised in Central Kentucky, according to a local paper. Jack dealers who have seen this animal predict for him a great future. The price, not to be made public, was told to a reporter for the Messenger, and is probably the highest paid for a yearling in many years. Mr. Irvine said he was the highest priced animal this firm has ever purchased. Mr. Robinson has been quite successful in raising jack stock, and has today as fine a lot of stock as can be found anywhere.

J. K. McLaughlin of Carter, Ill., writes as follows of the stock he is closing out: "The breeding stock are high class and top notch breeders. They will go to the highest bidder—no by-bidding."

James Spear of Stanwood, Iowa, writes as follows about the three Clydesdale stallions he is advertising for sale: "These colts are sired by Prince Henry 11329, a prize winner at International. Grand dam and imported mare are extra heavy bone, and fine individuals."

Stannard's Processed Crude Oil, advertised in this paper, is a standard dip with many breeders and feeders because it have given universal satisfaction. Here is an endorsement given it by N. H. Gentry, Sedalia, Mo., one of the best known breeders in the United States: "Mr. C. A. Stannard, Emporia, Kas. My Dear Sir: It is a pleasure to me to testify to the worth of your processed oil as a lice killer. It certainly does the work better than anything I have ever tried. It is the only preparation that kills both lice and nits at a single application. It certainly does so most thoroughly.—N. H. Gentry, Sedalia, Mo." It is time now to secure your dip this spring. Write Mr. Stannard as per his ad, and mention the American Breeder.

Truman's Pioneer Stud Farm, Bushnell, Ill., writes: "Advices received from our Mr. J. H. Truman state that he shipped our regular March importation on the Minnewaska, sailing from London March 6. This shipment will be exclusively Shire and Percheron stallions Our trade was never better and the demand still continues very strong for high class stallions."

B. M. Boyer & Sons of Farmington, Iowa, write: "We purhcased two pure bred Shire mares six years ago. One has foaled five filly colts and the other one has foaled four and her oldest filly has foaled two fillies; not a stallion colt in the bunch and have only lost one, which died of pneumonia when only a month old; have the others all on the farm, seven of which are sired by the stallion we are offering for sale. This stallion has made half a team on the farm ever since he was 2 years old and will work any place. A 10 year old boy can work him. He never gets boisterous and noisy when in harness, and sires the big rugged class of colts that are in demand. Would not part with him at all, were it not for his fillies that now must be bred.

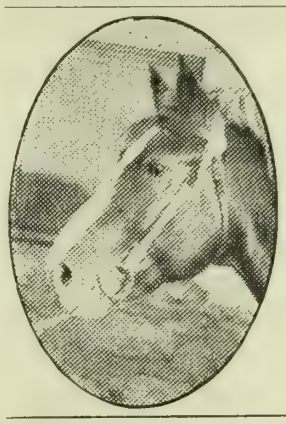
A good dependable liniment for any troubles that may be laying up your horse is Absorbine, the antiseptic liniment. This liniment has been on the market for a good many years and has made good. One reason for its great success is that it does not blister

Percherons and Royal Belgians

We have decided to offer all of our state fair prize winners—22 stallions and mares—for sale. Every one of these horses have been shown and has been a prize winner at the shows of 1912. These stallions and mares will be sold at exceedingly low prices, quality considered.

We are showing some other good stallions and mares, which we offer at prices that defy competition.

We earnestly request you to look over our stallions and mares before buying.



True photos from life on application.

Address,

Four Royal Belgians imported by us in 1912.

WOLF BROS., Importers and Breeders. Boone County, ALBION, NEB.

Belgian Emporium of America

Largest and best collection of Belgians to be found anywhere in America; 150 head stallions and mares, either imported or bred by me. All colors; ages one to five years.

In order to accommodate Belgian customers wanting a Percheron, I have imported a car load of young black and gray Percherons of best quality. Illustrated catalogue free. Fairfax is 3 miles from Cedar Rapids, Ia., on C. & N. W. and on C. M. & St. Paul. Cedar Rapids and Iowa City Interurban passes 1 miles from farms. If coming on it, phone for auto to meet you at Lefebure Crossing.

IMPORTED STALLIONS.

BELGIANS AND PERCHERONS.

Have just arrived from Belgium and France with new importation of Belgian and Percheron stallions which I would like for you to inspect before buying elsewhere. Barn in town. C. W. Babcock, Walford, Benton County, Ia.

Walford is 4 miles southwest of Fairfax on C. M. & St. P. R. R.

LIVE STOCK PICTURES.

I make the best class of live stock photographs—suitable for making cuts or for framing. Drawings or paintings, if desired, but no cheap work. The leading live stock and farm papers of the country use my pictures. **H. L. Ritchie, Mt. Washington, Mo.**

BAD DEBTS COLLECTED.
Stallion Notes a Specialty.
E. R. Smith, Lawyer, Fairfield, Iowa.

or remove the hair and horse can be used during treatment. Get your horse ready for the spring work by removing any blemishes that may be present. Mr. Geo. Lee, of Sherrard, Ill., writes under date of December 26, 1912: "I had a horse about two years ago that had a bunch on his hind leg caused from a neglected wire cut, but I took it off slick and clean with Absorbine and a bandage and sold him for $200, which I thought was fine." Absorbine at dealers, $2 a bottle, or sent direct, charges prepaid upon receipt of price. W. F. Young, P.D.F. 388 Temple st., Springfield, Mass.

J. H. Smith, the proprietor of the Kingfisher Valley stock farm, Kingfisher, Okla., has a dandy bunch of big black jacks and jennets with white points, big body, bone, foot, head and ear, with lots of style. They are the sort that sire the high class sugar mule that always brings money. They are the sort that pay the owner and the patrons wherever they are kept. Mr. Smith says he has spared no expense or pains to have the best. His stock is all registered and a certificate goes with each animal.

Mr. George Tansley has sold to Trumans' Pioneer Stud Farm, Bushnell, Ill., his 5-year-old iron gray stallion Thunderer Boy, No. 29956 in stud book. This horse bred by the seller has proved himself an excellent sire, having some twenty-five colts and fillies now on the farm. His sire is that well known horse College Thumper (25087) sold to the Hungarian government for a long price, and his dam is Cheerly, by Royal Lincoln (6343). Thunderer Boy has the old Thumper blood, from which horse the stud book has so many distinguished winners recorded. He has excellent conformation, stands erect on the best of feet and joints, 17 hands, with grand movement. Mr. Joel Wilson also sold his beautiful mare Strawberry Queen for show purposes to the same firm. She ,too, is by College Thumper, and is correct in movement, and having the best legs and feet possible. This mare has very peculiar yet attractive markings, and will be hard to beat in the show ring. The manager, Mr. J. G. Truman, of the Pioneer Stud Farm, was very eager to buy when over here last summer, but Mr. Tansley would not sell then.—The Isle of Ely & Wisbech (England) Advertiser, Wednesday, February 12, 1913.

The American Farm Gate Company, Elmwood avenue, Kansas City, Mo., writes: "Even though the American Farm Gate Company is but a year and a half old we are receiving many repeat orders, and as a sample of what first purchasers of our gates think of them, we are today in receipt of a letter from Mr. Kearney, superintendent of the Medina Townsite Company of San Antonio, Tex., which reads as follows: 'Please ship by first freight with sight draft attached two more of your 12' Self-lifting style C gates, as our last order—also one galvanized 4x4 style Q fancy top walk gate. Please thank Mr. Campbell for selling me my first gates while in Dallas last year, as I would not have any other kind on my place now. Send gates to Lytle, Texas.—S. W. Kearney.'"

The Automatic Jack Company of Bloomfield, Ind., have an ad in this issue for agents to sell their Automatic Jack combination 12 tools in one. These tools are used by auto owners, teamsters, liveries, farmers, etc., and should be a ready seller. Read their ad.

If you have a good jack weighing 1,000 pounds or over, write to "Lock Box 14," Adair, Iowa. Ad appears in this issue.

Three Percheron mares and two stallions are advertised for sale in this issue by T. H. Terry, Bavaria, Kas.

Chas. R. Kirk, of the Percheron Importing Company, of South St. Joseph, Mo., writes: "We believe we have more dappled grays in our present shipment than any importer in the country. They are certainly handsome horses, great actors, and fit to head the herds of the most careful breeders. The demand is better than last year and the trade entirely satisfactory."

The "No Sag" farm gate offers a new idea in gate building. Read the advertisement in this issue and address the manager of the company, A. V. Rowe, 616 Adams St., Galesburg, Ill.

Notice the article in this issue on the farm use of automobiles written by R. M Owen, president of the company which manufactures the Reo automobile, advertised regularly in this paper.

H. P. Wilkinson Bros., of Mitchellville, Ia., invites inspection of his Shires and Percherons.

Write to Junkens & O'Neil, Danville, Ill., if you are in market for Percherons, Belgians or Shires. They have a fine lot of stallions on hand at all times.

Anyone wanting a Morgan horse should write to Richard Sellman, Rochelle, Tex. He has some of the best that grow.

H. A. Greenwell of Lakenan, Mo., has a fine collection of saddlers—many of them of the famous Rex McDonald breeding. Anyone interested should not fail to write him for prices and description.

Geo. T. Poage & Son of Garrison, Mo., is offering out of season price on 14 jacks and jennets. Write him for prices and description.

Write today for prices on the jacks and jennets that U. G. Saunders, Flemingsburg, Ky., has for sale.

Kentucky Jack Farm, Joe E. Wright, Junction City, Ky., will sell Mammoth jacks in carload lots for the next thirty days at special low prices.

Corson Bros. of Potter, Kas., have 40 jacks and jennets for sale. Write for prices.

Read the advertisement in this issue of Floyd R. Reed, Hull, Ill. He has breeding stock for sale.

D. B. Gunn of Red Oak, Ia., will send his 2-horse Guider Road Builder to any of our readers on fifteen days' trial.

E. R. Smith of Fairfield, Ia., makes a specialty of collecting stallion notes.

Three jacks are offered for sale by W. W. Downing, Hawk Point, Mo.

J. H. Smith, Kingfisher, Okla., has fifty registered jacks and jennets for sale.

Bradley Bros. of Warrensburg, Mo., have seventy-five jacks and jennets for sale. They guarantee every one to be as represented.

F. M. Lorimer of Olathe, Kas., is advertising four trotting stallions, a heavy draft stallion and a jack in this issue.

There are a lot of good arguments in favor of clipping horses at this season, but as most of them are already familiar to our readers, we simply call attention to the advertisement of the leading company in the manufacture of horse clipping machinery, the Chicago Flexible Shaft Co. When addressing this advertiser always mention the American Breeder.

A good many buyers of farm fence like to get a shipment of ornamental fence for their yards along with their field fencing. You can get this fence of the Up-to-Date Mfg. Co., 990 10th St., Terre Haute, Ind.

D. B. Gunn of Red Oak, Iowa, has made some improvements in what is already the best two-horse road grading machine made. Not only that, but it is one of the most economical machines to buy and operate. Any man who has much barnyard cleaning to do can afford to keep this machine on his farm, and when it comes to road building it is without an equal where two horses are used. Mr. Gunn has been a regular advertiser in the American Breeder almost since the paper was started, and we do not hesitate to recommend him.

One of the most interesting letters connected with any of our advertisers was received recently from H. L. Goodwin, manufacturer of the American Farm Gate. He tells of reeciving an inquiry for gates from one of our subscribers in Great Britain. In the same letter he spoke of a second large order received from the Madero Ranch in Old Mexico. Mr. Goodwin also sells large orders of gates to the railroad companies for use in right of way fencing, for which service no gate has yet been found as good as the American Farm Gate.

F. T. Wallace, Assumption, Ill., has three Percheron stallions advertised for sale at farmers' prices in this issue.

C. B. Dannen, Melbourne, Ia., is advertising his Percheron stallion for sale at a bargain. Read the ad in this issue.

If you are in the market for a Spanish jack, read the advertisement in this issue of John M. Mischke, Crofton, Nebraska.

A. B. Like of Blue Earth, Minn., is advertising two Percheron stallions for sale or exchange in this issue. Look up the ad.

A "tail holder" for use in breeding mares is advertised in this issue by E. E. Hall, Kincaid, Kas. He sells on a guarantee, and asks no man to take chances. A cut in the ad shows how the tail holder works.

Anyone in the market for a Morgan stallion should write to G. W. Miller, Wellsville, Kas. His ad appears in this issue.

Frank L. Stream of Creston, Ia., would be glad to have any of our readers write him about his imported and home bred stallions.

J. B. Reed of Oxford, Neb., is advertising alfalfa seed for sale in this issue.

RAISING MORGANS IN TEXAS.

To the American Breeder: I am and have been a breeder of Morgan horses for 27 years, and will give you my method of breeding and handling them. "The Admiral" (at the head of my stud of Morgans for the past five years) has been bred to 75 mares per year and foaled 50 to 60 mares each year. During breeding season, I have five pastures for my horses; in one I put the foaling bunch and the bunch that is ready for breeding in another. I still have three pastures, number one, two and three. The breeding bunch is brought in to the corrals twice a week, Monday and Thursday, and all mares that will take, cut out and kept until bred. The mares bred the first week are put in pasture one; the second week in pasture two, and the third week in pasture three. At the beginning of the fourth week the mares in pasture one will have been bred from 14 to 21 days and I put them back in the breeding bunch and begin putting in pasture one again and continue this round through the season. When the mares are brought to the corral—generally 25 to 50 bred at a time—the stallion is turned loose with them, with a 20-ft. rope tied to his bridle and as soon as he has found a mare he is tied up and the mare cut out, when he is turned loose again. This is kept up until all mares that want the horse are out, when the bunch is taken back to the pasture and the stallion allowed to serve one. My mares are all halter broken, but the mares are never caught for breeding; just put the mare in a small corral, let the stallion in and he does the rest. In the afternoon he is bred to another mare, but never breed to more than two mares a day, it matters not how many are waiting. I raise about 60 head of registered Morgan colts per year, and in January I wean and number them and have each one halter broken. After this they are fed four pounds of oats per day and graze on the native grass. When the grass starts in the spring, they are turned to the big pasture where they run until three years old without ever being in a stable or eating anything but the native grass, except the oats they eat during and after weaning.—Richard Sellman.

BETTER EDUCATOR THAN ALL THE REST.

To the American Breeder: I take three horse papers besides the American Breeder and it has them all skinned. All the fault I find with it is, it don't come every week, but even at that it has more news and is a better educator than all the rest of my horse papers put toether. I have been in the breeding busines for ten years; I keep three stallions, two Percherons and one Standard bred. I have been very successful in the business; I have tried to study every issue of the American Breeder and its teachings have made me several hundred dollars in the last five years. I don't think any man can afford to be without the paper if he is the possessor of a stallion or of mares only.—J. E. Tobias, Putnam County, Ohio.

R. L. HARRIMAN, Bunceton, Mo.

The Fine Horse and Jack Auctioneer of the West.

I sell more horses and jacks than all others. Terms always right: work always up to the highest standard.

SADDLE STALLION

For sale. Jim Patterson 4000; bay; 15¾ hands; weight 1050; sire Chestermede 1676, by Chesterdare No. 10; dam Sallie F. 2865, by Quarry Denmark 1337. Priced right to sell. **Craig Bros., Pittsville, Johnson County, Mo.**

ROADSTER AND HEAVY STALLIONS AND JACK FOR SALE.

Four extra well bred and registered trotting stallions. This is no trading stock, but good, clean young stock, raised on our 800 acre stock farm. For sale cheap.

One 5 year old heavy horse, "Sure Shot," with plenty of colts to show that he is a good breeder. Will sell cheap if taken right away.

One black matured jack, for sale if taken before season opens. **F. M. Lorimer, Olathe, Kas.**

SADDLE STALLION AND JACKS FOR SALE.

Double Chief 3544, dark bay, 15¾ 5 years old, half Chief, half Denmark, popular blood lines. One herd jack, black, with white points, 5 years old, 15¾ standard, with size, substance and finish. Also 2 coming 3-year-old black jacks, white points, 15¼ and 15½, well broke. Some of the most popular registered saddle stock. Different ages at all seasons of the year. Address, **Geo. B. Robinson, 301 E. Main St., Danville, Ky.**

SADDLERS.

40 saddle stallions, mares, colts and fillies of the best Denmark and Chief breeding. Special prices on stallions for the next 30 days. **J. F. Cook, Lexington. Ky.**

MORGAN STALLION

for sale; blood bay; four years old; 16¼ hands high; weighs 1,350 pounds; son of Captain Morgan. Eligible to register. **G. W. Miller, Wellsville, Franklin County, Kansas.**

EXCELSIOR SHETLAND PONY FARM.

Registered stock a specialty; a limited number for sale. W. H. Fulcomer, Prop., Belleville, Republic Co., Kas.

SADDLERS FOR SALE.

Thirty head of high class stallions at very low prices for next 30 days. Also services of Foss McDonald, Eastern Cloud and others. **H. A. Greenwell, Lakenan, Monroe County, Mo.**

REGISTERED MORGAN HORSES.

My Morgans are large; 15 to 16 16 hands and 1,050 to 1,300 pounds; have clean, heavy bone and possess all of the style and endurance for which the breed is noted. Weanlings to 3 years old for sale by The Admiral 4871 A. M. R., he by Jubilee De Jarnett. Richard Sellman, Rochelle, McCulloch County, Texas.

SUGGESTIONS FOR STALLION ASSESSMENT.

To the American Breeder: In answer to Kansas Subscriber, will say that I am not a stallion owner, but if I were, under the conditions he describes, I would not refund the service fee. When C. bred his mare to B's horse he accepted the terms on which B stood his horse and thereby made a contract, or at least it would be equal to a contract, I think.

While I am about it I have another thing on my mind, and it is the taxing of stallions. I believe a stallion should be assessed in proportion to the service fee charged. For instance, take the service fee for one per cent of the value. (Or less if that is too high). At that rate a horse that stood at $20 would be valued at $2,000 and the scrub that stood at $10 would be valued at $1,000. In that way the scrub would at least pay his share of the taxes.—I. M. Guinty, Butler County, Kas.

The Kansas City Veterinary College

Gives a Thorough and Complete Course. Conforms to the requirements of the Bureau of Animal Industry.

New Buildings, Comodious Hospital, Complete Equipment, Experienced Instructors, Large Attendance, One Acre and a Half of Floor Space.

Many Opportunities as Practitioners, Sanitary Officers, Teachers, U. S. Inspectors, Investigators and Veterinarians. Catalogue and other information sent on request.

Dr. S. Stewart, Secretary,

1336A East Fifteenth Street, Kansas City, Mo.

MISCELLANEOUS.

FOR SALE OR EXCHANGE.

For land or standard bred mares, one black Percheron; 5 years old; sound; registered P. S. A.; stood one season; kind and well broken; sure and good breeder; weight 1,850 pounds. One black Percheron 15/16; four years; sound; 1,800 pounds.

These colts are right in every way but on account of sickness I must dispose of them at once, regardless of price. **A. B. Like, Blue Earth, Faribault County, Minn.**

POSITION WANTED BY GRADUATE.

I have attended the Graham Scientific Breeding School two terms and used modern methods last year successfully. Can show a large per cent of capsule colts. I have sold my breeding establishment and will accept a position with a reliable firm for this season at reasonable wages. **Henry Dreher, Cedar Rapids, Neb.**

SMALL BREEDER WANTS TO SELL

2 gray Percheron stallions, 3 and 5 years old; 1 imported; 1 home-bred; 1 black coming two; 1 Wilkes Standard Bred, registered road horse; 1 gray mare in foal, imported; 2 Shetland stallions, coming 2. **C. F. Hoaglin, Hillsboro, Henry County, Iowa.**

FINE 1½-STORY RESIDENCE

And two lots in Atwood, Kas., to trade for stallions and jacks. **A. Madsen & Sons, Atwood, Rawlins County, Kas.**

WANTED.

Reliable man to work on farm. Must be capable of handling stallion. Good wages to right party. Address, **Albert Dykins, Ramona, Lake County, South Dakota.**

WANTED, HORSEMAN.

One with experience, to take care of two draft stallions during the season. Four months' work. State wages. Give reference.

A. J. Hatteberg, Paxton, Ill., R. 4.

HEALTH OF THE JACK.

A jack requires very little attention in the hands of an experienced jack man. A reasonable sized yard, the larger the better, fenced jack tight, with a barn on the north side so that the jack may run in an out at his leisure, is the best quarters for an animal of this kind. No breeding or teasing should be done in this enclosure. A fence 20 feet back from the original jack fence should be maintained to keep other stock from annoying the jack. When a service is to be made a breeding pen a reasonable distance from the jack barn should be erected.

A jack is a very clean animal if he has an opportunity. There is perhaps no other class of live stock which keep the barn as free from excrement and gasses from the floor. This is one reason that a jack should be maintained in this manner. The condition of the barn is responsible, in a great measure, for many jack sores. If a jack is allowed his freedom so that he can go in and out at his leisure, his general condition is much better.

We have found it to be a good plan to have a few limbs of trees so that a few branches could be put in the jack's corral where he could skin the bark off. This is not injurious and offers some entertainment, and the jack's system requires a little change from the regular routine of feed. A few carrots are an advantage in the feed. These should not be fed too freely to begin with, but can be increased in order to keep the bowels in good condition. Always remember that a good feeder watches the bowels closely. If an animal is constipated, a more laxative diet should be favored. There is no better feed than oats and bran, equal parts by measurement, when prairie hay is used. If clover or alfalfa are made a portion of the ration, less bran should be fed. Corn has little value as jack feed; it is usually too heating unless a jack is one of those which will take much exercise. The average jack does not get sufficient exercise. Some breeders have employed the use of a tread power with good success. There is usually this difficulty in a tread power, a jack may not wish to enter the first time. A good method of inducing him to the initiation is to tie him in such a position that he can walk in; put a little feed in a feed box in the front end of it. After he has surveyed the general surroundings a reasonable length of time, he will frequently walk in. This exercise should be limited the first day, and he should be tied securely, for it might not meet his liking, which would result in an effort to escape.

No radical change should be made in the feed or management of any breeding stock, which, of course, includes jacks. Good jacks are very profitable and should receive the very best of care. Just because jacks will live on most anything is no reason that they should be maintained in that manner. The better care and handling a jack receives, the better service he will be able to deliver.

Jacks are of a sluggish nature and require a little more fresh air, sunshine and freedom than the average horse. If they are properly handled there is little danger of them having sores or rheumatism. Jacks are subject to rheumatism a little more so than horses. There seems to be a condition of jack rheumatism which may be called a light attack of lamanitis. If the general health of the animal is good, and they are accustomed to plenty of fresh air, they will not take cold so easily. One of the best investments for jacks is to dig up a nice soft dirt bed where they can roll at their leisure. All clods should be broken and kept soft so as not to injure the animal. Jacks certainly enjoy soft dirt.

JACK SALE AVERAGED $615.

Messrs. Hineman and Hutchins report a sucessful sale of jacks and jennets at Sterling, Kas., on February 25. The sale average $615 per head with a top of $1,180, this price being paid for the two year old jack, Sampson. The grandsire of Sampson was an imported Poitou jack. The buyer was B. L. Turner of Frederick, Kas. Oklahoma, Kansas and Colorado bought all the jacks. Messrs. Hutchins and Hineman have decided to make this sale a regular annual event, and have selected the last Tuesday in February for the day.

MULES, JACKS AND JENNETS.

100 WEANLING MULES

ror sale. Three years old; 15½ hands standard; guaranteed sound and a foal getter; quick performer on mares. Can be bought right. **J. T. Richardson, Guilford, Nodaway County, Mo.**

40 HEAD

Jacks and jennets. Write us for prices. CORSON BROS., POTTER ATCHISON COUNTY, KANSAS.

CARE OF THE MANURE SPREADER.

To the American Breeder: Nothing in the operation of any machine is as important as the lubrication; and the manure spreader is no exception to this rule. It should be oiled frequently. When you first start using a new spreader, you should go over it very carefully, oiling all moving parts. Then watch the machine closely for a while, and you will soon learn what parts must be oiled several times in a day's work. Give the machine the right kind of a start, and it will save dollars for you in needless repair bills. Get into the habit of oiling it regularly as needed. Don't think that it does not need oil when it is covered with manure. It may not be a nice job at times, but it pays in the end.

When the machine is not being used every day, it should be cleaned and oiled before putting it away in the shed. Rust and decay take more life from the machine than the actual work it does. This is proven by the many breakdowns that occur with the first load hauled after the spreader has been idle for five or six months.

Keep the beater clean. A clogged beater adds greatly to the draft of the machine. Let the horse walk at a brisk rate when spreading. This makes the beater clear itself better and the work is done much better all around. When you get back from the field, if you find the beater teeth holding bunches of manure, knock them off before going out again. You will notice a big difference in the spreading and draft.

Manure spreaders having slat conveyors for bottoms, should in cold weather be examined very carefully before loading to maks sure the conveyor is not frozen solid. It is best to work the feed by hand in making this examination. Keep all nuts and screws tight. Load your spreader according to the instructions sent with it.

You must govern the feed by the kind of material you spread, and by the size of the load you haul. The beater makes a certain number of revolutions to each revolution of the rear wheels. If you load high, it means there is a greater volume of material to be pulverized and thrown out each revolution of beater. Watch the work of your machine, and if at any time the feed seems too heavy, and the beater cannot take care of it, throw the feed lever back a few notches to give the beater a chance to clear itself. Watch your machine and avoid trouble.

If you have used your manure spreader for several years and it has always given you entire satisfaction, don't curse the spreader and the manufacturer when it causes you trouble, but examine the spreader carefully—go over every part trying to locate the cause of trouble. If it works O. K. when you first used it there is a reason for the trouble. Dig up your instruction book and read it and you will find your trouble. If you do not succeed in locating and remedying the trouble. write to the company that manufactured the spreader, giving them the trouble in detail, and they will supply you with necessary instructions.—William Galloway, Blackhawk County, Iowa.

SALT FOR BREEDING STOCK.

Plenty of salt at all times is necessary in horse breeding. The natural saline solution in the body of an animal is composed of about a level teaspoonful of salt to a pint of water. It is not necessary to give an animal this much salt for the given amount of water, but each animal should be his own judge as to the amount of salt taken. Every animal should have a box where salt can be obtained at its pleasure. Then there will not be any danger of getting too much salt at any one time.

This is necessary with all horses, jacks and jennets, and especially necessary with jennets. A jennet can and frequently does eat enough salt at one time to cause an abortion when salt has been withheld for several weeks.

MUMMIFIED FETUS.

A reader asks if it is possible for a mare to carry a dead colt for several years.

An unusual condition met with in breeding females is the presence of a mummified fetus either within or outside of the uterine cavity. They have been found in all stages of development. They undergo mummification as a result of death from accident or disarrangement of proper blood supply resulting in slow death from nutrition being shut off. Not being exposed to the action of putrefying organisms they naturally dry up; the fluids of the body being gradually absorbed into the system of the dam. Such absorption sometimes deranges the health of the mother on account of the poisonous effects of the fluids from the dead fetus, resulting in debility, loss of flesh and sometimes death.

A mare carrying a mummified fetus may receive the embrace of a stallion and even conceive, according to the best authorities, at least it is no very rare thing for a mare to deliver a fetus of this character and a living foal at the same time.

Whenever a pregnant mare begins prematurely to secrete milk it affords grounds for one to suspect that the life of the fetus is in jeopardy, and if abortion does not take place mummification may be the sequel.

A YEARLING MISSOURI JACK.

To the American Breeder:—I will give a short description of my 20-months-old jack: He is black with white points; 60 inches high; 65-inch heart girth and flank measure; bone, small part of front leg, 7¾ inches around; ears 3¾ inches from tip to tip, with all the style a jack can have. I don't know his weight, but he is heavy enough for his height.—C. B. Carpenter, Hickory County, Mo.

IS THIS THE BEST?

To the American Breeder:—We think this the best jack yet. Here are the measurements: Black with light points; 16 hands standard; weight 1,155; 21-inch arm; 17-inch knee; 10-inch below knee; 20-inch hock; 10½ inches below hock; 12-inch heart; 72-inch flank; 35-inch ears; three years old.—John H. Bright, Lawrence County, Ind.

AND COLORADO, TOO.

To the American Breeder:—I see a number are telling about the big jack colts. I have one 18 months old that has 7½-inch cannon bone; 30-inch ears; heart girth 52 inches; 13.1 hands high and he has never seen any oats. —Bert Sell, Yuma County, Colo.

"PLACE AN AD. AND BE CONVINCED."

To the American Breeder: I am very much pleased with the ad you printed for me. Through it I learned of more good stock; the right kind at the right price. I also received letters from buyers in seven different states and found the right man who took two jacks and saddle stallions at a long price. They went to Mr. W. T. Trotter, Mt. Ayr, Iowa. The American Breeder wil get the buyer. Anyone who wants to prove it can place an ad and be convinced. It has proved good to me. He who tries can win a prize that money cannot buy.—Isaac C. Lohman, Clinton County, Mo.

JACKS AND JENNETS.

Forty head of Mammoth jacks and jennets for sale. Jacks in age from colts to four years old; in size up to 16 hands. These jacks are all good ones; in this lot are two as good as grows—good enough to head any herd of jennets. I have one of the best herds of jennets in Kentucky. I raise all my own stock and will sell them worth the money. Write for prices today, or better, come and see them. **U. G. Saunders, Flemingsburg, Ky.**

FOUR JACKS FOR SALE.

One jack, black with white points; 16 hands standard; foaled June 16, 1908, register No. 3081. Brown jack 15 hands, extra heavy bone and body; good head and ear; foaled September 4, 1909. Black jack with white points; 15.3 hands; foaled 1903; extra breeder. A good, quick server with jennet. Extra good jack colt foaled June 12, 1912; height 54 inches; extra good head and ear, with plenty of bone and body. Sire register No. 3081; dam register No. 1603. This will make an extra good jack. **W. W. Downing, Hawk Point, Lincoln County, Mo.**

Headquarters for

Mo., Ky., and Tenn. Jacks

Sold singly or in carload lots. I guarantee more bone and more good Jacks and jennets than any breeder or dealer in Missouri. Every one black and from 15 to 16 hands high. Have them of all ages. Thirty-five years doing business with the public, and never had a lawsuit with a customer.

ED. BOEN, LAWSON, MO.

(Lawson is 28 miles from Kansas City.)

JACKS AND MULES

We have 14 jacks from one to six years old; have lots of bone, size and quality; all black with white points.

Also have 128 yearling mules, coming two year old, and 26 mule colts. These mules are from grade draft mares; have lots of bone and width. Only 15 out of the 154 are horse mules, the balance are mare mules. Will sell at reasonable prices. **Scott, Abney & Jenkins, Virden, Macoupin County, Ill.**

20 JACKS.

Coming one to seven years; the big, rugged kind. Can sell you tried jacks, show jacks or herd headers worth the money. Everything guaranteed as represented. **H. T. Hineman, Dighton, Kas.**

Lake View Stock Farm

For sale, 15 jacks as good as any one has, from six months to five years old and from 14 to 16 hands high. I can sell them for less than any one. Write for particulars or come and see them. **T. H. Early, Centralia, Boone County, Mo.**

JACKS.

20 good black jacks and some good jennets; coming 3 to coming 8 years old. Large, heavy boned, broken to mares and prompt servers. Prices reasonable. Come and see me. Barns 2 miles from town.

Phil Walker, Moline, Elk County, Kas.

EXTRA GOOD HERD JACK

for sale; seven years old; weighs 1125 pounds; serves well on mares and jennets. Also two year old jacks and jennets as large as they grow anywhere. I guarantee them to be right. Come and see them. **Henry Obermann, Freistatt, Lawrence County, Mo.**

EIGHT JACKS FOR SALE.

Combining the blood of Autar, Black Giant and Lime Stone Wonder; all black, white points.

Have either a trotting or a coach stallion for sale or will trade for a good Percheron mare or jennets. Must be a good one. These horses are sound and the very best of breeders, but have one too many. **Chas. Wyatt, Petersburg, Pike County, Ind.**

CARBOLIZED VASELINE IS GOOD FOR SCRATCHES.

To the American Breeder:—Scratches, also called cracked heels or mud-fever, can be prevented by careful stable management. Cases are rarely met with in well kept barns, but are often seen in dirty, poorly drained stables. Dryness and cleanliness of the floor of the stall are the two most important factors in the prevention of scratches.

Horses should not be allowed to stand in piles of manure and decomposed urine. These irritate and inflame the thin skin in the fold of the ankle, just below the fet-lock. The skin then becomes thickened, due to the inflammation, and breaks or cracks in it appear and if allowed to go untreated, the condition grows gradually worse. The affected area grows larger, the cracks become deeper, and the animal is in an unsightly and painful condition.

Owners of horses can prevent the trouble, in the majority of cases, by doing two things. Do not allow manure to accumulate behind your horses, and see that your stalls are so constructed that the urine will drain away promptly. If your horses show any tendency toward the condition, apply a small amount of carbolized vaseline, benzoinated lard, or zinc oxide ointment, well rubbed into the affected parts. These remedies will soften the skin and protect it from external moisture and irritating substances. During wet weather, or when the roads and streets are muddy or slushy, extra precautions should be taken to prevent the condition. Do not wash cracked heels, as water and rubbing only aggravate the condition. —Dr. H. Preston Hoskins, University Farm, Minnesota.

TREATMENT FOR AN "ITCHY" JACK.

To the American Breeder: Here is a remedy for a jack that is losing his hair and is itchy. Take one quart of water, one-half pint salt, one tablespoonful of carbolic acid, two tablespoonfuls of sulphur, the same amount of air slacked lime if you have it. Use it as hot as you can without injury to the animal once a week for about three weeks. If you do this right it will make you smile. Use it on a warm day.—J. I. Woolridge, Effingham County, Ill.

ONE AD; 25 REPLIES.

To the Amircan Breeder: I am well pleased with the results of the ad I had in your paper. Although I had you put it in only one issue, I received about twenty-five letters from prospective buyers. I think the American Breeder is just "It" for advertising purposes and am well pleased with your paper otherwise.—G. Casper, Nobles County, Minn.

SON OF A HIGH PRICED ONE.

To the American Breeder: I see in your issue of February 20 that there are two big jacks. Now I have one that is not quite as good in some points but better in others. My jack was foaled in September, 1910. Ears 33 inches; knee 16 inches; below knee 10 inches; hock 19 inches; heart girth 70 inches; flank 72 inches; arm 19 inches; black with white points. This jack was sired by a Tennessee jack that sold under the hammer for $3,300.—Geo. Cochran, Leavenworth County, Kas.

A BIG ONE AT OWL HOLLOW.

To the American Breeder: Seeing the account in your last issue of Mr. I. L. Crocket of Clay County, Ark., also of Mr. Dillingham and Mr. Dewitt of Jackson County, Mo., here is another big Missouri boy: Age 3, stands 16 hands standard; length from center of head to root of tail 7 feet 9 inches; girth at heart 65 inches; flank girth 67 inches; head 30 inches; muzzle 27 inches; ears 32 inches; arm 18 inches; knee 16 inches; below knee 10 inches; above hock 16 inches; below hock 10 inches. I don't know what takes best in other localities, but the more bone size and quality you can get in a jack, the more he is appreciated in this neck of the woods. This jack heads our herd; his name is Big Ike. I was offered $500 for him when a suckling colt, by Ed Joy of Garden City, Mo.—W. W. Shott & Son, Clinton County, Missouri.

A BIG ONE, FROM "DRUM STICK" TO UPPER LIP.

To the American Breeder:—I saw in the American Breeder from D. A. Sprague of Ohio, in the January issue, and J. T. Pylon of Tennessee, in the February issue, about their big jacks. We raise them in good old Missouri. I have a jack four years old, black with light points; ten hands high; weighs 1,100 in common flesh; seven feet long from crown to root of tail; girst 75 inches; flank 79 inches; ears 34 inches; from lip to mane, 32 inches; arm 22 inches; knee 17 inches; drumstick 10½ inches; hock 21 inches; below hock 11 inches. Sired by old Bryan No. 280. If any one can beat that I would be glad to hear from them through the columns of the American Breeder. Yours for big jacks.—F. A. Strong, Webster County, Missouri.

AN OZARK JACK'S MEASUREMENTS.

To the American Breeder:—I noticed in your paper that jack breeders of different states have given the measurements of their big, young jacks and some old ones, and want to hear about others. Here I give the measurement of a jack that is at this writing 28 months and six days old: Height, 15½ hands, standard; length over neck and body, seven feet four inches; heart girth, 67 inches; flank, 70 inches; arm, 22 inches; knee, 16 inches; below knee, 9 inches; hock, 20 inches; below hock, 10 inches. This jack is not fat, but has the finish of a well made mare mule. I believe this is not a bad colt for southwest Missouri.—Henry Oberman, Lawrence County, Missouri.

AN ILLINOIS BIG ONE.

To the American Breeder:—I notice in your valuable paper of February 20 a description of some large young jacks in Ohio and Tennessee. I have one here in southern Illinois that I think is a good one. He is a black mammoth jack with white points. He was two years old last July. He measures 15¾ hands high; head, 32½ inches; ear, 33 inches; girth, 68 inches; flank, 70 inches; arm, 20 inches; knee, 16 inches; cannon, 10¼ inches. I would be glad to hear from others along this line, especially in Illinois.—M. T. Hawthorne, Hamilton County, Ill.

HASTENING THE SLOW JACK.

To the American Breeder:—I see in the American Breeder of February 5, that it requests the readers of this valuable paper to give their experience with slow jacks. I have had some little experience along this line. My experience has been that where anyone has a slow jack to contend with, it is very unsatisfactory at best. I find that I could always have better success with them to not try to make too many services with them in one day, and never use them for teasing, and never take one to the breeding place until the mare has been teased by a stallion. Then the jack will learn that when he has been taken out that he is expected to serve, and by never allowing him to be disappointed he will learn to get ready and perform his work much quicker. Always have the mare in a good substantial breeding pit so he will learn that he is in no danger of being kicked, as a jack is a very sensible animal and when he gets kicked or hurt in any way it takes him some time to forget it. The jack should always have good and kind treatment; never try to make a service with a slow or spoiled jack on a rainy, cold, windy day. Some slow jacks will be better performers if you keep them where they cannot see any stock only when you desire to make a service with them. A jack should be well fed and have plenty of exercise. I see that some people recommend giving a slow jack some drugs to excite his passion, which I never thought would be of any benefit. I have before now fed them raw eggs from which I thought I got good results, but I have found some jacks which I found it very troublesome to teach them to eat eggs; I would break about two eggs in their feed and mix it well, adding a little salt, which would make it more palatable. As this is about the best way I could find to handle a slow jack—B. H. Hays, White County, Arkansas.

LaFAYETTE STOCK FARM

HIGGINSVILLE, MO.

Mammoth Jacks & Percheron Stallions

20 JACKS—3 to 6 years old; 14.2 to 16 hands high. All black; all broke and guaranteed.

10 PERCHERON STALLIONS—2 to 3 years. Mostly imported. All guaranteed breeders.

Will exchange Stallions for Good Jacks. One German Coach stallion 11 years old. One Belgian stallion 5 years old. Both sound.

20 Jennets in foal to my champion jack, Dr. McCord.

ALL FOR SALE PRIVATELY—NO SALE THIS SPRING. Visit or Write.

W. J. Finley, Higginsville, Mo.

55 Miles East of Kansas City on C. & A. R. R.

SNAP FOR STOCKMEN

$5 to $15 Per Acre.

For Missouri or Oklahoma lands, practically all in native blue stem grass, 50 per cent subject to cultivation, fine running water, two to eight miles from Kansas City Southern Ry., and only 200 miles straight run to Kansas City market.

Cattle and hogs are being raised and laid down on the K. C. market at less cost and greater profit than at any other point in the southwest. Pasturage most all year 'round. Clover, alfalfa, corn ,etc., make good crops. Ample rainfall. Most of land in native timber with fine grass.

BEST HOG COUNTRY IN THE WORLD

Stock hogs come from this section because they are free from disease and it costs practically nothing to raise them.

Fine climate. No bad blizzards or hot winds. Ideal country to enjoy life and make money. This same land put in fruit is netting annually $100 to $150 an acre. Tracts of several hundred acres or more at $5 to $15 per acre. For particulars address **Wm. Nicholson, Immigration Agent,**

KANSAS CITY SOUTHERN RAILWAY, 671 Thayer Bldg., Kansas City, Mo.

IRRIGATED FARM LAND.

With Abundant Water Supply.

Grazing Land (Watered) and Timber for sale in Southeast Colorado. Irrigation facilities here are unexcelled and this has long been Colorado's best live stock section.

Oats yields 30 to 80 bus.; wheat, 20 to 60 bus.; barley 30 to 80 bus.; potatoes 150 bushels and up; beets highest sugar content; alfalfa 4 to 6 tons per year and all grasses do well.

The climate here is exceptionally good.

Mining towns make good markets. Eggs average 30c; butter never less than 30c; oats $1.25 and up, per hundred. For good values in land, or any dred. Gor good values in land, or any reliable information, write

W. L. Morse, Mancos, Montezuma Co., Colorado.

FARMS NEAR KANSAS CITY.

80 acre improved farm in Jackson County, Mo., 25 miles east of Kansas City; on graded road; close to cross state electric line. Price $10,000; $2,500 down, balance long time.

98 acres same distance from Kansas City, 3 miles from railroad town on graded road; price $12,000. Could use some stock as part pay.

D. B. Kirby, Grain Valley, Mo.

SPLENDID RESIDENCE

In Chillicothe, Mo., for sale, or will trade for land or live stock.

Good Black Jennets Preferred.

6 room house and 2 good lots, east front, best part of town, near school house and churches, modern except furnace.

D. B. Kirby, Grain Valley, Mo.

For Sale

a good quarter section of land in Lane County, Kas., all tillable. Worth $2,000, but will take $1,800. Eight miles from Ravanna, 17 miles from Dighton. Address **A. P. Miller, Imperial, Kas.**

Must Sell---Sacrifice

160 Sumner County. Highly improved; close to town; 40 acres alfalfa; 60 pasture; excellent farm. Information LOCK BOX 285, WELLINGTON, KAS.

"REAL ESTATE WANTED."

for sale or trade for pure bred horses; Percherons; mares preferred. Price $20 per acre. **F. D. Maddex, Arcadia, Neb.**

RED RIVER VALLEY LANDS

For sale and exchange. For information write **J. J. W. Dvorak, Wyndmere, North Dakota.**

QUESTIONS AND ANSWERS.

(Continued from page 4.)

put up a claim of this kind, but the law plainly states that the colts can be held, if your claim is recorded in proper form before the colts are born.

KEEPING THE SEMEN—Is it possible to keep the semen alive for three days, shipping it by express in a vacuum bottle, then produce colts from it?—New Mexico Subscriber.

REPLY—It may be possible to keep the semen three days and produce foals, but the chances are that this will be a failure in most cases. The condition in which semen must be kept is not practical with the average breeder. We do not believe that semen can be successfully sent by express in any kind of a receptacle.

MASTURBATION—I have a stallion which I bought last May; he was guaranteed all right in every way. He was masturbating when I got him and is still doing so. He is extra good looking; in good flesh and feels good. When he serves he comes off too soon. What shall I do for him? Don't think he got many colts last year. Bred 40 mares and don't think more than four or five mares are in foal. I wrote to the man I bought him of and he don't seem to think there is anything wrong with him. Never bred more than two mares in one day. What can I use on him? A whang leather would be lots of bother in the season.—Nebraska Subscriber.

REPLY—Do not use this stallion as a teaser; do not permit him to occupy a paddock or enclosure where mares have been bred or teased. Do not allow him to see or smell a mare that is in heat except when he is to be used. Build a corral large enough for him to exercise in so that he cannot go in a barn at night. Force him to rough it for a while. This change must be made gradually, however, by placing him in a stall or shed where there is much fresh air as he might get sick if forced to remain outside without getting accustomed to it by degrees. After an animal has acquired this habit of masturbating, they usually do it about midnight when the barn is comfortable. There is not much danger of them doing it if they are forced to lie outside at night. The whang leather may be troublesome to you but if you expect to get any results in this case you must attend to your business or you will have a ruined horse. The fact that your stallion is in good condition, and that he got a few colts last year, might be evidence that he could be improved with a little attention. A new arrangement will be on the market we understand in the near future that really prevents masturbation without any injury.

DEVELOPING A JACK—I have a jack that will be three years old the 16th day of September, 1913. He is 58¾ inches high, 65 around heart girth and 9½ inches around front leg between knee and ankle; is tall and slim with very deep heart measurement, and good bone. Do you think he will grow much larger and how many mares should I let him serve this season?—Illinois Subscriber.

REPLY—You have a good young jack, much better than the average. It would be safe to make from 12 to 15 services with this jack, with no two services closer than four days each. Be careful with him that he is not spoiled while breaking. Keep all the jennets, mules and jacks away from him; do not allow him to use a paddock where mares have been teased or bred; do not allow him to see or smell a mare that is in heat except when he is to be used. Do not use a bridle too severe so that he will be afraid or timid. Pit your mare good and solid so she cannot hurt him. Get a supply of good oats and plenty of good roughness—anything that he will eat good so as to keep him growing nicely—change a part of the feed occasionally. He should get much larger if you pay attention to his development.

CROSS BREEDING HORSES—Would it be all right to breed a Hambletonian filly to a Belgian horse? She is 15½ hands high and a good driver. She is inclined to be nervous.—Texas Subscriber.

REPLY—It is usually best not to cross-breed horses, but as there are so many light horses in the country, and not enough draft horses, some should be bred to draft horses. The sire in this case should be smooth and well proportioned; having a good, long pedigree. A good, smooth draft stallion crossed on light bred mares, will usually produce a good, serviceable animal.

JACK GETS SLOW—I have a five year old jack that I have stood two seasons. He works fine until the last part of the season when I drop down to two to four mares a week, then I have trouble with him. I have a lot for him to run in and feed him oats, bran and green feed. He is a fine jack and got 55 per cent of colts last year. Please tell me if there is anything I can do for this trouble.—Oklahoma Subscriber.

REPLY—This condition is not extraordinary with jacks. Have your pit in a position so that the jack can

THE RIGHT WAY

IN ALL CASES OF **DISTEMPER, PINKEYE, INFLUENZA, COLDS, ETC.,** of all Horses, Jacks, Mules, Brood Mares, Colts, Stallions, is to

SPOHN THEM

On their tongues or in the feed put Spohn's Liquid Compound. Give the remedy to all of them. It acts on the blood and glands. It routs the disease by expelling the disease germs. Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

N. B.—When we started this ad a year ago the American Breeder required us to deposit $500 with them, to insure the protection of every subscriber who bought **"Jacksorine."** We have sold several hundred boxes, and only 8 buyers failed to work a cure. These got their money back.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in a substantial box and sent promptly by mail. It is a paste and applied with a small brush three times a day.

Send money by bank draft or P. O. money order. Price $5.00.

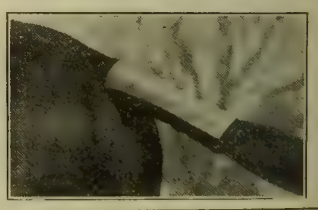
O. P. WILSON & CO., 3754 Wayne Avenue, Kansas City, Mo.

Stannard's Processed Crude Oil

THE BEST DIP MADE

for killing lice and curing mange. One application will do more to kill lice and cure mange than three applications of any other dip made (it destroys the nits). . .....$5.00 for 52 gal. bbl.

I also carry a full line of lubricating oils.



I will pay $1.25 each for my crude oil barrels; $1.50 each for my refined oil barrels, returned to me at Coffeyville, Kas., in good order, less freight charges on same.

C. A. STANNARD, BOX A, EMPORIA, KANSAS.

TAIL HOLDER. (PATENTED.)

Most satisfactory and sanitary way of holding a mare's tail while breeding. These **"Tail Holders"** are a proven success. Every owner will appreciate your fixing his mare in good shape to breed. You haven't time to fool with a filthy string, which is a poor method anyhow. You can put on and take off this **"Holder"** in an instant. Send for one and if it is not as represented return it and get your money back. Price, 50 cents, postpaid, stamps or M. O.

E. E. HALL, Kincaid, Anderson County, Kas.

see the mare. Put him in the pit and give him a little more time when you are expecting this trouble. You have probably made a very large season with him.

RE-SERVING MARES—In the spring of 1912 I bought two large jacks, each weighing over 1,000 pounds, and one imported Percheron stallion, three years old, that weighs 2,000 pounds. This being my first year in the business I would like advice as to what to do with a customer that breeds a mare to my horse the fourth time; then on the 21st day this man drove past my place and bred to another horse, and this mare is safe in foal today. Would it be best to try to collect this or not?—Kansas Subscriber.

REPLY—It is not likely that you will have much trouble of this kind. There are mares that may be bred while pregnant. I would file a lien with the register of deeds before the colt is born, and if this mare delivers a foal that corresponds with the first or second service of your stallion I would collect it. If the colt corresponds with a service of the other man's horse, I would try to see what the difficulty was. It may have been the fault of the mare. Frequently a mare will not fertilize at a particular time, and get with foal at a later service. This is a very common occurrence. What you need is a microscope to test your stallion and jack and see whether they are producing live spermatozoa or not. If they are not you should take better care of your stock; build them up and diminish the number of services. There is very little use to make a service unless you expect results.

SHY JACK—I have a good stallion and a jack. I bought the jack last March; he had been poorly wintered. He was very keen to serve, but would not settle any mares. He was four years old and had been used hard the year before. I bred him to 42 mares and do not think that he has more than 12 or 15 in foal. He is in fine shape this spring. He has a large yard to run in; has had but very little grain; has had alfalfa hay and good silage. He has grown and is looking fine now. He is going to have a big run this spring for he is a good jack and lots of men want to breed to him, but I like to have better results for so much work. How would you advise me to do? Would it be a good thing for me to get a capsule breeding outfit? Could you give me full instructions how to use it, for I have never seen anything of the kind.—Kansas Subscriber.

REPLY—Gradually diminish the alfalfa and cut out the silage entirely; increase the oats and feed a little prairie hay. Make this change with judgment so as not to change the system too rapidly. About one quarter alfalfa should not be objectionable. It may be that your jack has been slightly injured by an excess of services. If he is not too old he should recuperate some in this respect. There is only one way that you can tell whether your jack is a regular producer or not and that is with a microscope, unless you wait a year to see whether the mares bring foals or not. If your jack does not discharge live spermatozoa a capsule will not help you any, but you can greatly improve his producing capacity by limiting the services to one a day. He should produce fertile semen at one service a day, unless he has been seriously injured. We would advise paying close attention to the manner in which he serves mares. If he is a long legged jack or too short, the pit should be adjusted to fit each mare in height so that he can make an average service. If the penis is extra long, do not raise him too high. You will find full instructions for capsule breeding in the March 5th issue. If they are not plain enough for you, write us again.

LOCKINGE HENGIST,
Champion Shire Stallion, International of 1912; Weight, 2,350 Pounds at Four Years; Owned by Trumans' Pioneer Stud Farm.

A CHANGE OF SEMEN—I have an aged mare, perhaps 18 years old, that has been a regular breeder for years. I bought her at a sale two years ago, guaranteed safe in foal. She had a weanling colt by her side at that time, but was not in foal. I have bred her for two years now and she has not gotten in foal yet. I think that she was usually bred to one horse until the spring before I got her, when she was changed. Do you think if I would take her to this other horse again that she would be more likely to get with foal? This mare is very large and seems to be in perfect health.—Illinois Subscriber.

REPLY—Occasionally a change of semen will get results. It might be worth while to try this mare back to the old horse again in a case like this. Mares of this age should not be allowed to skip for it is usually with difficulty that they are fertilized after they have rested a year or two. There is one good plan that can be used on many mares with good success, and that is the hot saline solution, which will be discussed in the next issue. This seems to stimulate these organs and perform their functions better than any other method we know of. Or there may be a little acid which may be readily diagnosed with litmus paper. The soda treatment will rectify this.

ARABIAN HORSES—Can you tell me why there are not more Arabian horses in this country? I consider them the finest horses that grow.—Illinois Subscriber.

REPLY—We do not know why there are not more Arabian horses in this country.

BREEDING TWO YEAR OLD MARES—Please tell me if I can breed a young Percheron mare. She will be two years old the 28th day of April. Some say it is all right and others say she is too young. She is good size for her age and we have a good young Percheron stallion in the country that will be three years old this summer. Please tell me if that would stop her from growing? If it does I will not breed her.—Minnesota Subscriber.

REPLY—Your mare will not get quite as large by being bred at two years of age as she would if bred at three years old, but if you could get her with foal at two years old she will probably be a more regular producer and a better mother. If you will break this mare to harness this summer, and work her just enough so she will be nicely broken without any exertion, and give her all the feed she wants, it will not retard her growth much at maturity. We usually advise breeding two year old fillies when they are in good hands that know how to feed them.

THREE YEAR OLD STALLION—I have a young Percheron three years old the 17th day of May and I would like to breed all the mares that will come to me. Would you please give me all the instructions necessary to breed with the capsules; tell me what instruments I should have and the price. I would like to have an illustration of a mare so I could see how to proceed with the capsules. I bred 12 mares last summer with him and they are all in foal.—Minnesota Subscriber.

REPLY—You will find instructions in the March 5th issue for capsule breeding In the April 5th issue we will print illustrations of the generative organs so that you should know their location. Carefully study the lessons in the American Breeder school. We believe you can make a success of capsule breeding if you follow the instructions.

Johnson Automatic Stallion Bridle

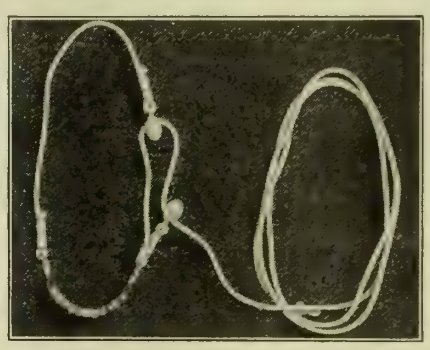
(Patent Applied for Nov. 10, 1909.)

Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.



"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning, Jr., at once. Send by mail. —Val. Thomas, Jr., Hopedale, Ill."

"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one.—E. A. Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not not use with a chain under his jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he can not say too much for it.—De Mott & Son, Scottsbluff, Neb."

PETER YOUNG
Assumption, Christian County, Illinois.

"CONQUEROR" STALLION BRIDLE

GUARANTEED TO HOLD ANY STALLION OR JACK.

This bridle is made of especially selected material, absolutely the best on the market.

Can be adjusted to fit any size head and for either hard or tender mouths.

Just the thing for breaking runaways or kickers.

Never tie an animal with this bridle. If he got to pulling he could split his head.

We prepay the postage or express charges and sell these bridles at **$2.50 each.**

LET US SEND OUR LARGE HARNESS CATALOG

DO NOT BUY HARNESS of any kind until you have seen our catalogue. We are selling strictly custom-made harness, The Famous Aniser Brand, direct from our factory to the farmer. WE SAVE $10.00 to $15.00 per set. OUR CATALOGUE illustrates 1500 bargains in harness, saddles, buggies and wagons, it should be in every farmer's hand as a Buyer's Guide. Free upon request. SEND FOR IT TODAY.

ANISER HARNESS MFG. CO., Dept. 132X, St. Joseph, Mo.

STALLION and JACK CUTS

We can furnish cuts for bills, letter heads and all kinds of stallion and jack advertising.

A New Line, True to Life, The Best Work, Prices Low.

Send for sample sheet and subscribers' prices.

N. B.—We do not do any printing. We simply furnish the cuts.

BREEDING APPLIANCES OF ALL KINDS

THE IMPROVED CARLSON SEMEN EXTRACTOR AND CAPSULE SYRINGE

This extractor has been improved so that it is much easier to use. The proper temperature can easily be maintained. Anyone should have good results with this instrument by following the directions carefully. This is the only instrument made that has been successfully used for getting the semen from the uterus. We believe this instrument with its improvements will make it possible for any ordinary breeder to use the capsule system successfully. It has a soft metallic point that will stand bending a thousand times. All necessary directions will be sent with the instrument.

Special Offer: 50 pointed breeding capsules, price $1.00; a tested hot water thermometer, price $1.00; the improved Carlson semen extractor, price $7.50; **ALL FOR $7.50.**

Microscopes

For use in testing the semen of stallions or jacks. Magnifies 500 times and is used by veterinarians and physicians. Price $35.. Boxed in fine case. These instruments are of great value in the breeding business. Through them you can see for yourself and show your mare owner the live spermatozoa of your sire.

Thermometer

Tested and used for keeping water at the right temperature.

Price, $1.00.

Veterinary Thermometers

This thermometer is recognized and used by the leading veterinarians for taking the temperature of animals. It has a metal case which insures it against breaking and will last a life-time. It has a small chain with pin in it that may be fastened to the vest pocket and carried with safety.

Price, $1.25.

Curved Metal Impregnator

This instrument is sold by other dealers for from $5 to $6. It is nickel plated, about 22 inches long, with a glass tube in it.

Price, $4.00.

SPECULUM.
Made of Good Material, Nickel Plated, Will Last a Life-time.
Price, $3.00.

Pointed Breeding Capsules

We have the only capsules made especially for horse breeding Some capsules do not dissolve, leaving a foreign substance in the uterus which will prevent conception. Other capsules are too flimsy to use for this purpose. You cannot make any mistake by buying capsules from us as we only have one kind. We have them boxed with 100 in each box. The box is tight so they will be clean. These capsules are properly baked and all bacteria killed before they are mailed. Always keep the lid on the box when not in use.

Price per box (100), $1.50.

Bulb Impregnator

This is the best bulb impregnator on the market. Some dealers sell for $5 and $6.

Price, $2.00.

Breeders' Bags

Three sizes, small, medium and large. Stallions weighing 1,200 or 1,600 pounds usually require a medium size. These bags are guaranteed not to tear from any cause before March 1, 1914. If they do tear before that time return the top part with our stamp on it and 35 cents in [illegible] and we will send you a new bag.

Price each, $1.00.

Directions for Ordering

Send money orders or draft as exchange is always charged on personal checks. Always name your express office as well as your post office address in order to insure prompt delivery.

POSTAGE AND EXPRESS PAID ON ALL ORDERS.

Breeding To Fit The Market

An Essential Every Farmer Should Study in Selecting His Brood Mares and in Mating Them. Horse Classes Which the Trade Demands.

By Prof. E. A. Trowbridge, Missouri College of Agriculture.

The production of horses in the United States has come to be one of the most important branches of agricultural production. Because of the annual value of the horses produced and the profit which may accrue therefrom it is of the utmost importance that the best methods of both breeding and development be used. The production of horses works upon such a system that the profit or loss does not appear as directly traceable to the industry as it does in the case of meat producing animals. This is because of the fact that the horse not only yields a profit as a salable product but performs the labor upon the average farm. A careful study of the situation as it exists today reveals the fact that while considerable improvement has been made in the horses produced in this country there still exists an opportunity for greater improvement and thereby a greater profit.

Unquestionably one of the greatest difficulties which stands in the way of the greater profit from this line of agricultural production is a lack of acquaintance on the part of the producer with the market standards. Unfortunately the fault in this case cannot be laid at the door of the buyer. His demands exist for certain classes of horses. The actual value placed upon a given horse is made by his capacity to meet a certain demand. The demand on the market exists for given types of horses and is comparatively stable, but this is not the case with the producer. On the contrary, the man who produces the horses makes use of those animals on hand. If his horses are large he uses them as best he can. If they are small he does the same thing. It is quite probable that a little closer attention to the types of horses used and produced would not only yield a more salable market horse, but in many cases also a type of horse which would more efficiently perform ordinary farm labor. While a casual glance at market quotations shows a large number of so-called market classes, yet a closer study of the same quotations reveals the fact that there are only a few really standard classes. Those standard classes in the main are Draft Horses, Carriage Horses, Roadsters and Saddlers. The other classes consist of those horses which do not fill any of the four above named market specifications and consequently fall between or below them. Observation of the prices will show that the really high prices are received only for the high class Drafters, Carriage Horses, Roadsters or Saddle Horses.

If breeders of horses are producing horses for their own use on their own farms or for their own particular kind of work, they ought to be able to discover the type of horse that best suits their needs. It is hardly logical for any man to attempt to dictate or advise in the case just mentioned. Yet in the case of the average producer of horses that are to sell on the open market, and in many cases for these horses to be used at home, a few suggestions may serve a good purpose.

A visit to a great city with the idea in view of carefully studying the types of horses used and thereby acquainting ones self with the type of horse demanded from the producer, proves valuable to any man. No better place than the Union Stock Yards can be selected for the observation of horses and of the types in greatest demand on the market. To the country horseman in the Union Stock Yards, one of the most noticeable things is the condition in which draft horses are kept. These teams which haul the wagons for the packing houses and extensive transfer firms are in higher condition so far as flesh is concerned than the average farm horse. An investigation as to the cause of these horses being kept in high condition reveals as a reason, the fact that weight is of the utmost importance where horses are to be worked over comparatively smoothe pavements. On such streets a horse's greatest ability to pull comes from his own weight, because of the fact that he has no opportunity to get a good firm footing and exert his muscles. No more striking example of the value of weight in draft horses can be had than this. Another noticeable feature of the draft horse is the fact that those which stand the wear and tear best, and have been in service longest are those with good feet and legs. A casual investigation shows that with the great weight necessary and the hard streets which are used, a good set of feet and legs is absolutely essential to longevity of service in draft horses. The same general conditions apply to light horses being used on the streets of our cities, either for pleasure or business purposes. They are of a comparatively uniform size and type. They are horses possessing an ability to get over the ground at a reasonable rate of speed. They are well broken and possess a conformation showing constitution and vigor. If they have lasted any length of time under the conditions which obtain in our cities they possess the most desirable quality of feet and legs.

While there are many unsound horses seen passing through our markets and found on the streets of our cities, the sound ones are decidedly preferable. This is a factor even more important among city horses than among farm horses, because of the fact that the horses used for city work yield their only income through the work which they perform. Any unsoundness, therefore, which in any way hinders the service which they can render, greatly decreases their value. Farm horses which possess some unsoundnesses can still do much farm work, and in the case of mares, they can be used for breeding purposes. One does not argue that the use of unsound mares is advisable, yet surprisingly large numbers of mares will be found performing just this function on the average farm.

In order to make the business of horse production yield the greatest profit, then, it is highly advisable to give the matter of markets a close consideration. It is equally important that we give some attention to the horses from which these horses are to come—from the foundation stock out of which we have to build the horses of the future.

The high class Drafter is the horse with size, substance, constitution, quality, action and ability to haul heavy loads over hard streets or roads.

High class Carriage Horses are composed of those individuals which possess smooth, evenly turned, symmetrical conformation with ample quality and true high action both in front and behind. Excessive speed is not necessary. Since the principal function of Carriage Horses is to carry good harness, haul attractive vehicles, and to make as good an appearance as possible, beauty and symmetry are of particular importance. Size is required up to the point of being able to haul the average carriage or other pleasure vehicle.

The high class Roadster or American Trotting Horse is the horse of good conformation and quality, with considerable speed and the ability to get over the ground for comparatively long distances at a rapid rate. Excessively high action is not desired in this type of horse. The most convenient size seems to be fifteen to sixteen hands, with weight ranging from 1,000 to 1,500 pounds.

The Saddle Horse of either the three or five gaited variety, must be beautiful in his conformation, showing more quality than any other type of horse which goes to the market. His head must be clean cut and definite, his neck long and properly set on his body, his withers narrow and comparatively high, his back strong and his rump long and level, with a well carried tail. In action the three-gaited horse must show the walk, the trot, and the canter, while the five-gaited horse, in addition to these three gaits, must show the rack and either a slow pace, a fox-trot, or a running walk.

In all of the above classes, and in fact, with any horse that goes to market, soundness is important. Horses sell best between the ages of five and eight years and usually solid colors are preferred. Well broken horses are at a premium, particularly in the saddle and harness classes. A lack of attention to these points often makes a difference between profit and loss when horses are shipped to our city markets.

The question next arises as to what available material exists for the production of horses of the above named classes. The general improvement which must occur in any given line of live stock production must come largely through the use of good sires because of the sire's effect upon such a comparatively large number of individuals of each generation. The use of inferior, nondescript sires, while yet practiced to some extent, has long since been found to be one of the factors which tends to decrease the profit, hence in the selection of sires we are forced to look to the ranks of registered stallions.

We find, upon investigation, that the breeds of horses divide themselves much the same way as do the market grades and classes. Practically none of the horses which go on the market to sell are registered horses. They are in most cases horses of more or less mixed breeding, and at best only

What Are Your Other Interests?

Many a letterhead that comes in the American Breeder mail shows that the sender has other important farm and live stock interests besides the breeding of horse and jack stock. Many of our readers raise pure bred cattle, hogs, sheep or poultry. Some specialize in improved seed corn. Some are fruit growers and a great many do general farming on a considerable scale. It will be of great interts to all of us to know something about the things which concern the readers of the American Breeder in addition to the special business which has brought us all into this one great family. Think of the good we have gotten out of discussions and experiences and questions along this one line. Let us have some of it in other lines. Let us have one issue in which each contributor tells something about another line of live stock or farming in which he is particularly interested. Young calves, pigs (and lambs, in some localities) present many problems to be solved at this time of year. The care of their dams is important. Early pasturing, fences, mud (in some sections), high winds and cold spring rains enter into the matter of care, as much as the feeding, doctoring and attention at the time of parturition. The subject of breeds is always interesting, and the characteristics of breeds are always important, as they often determine the fitness of a breed for a certain locality or condition.

We have many readers who can speak from experience on some of these subjects. Many others, doubtless, have questions they would like to ask for older heads to answer. Let us have them—a lot of them—by May 1, for our issue of May 5

high grades of a given breed. This fact points to the mare stock which exists in the country. It consists of native and grade mares approaching the standard of the high class market horses, in some cases closely, in others only remotely or scarcely at all. With this class of mares, and stallions from the ranks of the good registered horses their future production will yield the greatest profit.

There exists five principal breeds of draft horses, viz: Percherons, English Shires, Belgians, Clydesdales and Suffolk Punch. Good individuals of any one of these breeds may be used to produce high class draft horses, and the inferior stallions of these breeds should be discarded as quickly as the unregistered inferior stallion. It is highly advisable in most cases that these breeds be maintained separate and not crossed back and forth. Cross-breeding among the breeds of draft horses tends to break up and leads to a lack of uniformity.

For the production of high class Carriage horses or heavy harness horses, the American Trotting stallion of proper type, quality and action, and the Hackney, have met with the greatest success in this country.

The Roadster and the American trotter are the result of the use of good sires from the breed of American Trotting horses. This breed has been developed particularly for use in this country. Consequently other breeds are handicapped in competing with them in the production of this type of horses, and comparatively no other blood appears in our road horses and trotters than that of the American Trotting horse.

The three-gaited Saddle horse has been produced by different systems of breeding. Some of them have carried portions of Hackney blood, some have been American Trotting horses, still some others of thoroughbred lineage and more frequently are they found to trace to American Saddle horses. The type of horse demanded is that of extreme finish, quality and beauty, as well as intelligence, and these characters seem to be more readily obtained through the use of American Saddle horses. The five-gaited horse has only one principal source of lineage, viz: The American breed developed for that purpose.

In the use of sires of these various breeds many horses will appear as offspring which do not possess the desirable characteristics to the marked degree that is found in their sires. This may be due in some cases to the fact that the stallions are not prepotent, but in the majority of cases it is due to the fact that they have been mated with native mares of more or less indiscriminate lineage. As time goes on it is to be supposed that the mare stock of the country will be "graded up" in one line or the other until they more nearly approach the type of high priced horses on the market. When this is the case the use of high class stallions of similar breeds will lead to a more certain production of a high class lot of market horses.

It is evident that there is not a recognized breed of horses with which to supply each of the market grades. The question may be asked as to why this is the case, but a casual study of the situation will bring to light the fact that many of the less stable and cheaper classes of horses are not demanded in large enough numbers to make the establishment of a breed for that purpose worth while. The fact will also present itself that by the time a breed could be established (and this would take from 25 to 50 years at least), the demand for that type of horse might have become extinct. Time has proven that the demand for the four principal classes named above is stable and the grades of these various breeds will supply the demand of practically all of the market grades and classes, hence the advisability of the establishment of a new breed to meet any of these minor demands would be questionable.

In conclusion it can be said that in our horse production it has proven more profitable to aim at the production of horses which will meet a constant, steady demand at comparatively high average prices. In so doing failures are all too frequent. An important feature in this scheme of production will be the gradual "grading up" of the producing mares throughout the country toward one or the other of these types. This can be accomplished more rapidly if the breeds are kept entirely separate. The man who starts out by using a Percheron sire will find it profitable in the long run to continue using a Percheron sire for several generations. This will not only result in the production of a high class lot of market horses, but an excellent lot of grade mares for breeding purposes. Lastly, the sires used should be only the very best that can be secured in a given breed and only high class registered sires should be used, if the best results are to be expected. While this system of production is comparatively simple, it has been carried out with remarkable success by many men and the best proof of its value is the fact that those men who have followed the practices herein named longest are continuing the same practice because they have received satisfactory profits.

AN EQUITABLE "STAND AND SUCK" PLAN.

To the American Breeder: What is your idea of the "stand and suck" proposition for breeders, and where it is well established, how is the best way to better conditions? I think it would ruin any one's business to make any direct changes. I am trying to organize the stallion owners in some sort of a way to get them to work together. I want first to have each mare owner to pay some small amount of money, say $2 or $3, in advance for each mare, then let the balance of the amount go on the stand and suck plan. Second, I want each and every one of the stallion owners to use the same books, contracts and bills. It always has been the rule to sell any mares that are in foal and have the service fee follow the mare and be collected from the man that gets colt; not the man that bred the mare. We have all these things specified in our bills, but the custom of the country is so strong, and the stallion owners so weak, that it makes it almost impossible for any one man to change things. We have lots of cheap grade horses here; they are home bred and home raised. I am on good business terms with all my competitors. I am not a chronic kicker but I would like to better the conditions of the horse business. — Hurley Morris, Martin County, Minn.

Let us have suggestions from other breeders who have experience with similar conditions.—Editor.

EDUCATION PROBABLY THE ONLY MEANS.

To the American Breeder: I have noticed the discussion going on in the columns of your paper in regard to licensing the owners of brood mares and requiring them to use only sound animals. I might call attention to the fact that this would be a rather difficult type of legislation to bring about and might be considered unconstitutional, because the private mare owner is not in public service the way that the stallion owner is. I heartily sympathize with the idea of giving the stallion man some protection, as well as the mare owner, and think that it would be one of the greatest boons to the business as it stands at present, but fear that there might be real difficulty in such a way as proposed at present. — Edw. H. Wentworth, Story County, Ia.

Questions and Answers.

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

NEGLECTED STALLION—I bought a stud recently that has run in a box stall all winter without exercise. Two days ago we found him with the caps on both stifle bones or caps loose. We called a veterinarian and he told us to walk the horse about four miles a day, and if necessary put blister on inside of stifle joint. You will understand the cap slips off only now and then, especially when he turns sharply, and when he walks straight ahead he has no trouble. The exercise seems to help. Would a long paddock help, or should we turn him loose? The veterinarian claims that the inside muscle controlling the caps has relaxed and the outside muscle contracted. This trouble does not belong to this horse as he is six years old and has never shown it before. Are we treating him correctly?—Ohio Subscriber.

REPLY—If the owner was submitted to the same kind of treatment he sometimes gives his stallion for a whole winter, he would the better appreciate his errors. As matters are, we think the advice you are receiving, and care you are giving the animal, are along correct lines.

PYOMETRA—I have been breeding my own stock for 17 years. I have found three mares that appeared to be all right; when I examined them I found the mouth of their wombs closed tight. When I entered my finger into their wombs corruption commenced to run out; two of them passed out about two gallons. Would like to know what you think caused this. I examine every mare that comes to my stock unless she has a young colt. —Oklahoma Subscriber.

REPLY—Such cases are the result of infection and should not be bred in their present state under any consideration. They should be turned over to some veterinarian capable of treating such conditions, and should never be bred until perfectly sound.

BREEDING MARES—When should a mare be bred, the ninth, eighteenth or twenty-first day?—Missouri Subscriber.

REPLY—From the sixth to the ninth day after foaling is the proper time to breed mares. They should be returned and tried on the 21st day after being bred.

FEEDING CANE—Will it hurt to feed a stallion a little cane that I cut with the corn harvester? The stalks are full of sweet juice and the horses like it. Will it hurt his breeding qualities?—Ohio Subscriber.

REPLY—A moderate amount of cane will do your stallion no harm, but be very careful you do not overdo the matter. Animals, like people, relish a little change in diet, which should be gratified. The trouble comes when the owner overfeeds because the animal is fond of some particular food.

EATING WOOD—I have a small black mare that is used nearly altogether for saddling. She is always chewing the wood around her manger. I would like to know what to do for her. She isn't a cribber?—Wisconsin Subscriber.

REPLY—This may be merely a habit, but frequently the animal is craving something in the way of alkalies. Be sure that she always has salt within easy reach, which should be mixed with clean wood or cob ashes. Such an animal should have access to pasture for a part of the season at least.

REGISTERING MORGAN HORSES—Can a colt from Star of Kentucky 4806, and a trotting bred mare (not registered) be registered in the Morgan Register? What will it cost, or where would I write to find out?—Illinois Subscriber.

REPLY—We think the colt from this union can be registered in the Morgan Register. Write to T. E. Boyce, Middlebury, Vt., secretary of the Morgan Register, for this information.

RUPTURED COLT—I have a nice, strong colt; will be a year old in May. He has a rupture on the bottom of his belly; he has had it since he was foaled, but it was not very big, but this winter it has been getting bigger all the time. What can I do for him?—North Dakota Subscriber.

REPLY—The only thing to do at this time is to take your colt to a good, competent surgeon and have him operated on. The fact that the opening is getting larger should be a warning that you should not delay this matter.

SLOW STALLION—I have a Percheron stallion in perfect health and very ambitious, and a good teaser, but he cannot serve a mare; that is, he never gets ready; penis won't get hard. I give him two miles of exercise daily; feed oats and kafir corn. Any information will be appreciated.—Oklahoma Subscriber.

REPLY—Turn this stallion loose with a mare in good heat. Give us a description of this horse; age, how he has been used. Give details.

CHRONIC MAMMITIS—I have a jennet that had a colt last July off in a pasture, and the colt died; it was several days before any one noticed her, and when we found the colt it was mostly decayed, and on examining the jennet found her bag had spoiled and broke in several places. I have her in foal again, due to foal in January. I would like to know if her bag is liable to gather and break again at foaling time. Do you think she would raise a colt all right providing it lived to suck her, or would the milk be good for the colt?—Alabama Subscriber.

REPLY—You will be very fortunate indeed if yourself, the jennet and the prospective foal escape trouble under the present conditions of the jennet. The period of foaling will very likely arouse the inflammation in the already diseased udder, and you will be extremely lucky if you do not lose the foal, provided it is permitted to nurse a diseased udder.

TALL PERCHERON MARE—I have a Percheron mare that weighs a little over 1,500 pounds and is rather tall and lengthy. Would she make a good cross with a jack?—Iowa Subscriber.

REPLY—The better the mare, the more likely she is to produce a good mule. If, in your opinion, this mare would not produce a good horse colt, she would be a good candidate to breed to a jack. Almost any kind of a mare will raise a marketable mule. This has been plainly shown from the fact that most mules are produced from the poorest mares, yet the price of mules per head is higher than that of horses. The best mule mares are, however, as a rule, those having plenty of room and not too much daylight under them.

ABSCESS IN THE UDDER—I have a mare that has a swollen bag. After she weaned her colt last fall she dried up all right and after she was dry the colt sucked her now and then. About three months ago one-half of her udder only was affected. That half was lanced and broke and run a number of times and does not get any better. The mare is in good shape. Can you tell me anything to do for her? Would it be safe to breed her again?—South Dakota Subscriber.

REPLY—Your mare's udder has become infected in some way and the condition as now existing will be very difficult to cure. It is quite likely that she is ruined for breeding purposes for the reason that the affected half will fire up and cause trouble at foaling time. The quickest way to get rid of the annoyance of the abscess condition is to have a competent veterinarian remove the affected half.

This can be done successfully by a good man.

INJURED JACK—Have an eleven months old colt which bruised his back by getting under the partition. He is hardly able to support himself on his hind legs and cannot get up without assistance. Do you think he is hurt in the back and will he recover?—Minnesota Subscriber.

REPLY—Your inquiry would indicate that your colt was injured in the back and these injuries are often very slow to recover. The colt should be kept in a lot or paddock by itself where it will not be annoyed by other stock, and a good stimulating liniment applied to the back at least once daily. The following will serve very well: Alcohol 28 ounces, gum camphor one-half ounce, oil of origanum one ounce, oil of sassafras one ounce, aqua ammonia sufficient to make one quart. Mix all together and rub in well with the hand along the affected part.

BEST DRAFT BREED—Which is the longest lived horse as a breed, the Belgian or Clydesdale? Which would be the best breed to raise to put on the city markets? Doesn't the Clyde have better bone or larger bone below the knee and hock than the Belgian? Any information you can give me on picking a horse from the two breeds would be very much appreciated.—Utah Subscriber.

REPLY—This is an important subject and we believe a subject worthy of discussion. Why not let the readers of this paper give their opinion on this subject, and not confine it to any one breed? A few short letters will be appreciated.

OPENING MARES—Should a mare be opened up so as to get one or two fingers in? Where could I get a dilator? Is one needed?—Missouri Subscriber.

REPLY—One finger is sufficient; you don't need a dilator. Never forget, however, the necessity of cleanliness.

INSERTING CAPSULES—Please inform me how to insert a capsule; what appliances to use, and is it right to put capsules into the womb?—Washington Subscriber.

REPLY—Place the lid on the capsule and insert it into the womb with the pointed end first. Pointed capsules are more easily inserted. There is no necessity for any appliances for inserting capsules. Keep the capsule covered with the hand to keep it warm and away from the light.

DISEASED UTERUS—In opening up a mare I withdrew my hand and found stuff on it resembling lard, thick, whitish stuff, not ropey. I have examined hundreds of mares, but this is the only one I ever found this way. It was as near like lard as could be. I don't think there was any odor to it at all. I did not breed her and told my neighbor to have her examined by a veterinarian and I'd pay the bill. Any information will be appreciated.—Illinois Subscriber.

REPLY—This condition is not uncommon and is one of the several states the contents will be found in when the uterus is infected. You did perfectly right in not breeding the mare inasmuch as she should have medical attention and rest that she may be given an opportunity to get sound before being bred.

SUSPECTED STRINGHALT—I have a mule that has a bad habit of raising his hind legs when he starts. He is some better than he was when I got him (about three weeks ago); it does not seem like the string halt. I started to trim his hind hoofs which had long been neglected. I never saw a foot like it. The outside shell was hard and tough; the part next to it was springy, the pinchers would hardly go in it. The frog seems all right; when I cut in spongy part it had a red streak in it in one place.—Kansas Subscriber.

REPLY—We suspect your mule to be affected with stringhalt and it will very likely improve somewhat with the coming warm weather. It will pay you to take it to a competent veterinarian so that a personal examination may be made in order to remove all doubt.

BREEDING OUT OF HEAT—Is it profitable to breed mares out of season with the capsule system?—California Subscriber.

REPLY—The best possible time to breed shy breeding mares, as a rule, is about two days after the heat period has closed. When mares are bred out of heat they should be bred only with capsules. It is not advisable to breed mares out of heat the first year in a community, as many mare owners are skeptical about new methods. A lot of breeders contend that mares will not fertilize while they are not in heat. Mares bred several days after the heat period has closed may get with foal and yet come in heat at the next heat period. This is another difficulty with breeding out of heat the first year. The average mare owner wants his mare bred when she comes in heat. As a rule, mares will get in foal as well when bred out of heat as they would if they were in heat. It is frequently very convenient to breed several mares at one time.

HERNIA—I have a draft mare colt which will be a year old this spring. She has a rupture back of the navel. I noticed it first when she was about four months old. The hole was about the size of a dollar; it was down about an inch. My neighbors said she would get all right so I did nothing. It seems some better, I think. Do you think it will get well? If you can help me I will appreciate it.—Kansas Subscriber.

REPLY—You should not delay longer in having this matter attended to as the colt will very likely not recover itself, and the longer it goes the more difficult it is to effect a cure. You should not permit any one to meddle with this case at this time excepting a qualified surgeon, as these cases are difficult at this age.

MARES KEPT IN A BASEMENT—I have two young mares that I cannot get in foal. I have bred them two seasons, but they are not in foal yet. They are not too loose or too tight; they are in fine shape all around. The only thing that I can find is that they stand in a basement stable and I think it is too cool for a brood mare in summer or in breeding season. Is there anything in it or not?—Minnesota Subscriber.

REPLY—Poorly ventilated barns are injurious from a breeding standpoint, the change in temperature might cause them to take cold. We are of the opinion that if these mares are properly cared for in a well ventilated basement, that this would not be serious. Basement barns, however, are not to be encouraged for any kind of live stock unless they are exceptionally well lighted. We would be glad to have the opinion of breeders concerning basement barns from a breeding standpoint.

COLLAR WOUND—I bought a mule about three weeks ago; used him on light work since. One day I hauled a load of hay seven miles, he was one of the four used; the roads were dry but spongy. The next day I took him and three others for a load of coal 14 miles away. This morning was the next day; the bottom of his shoulder had little pimples on and when the collar pressed on them they broke. It seemed to pain him at first. I took a collar pad and cut the hair out of it. Is that all I can do for him? Is there any medicine that will cure him?—Kansas Subscriber.

REPLY—It should be plain that the trouble originated from a collar abrasion as the mule was not fully hardened to the work. The safest practice is to discontinue the mule

(Continued on page 17.)

Why He Doesn't Subscribe

To the American Breeder: Received your sample copy tonight and wish to thank you for it. I think it is a great paper and the only reason I do not subscribe for it is that my son takes the paper, and as we live and work together, one paper is enough for us. I do not have time to read much but my son reads it most from cover to cover. He thinks it is full of good things and desires to thank you for the series of lessons you have started. I think all stock men ought to hang together and work together with you in bringing all crooks to justice, and for the moral uplift in the horse breeding world.—Edmond Hough, Porter County, Indiana.

Percheron Society Affairs

The plan of asking the Percheron breeders to select four candidates as directors for the next Percheron election, seems to have met with much favor. By this method the breeders will have opportunity to investigate the candidates, and are assured also of opportunity to express their own opinions—they are given a chance to be heard. Many breeders are asking that we suggest who the candidates shall be. This is not a matter for a newspaper to decide. It is a case where the breeders themselves should select from among their number, candidates who will best serve their interests. A good many have sent in lists stating their preference. The result of these votes will be printed in the near future.

We believe the candidates selected by this method will be good, clean, honest men who can be trusted to represent the breeders. They should be men of some means and actively engaged in breeding Percherons, so that they will be willing and able to make a strong fight for the best interests of the breed. This next election will not be one of those one-sided affairs that have been too common heretofore. Provision will be made for a contest so that the issues of election may be honestly tried in court.

Several have asked why the proxy committee was not a fair way of voting. Some state that the breeders have, by that method, an opportunity of naming whom they wish to represent them.

The difficulty with the proxy committee is, or has been, that the men named on the proxy cards sent out by the secretary have voted for the re-election of officers. A large number of Percheron breeders have paid too little attention to the election of officers; they have simply sent their proxy card to the proxy committee. This makes it possible to have a large number of what might be termed "influenced" votes, or in other words, votes of those who are not particular about who is elected; the proxy card is sent to them and they sign it and send it to the Percheron headquarters. Those who are favorable to clean pedigrees have not been working unitedly; they have not been organized. Good men in different states or sections are not enough acquainted with each other so that they have not been able to unite on candidates. There is only one exception and that occurred in the election of 1911, when the Percheron breeders were fairly well organized. This year the election of candidates favorable to clean pedigrees should not be hard if every one will do his part.

If every Percheron breeder will 'phone or visit others interested there will not be many proxy cards sent to the proxy committee at Chicago this year.

It was suggested at the last annual election that the proxy plan of voting should be dispensed with, but H. G. McMillan and W. S. Dunham both made speeches favoring the proxy committee. This, perhaps, is not the first time that W. S. Dunham and H. G. McMillan have stood together. It might be remembered that W. S. Dunham was one of the first to spring to the rescue of H. G. McMillan and to sign his name to an alleged investigation of evidence showing that one of H. G. McMillan's mares was claimed to have produced a dozen colts, after (according to H. G. McMillan's own statement) she had died. J. L. De Lancey also signed that famous alleged investigation. It was no surprise that De Lancey should sign the "white wash," as he has been on the salaried list (partially by the grace of H. G. McMillan) for these many years, as treasurer of the Percheron Society of America. But we were surprised at the great interest that W. S. Dunham has taken in the defense of H. G. McMillan. Here are three men who have seemingly stood together for these many years. What is the connection? Of course, De Lancey wants that salary. Why is Dunham so much interested in H. G. McMillan? Why is he ever ready with both time and money to shield H. G. McMillan? We will leave this matter with the Percheron breeders.

Several breeders have written to ask what states these four directors should come from and what men of the right type would pull the most votes. It seems that the Percheron breeders have come to the conclusion that if peace and harmony in their association shall prevail, that they must take part, and break up the perpetual re-elections. Many of them have realized that it is up to them to do their part of this work, and that if necessary they could be depended upon to make a good fight. They realize that the society can never grow and prosper as it should grow, with the stain now on it. Nearly every letter received here states that they are not in favor of the "white wash" method.

In this connection we note an interesting thing in the 'make up" of Volume 14 of the Percheron Stud Book. All of the officers have their photographs in that volume. Why is H. G. McMillan placed at the top and the president and vice-president placed at the bottom? Why is H. G. McMillan's name at the top of every committee he is a member of? What is the object in displaying this man? A complete "white wash" was administered once. Has this method been taken to convince Percheron breeders that the "white wash" was genuine? This is about the rankest proposition that was ever put over on the American people. Those "white wash" statements might appear to vindicate him in everything he has done, when, as a matter of fact, he is probably the worst disgraced man in the live stock business in America today. Will this kind of business be of any benefit to the honest Percheron breeders who are registering horses honestly?

In order to know who the present directors are, so that the breeders can consider what sections should be represented by new candidates, we publish below a list of the present officers:

Alfalfa hay is easier to cure than clover because of its larger leaf surface and a little rain does not destroy its feeding value. The best time to cut the crop is when the new shoots are found making their appearance. —Illinois Farmers' Institute Bulletin.

AMERICAN BREEDER'S SCHOOL (Horse Breeding LESSON II)

Anatomy of the Female Generative Organs

This is one of a series of lessons prepared expressly for the thousands of our readers whose business requires thorough, systematic instruction on breeding subjects, but who so far have been unable to get away from their homes to take, personally, a regular course of study in a breeding school. These lessons do not in any sense constitute a "correspondence school"—they cost nothing to our subscribers and no "diplomas" are given. We are simply going much farther in the direction of careful, practical instruction on an important but difficult subject, than any agricultural publication has heretofore thought of going, knowing that such a series of articles, if properly studied, will be very valuable, both to those who follow it later in a regular school, and to those who cannot. As a feature, or department of this paper, therefore, we offer the "American Breeder's School" to the thousands of breeders on our lists who seek advancement in their business. As long as our supply lasts we will send the issue of March 5 (which contained the first lesson—"Generative Organs of the Male"—to every new subscriber who requests it. One dollar for a year's subscription to the American Breeder is all we ask any one to pay for the full series.

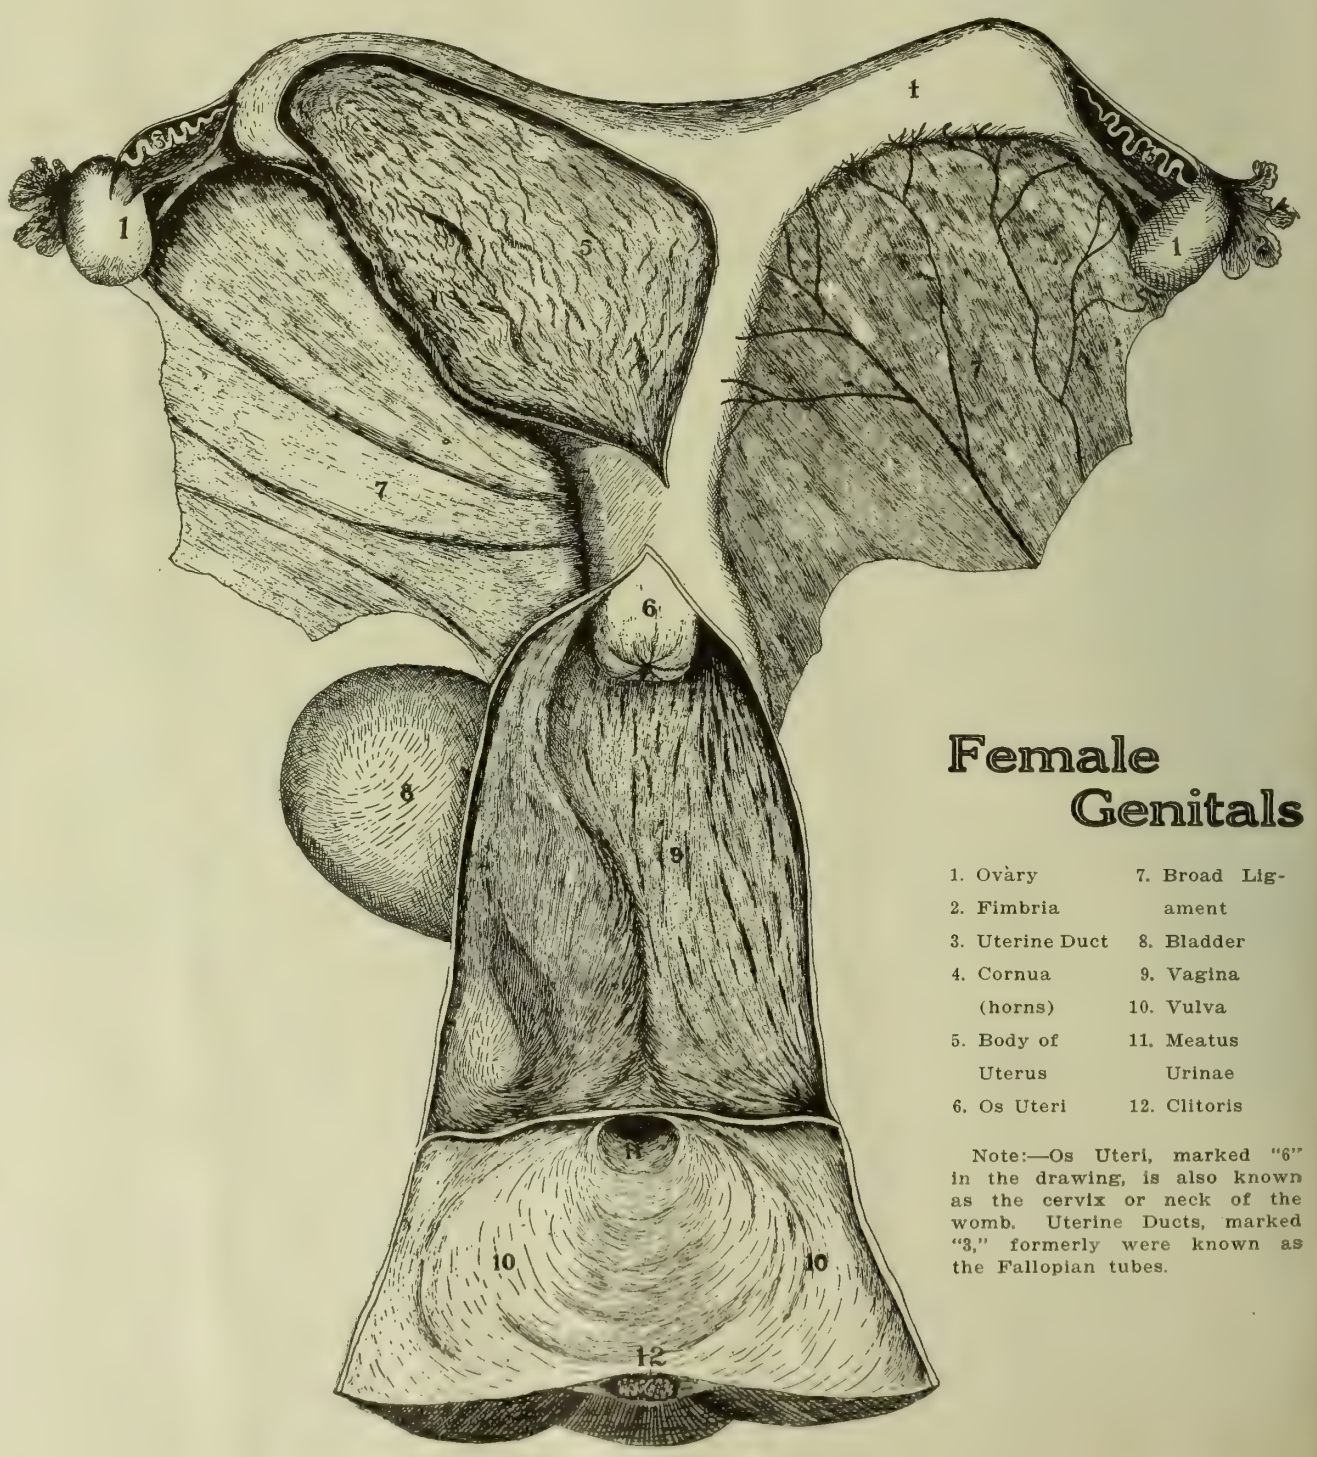
THE OVARIES resemble very much the testicles of the male, being corresponding organs. They are ovoid in shape and smaller than the testicles. They occupy a position in the sublumbar region (beneath the backbone) near the kidneys, and are supported in position by the broad or suspensory ligament and the vessels which supply them with blood. They are surrounded on their outer surface with a thin shiny coat which is a continuation of the membrane that is seen on the surface of the bowels and inside the cavity. Beneath this membrane is a strong, tough envelope that forms the true covering of the ovary (tunica albuginea).

Upon cutting into an ovary it will be found that its true substance is of a reddish white color and it is within this tissue that the ova are found. Small round ovisacs (Graafian vesicles) invest the ova, and it will be noticed as any particular ovum develops that the Graafian vesicle also enlarges and that it, with its contained ovum gradually works toward the surface of the ovary. By the time the ovum has matured the Graafian vesicle has reached the surface, and, dissolving the investing coat of the ovary it bursts on the surface. It must be remembered that the ovum is a cell about 1-150th of an inch in diameter and it is a perfectly passive body; that is, it is unlike the spermatozoa in respect to power of movement. It must depend upon the action of some neighboring part for guidance into its proper channels. At the upper end of the tube that forms the connection between the ovary and horn of the uterus there are certain expanded finger-like structures (fimbria) that serve to grasp and direct the released ovum into the canal that leads to the uterus.

These fimbria possess the power of moving about and applying themselves to that point where the ovum is being released. Should they fail in their function of properly directing the ovum it may happen that the latter will drop off into space, and coming in contact with some of the neighboring organs may undergo at least partial development provided it has been fecundated by having come in contact with a spermatozoon. These foetal developments which take place outside of the uterus are alluded to as extra uterine gestations.

There is abundant proof that these extra uterine gestations are of rather frequent occurrence as shown by the various post-mortem findings in large packing houses where food animals are slaughtered. The ovary then is the gland or organ wherein the female cell or ovum is developed, and when one of these cells is released it is directed into the uterine duct through which it may pass to the uterus.

THE UTERINE DUCTS or Fallopian tubes, are two very small tubes that communicate with the ovaries at the one end by means of their finger-like processes or fimbria and with the horns of the uterus at the other end. They are arranged in a very convoluted or wavy-like manner which serves to retard the progress of the ovum through them. It is thought that fecundation usually takes place along the course of these constricted tubes as their small diameter favors the upward moving spermatozoa coming in close contact with the descending ovum. The ovum is aided in its progress in the direction of the uterus by the cells that line the uterine duct. These lining cells are little column like processes having minute hair-like extensions on their ends and these hair-like extensions keep up a waving movement in the direction of the uterus which serves to propel the ovum slowly in that direction. The uterine ducts communicate with the horns of the uterus, there being two of the latter.



THE HORNS, or cornua, are simply continuations of the uterine body, only existing in a divided state. In other words, as one proceeds forward in the mare it is found that the uterus divides, forming two horns which later continue in the form of the uterine ducts to the ovaries.

The horns do not differ materially in structure from the uterus itself, being made up of muscular walls and lined with a mucous membrane.

THE UTERUS is a cylindrical body somewhat flattened and is located in the sublumbar region and projects backward into the constricted pelvic cavity. The rectum, or posterior bowel, lies above it, while the bladder and some of the intestines are found below. It is supported in position by several very strong ligaments and it is made up of strong muscular walls which, like the horns, are lined with a mucous membrane. These muscular walls become considerably thickened and strengthened during the process of gestation in order that they may properly support and provide the necessary structures for the developing foetus.

The uterus then communicates with the cornua anteriorly, while posteriorly it communicates with the vagina. The latter communication is by means of structures that are peculiar in their make-up. At this point the uterus is constricted, forming what is known as the neck (cervix) which latter projects into the anterior part of the vagina and in the virgin mare is quite conspicuous.

The opening through the cervix by means of which the uterus communicates with the vagina is called the mouth or os uteri. This mouth or opening is closed in the most of healthy mares when not in season and during the period of gestation is effectually closed and sealed with a gelatinous plug. The blood supply of this organ is from two chief sources (uterine and utero-ovarian arteries) and these vessels become very much enlarged during the period of gestation in order that a proper amount of

11. Meatus Urinae
12. Clitoris

Note:—Os Uteri, marked "6" in the drawing, is also known as the cervix or neck of the womb. Uterine Ducts, marked "3," formerly were known as the Fallopian tubes.

blood may be brought to the young foetus and its envelopes. The mucous membrane of the uterus is voluminous and inclined to be arranged in folds, which needs to be taken into account when forming a depression during the process of extracting the semen when practicing artificial insemination.

THE VAGINA is situated immediately back of the uterus, being underneath the rectum, and is within the pelvic cavity. It is composed of muscular fibres which extend both in a longitudinal and circular direction. The vagina then may be either shortened or constricted by muscular contractions. Its mucous membrane consists of flat cells arranged edge to edge, being known as the pavemental or squamous type. The vagina is the chief female organ of coition and communicates posteriorly with the vulva.

THE VULVA is the short entrance way to the vagina from the exterior. It is perhaps three or four inches in depth in the mare and has placed at its anterior termination a partial fringe or curtain which in the virgin mare usually is lacerated during the first copulation. This fringe, an irregular, half-moon shape structure, is attached to the wall at the junction of the vulva and vagina and it is known as the hymen. On the floor of the vulva at its anterior part may be found a transverse fold of mucous membrane which drops over the opening into the bladder and serves as a valve to prevent the ready entrance of material from the vagina into that organ. The opening into the bladder is termed the meatus urinae.

The external part of the vulva presents two vertical lips in the lower juncture of which is found a body called the clitoris. This body corresponds to the penis of the male and is capable of undergoing erection during sexual excitement. In those animals wherein sex is not clearly defined, that is, the animal partakes in a measure of the nature of both sexes (hermaphrodites), the clitoris frequently is found resembling a rudimentary penis. The external vulva drops forward in aged mares that have given birth to many colts on account of the continuous weight of the foetus dragging these parts forward and downward.

Having read carefully through this lesson, one or more times, the student should now ask himself the following questions and find the answers thereto from the text and the accompanying drawings:

1. Name the most important six female organs of generation in the mare?
2. Where does fertilization usually take place?
3. In what prominent characteristic does the female cell differ from the male cell?
4. Name one part of the genital tract that distinguishes a virgin mare from one that has been served.
5. What changes take place in the cervix during pregnancy?
6. What is extra uterine gestation?
7. What peculiarity is there in the structure of the mucous membranes of the uterus, which permits it to enlarge as the foetus grows?
8. How do these folds affect the extracting of semen from the uterus?
9. What changes do the membranes of the uterus and the supporting ligaments undergo during gestation?
10. How big is an ovum?
11. When an ovum is released what organs and parts does it pass in regular order before it finally reaches the outside?
12. Name all parts and organs mentioned in the foregoing lesson and locate them on the accompanying drawing.

Note:—In the next lesson (Lesson III), which comes in the American Breeder of May 5, we take up the purposes and activities of the organs and parts described in Lessons I and II.

Professor Barnes of Colorado Agricultural College says: "A horse should not be fed a large quantity of hay and grain without exercise. Many think that because a horse is thin in flesh no work should be required of him. It is always best to work the flesh into the animal rather than to fatten him as you would a steer."

Horse Breeding With Capsules

You have stated that in more than half of the services the semen is deposited in the uterus. I have a long, straight impregnator that I purchased with a company horse. Can that be used to get the semen out of the uterus?

REPLY—Your impregnator will have no value in capsule breeding—it will not bend. An instrument is required with a flexible point so that it may be bent down to the bottom of the uterus and straightened again before it is taken out. With a soft metallic point the semen can be taken from either horn of the uterus. The uterus is hung on ligaments so that it can be pushed forward two or three inches without any injury. The hand must be absolutely clean and the finger nails trimmed closely. If this work is done carefully there is no danger connected with it. The writer has made public breeding demonstrations in nearly half of the states in the Union, and in nearly every case enough semen has been taken from the uterus to breed from five to 22 mares at a service. When a clean, healthy, normal mare is served with a good serving stallion, the semen will usually be deposited into the uterus. There may be some of it deposited in the vagina also. In the average draft stallion about eight ounces of fluid will be found when the services are not too close together. The uterus is hung on ligaments so that during the act of copulation it is pushed back to meet the penis. The opening in the end of the penis should come in such a position that the discharge is injected into the uterus. The penis never enters the uterus under normal conditions. In getting the semen from the uterus it might be remembered that there are numerous wrinkles which serve to keep the semen from running to the lowest part of the uterus. In this case extend the finger quite well into the uterus; bend it down to the bottom and gradually pull the mucous membranes back, which will cause a depression running lengthwise of the uterus so that the fluid will not be obstructed and it may run to the end near the cervix where the point of the extractor will easily reach it.

Will it be necessary for me to have a real dark room to use the capsule system? Can it be successfully done in a shaded place?

REPLY—The semen should never come in contact with the direct rays of the sun. If the temperature is right capsules may be filled in a shaded place where it is clean. The only time there is any danger of the sun striking the spermatozoa is while it is being transferred from the extractor into the capsule. When it is in the capsule the hand should be closed about it so as to keep it away from the light, and keep it warm also. The light difficulty it not serious. Capsule breeding can be done almost anywhere with this precaution.

How full should a capsule be filled? What kind of capsules are necessary? Also where can they be purchased?

REPLY—The capsule should be filled only half full; keep the outside of the capsule dry. The Kansas City Impregnator Company has gone to a considerable expense in the way of making molds especially for breeding capsules. These capsules are made of the best quality and one end is pointed so that it is easily inserted into the womb. They can be purchased from the Kansas City Impregnator Company, Kansas City, Mo. This is the only firm that we know of which has the regular pointed breeding capsules.

Is it necessary to examine mares before they are bred with capsules?

REPLY—Mares should all be examined to see if there is a diseased condition present as well as to note the opening into the uterus. One should be familiar with the exact condition of the cervix before the capsule breeding is started. This also gives the operator an opportunity to select the best mare for the natural service, which should be the tallest mare that is otherwise all right, because the best services are usually made on these mares. She should be gentle so that it will not be difficult to get the semen from her. She should be clean and absolutely free from all diseases. The mares which are to be served with capsules should be located in an accessible position so that the operator could get from the breeding room to the mares with a capsule quickly. If there should be a team present, one of which might be a gelding, it is best not to separate them, as the mare will stand more quiet with her mate.

Can one man breed with capsules successfully, or is it necessary to employ an extra hand?

REPLY—If the owner of the establishment is in a position to use an extra hand it will be profitable to employ a man who will be present and qualified. Where a large number of mares are bred there is considerable work connected with it. The hired man may be employed at other work during the remainder of the time to good advantage. If it is not convenient to employ a regular man, arrangements might be made with one of the neighbors for a few minutes of his time when wanted. If this is not possible there are usually men that come to the barn when a large number of mares are to be bred. One of these men may be taught how to hold his finger over the semen extractor and keep it immersed in warm water; also fill the capsules at the proper time. He should be impressed with the necessity of paying particular attention to his business. Usually a good man can be selected from a number of men, who will be satisfactory. If the operator is to make the service and use the extractor also, he should have the water all prepared and the mares examined; then wash his hands with soap and water; rinse them with sterilized water and dry on a sterilized towel. He should have a number of pairs of white gloves (they can be purchased for 10 cents per pair); bring the stallion out and make the entrance; slip the gloves of quickly while the helper is handing the operator a bowl which has been sterilized, full of warm water at 100 degrees. Just before the stallion dismounts the water is thrown out of the bowl and if any semen is withdrawn it is caught in this bowl; then it is sucked into the extractor and put in warm water at 100 degrees. If no semen is withdrawn the helper should have an extractor full of warm water, which has been sterilized; as the stallion dismounts a bystander can hold the horse while the operator empties the water from the extractor and proceeds to get the semen.

Is it necessary to boil all the water used in capsule breeding?

REPLY—It is necessary to have all water sterilized by boiling so as not to carry any infection into the uterus of a mare. Everything used in capsule breeding should be clean. A number of towels should also be supplied so that a towel would be used only once, after which it is thrown into the wash rack. When capsules are to be used a clean towel should be spread out and the number of capsules to be used should be laid on this towel with the caps taken off so that they could be gotten quickly. If there is any doubt as to a mare being diseased she should either be refused or bred last, so as not to carry any infection to clean, healthy mares. We would advise rejecting diseased mares the first year while capsules are being introduced. Every mare that fails to produce a colt from a capsule would injure the reputation of the method just that much in that community.

Is the capsule system practical for the average stallion owner? We have a fine stallion that cannot do a third of the business in this community. Could we have any results with capsules by reading your paper?

REPLY—There are thousands of men using the capsule system as taught by the American Breeder. Most of these men have doubled their income without increasing the investment. If you will read the directions carefully you should have good results. There is a difference in men, however. The better per cent of foals a breeder can get with the natural service, ordinarily, the more colts he will get with the capsule system. We should advise every breeder that owns a good stallion or jack to study this proposition. If the breeders will get a few capsule colts in their communities, so that mare owners can see them, the rest of it is comparatively easy. One extra colt will pay all the expenses of preparing for capsules. There will be many times during the breeding season when you could breed a large number of mares on Saturdays and rainy days.

We have a fine stallion that we could make three stands a week with and reach a very large number of mares. Would it be possible for us to use the capsule system at these three stands?

REPLY—Many breeders are doing this successfully. One breeder has a large spring wagon; he drives an old blind horse to the wagon; this horse will stand anywhere at any time without being hitched. He is afraid to run away. He cross-ties the stallion behind and the stallion enjoys the exercise and is accustomed to that position, so that he is very little trouble on the road. With this spring wagon he can take plenty of feed and all of his breeding instruments; his oil stove and a container to boil water in. These stands are about six miles apart. He breeds every evening at 5 o'clock so that it gives him plenty of time to get to the next stand and make all preparations. He has notified all the mare owners throughout that country by postal card of the exact time for the service at each stand. This breeder does all the work himself except with the assistance of the mare owners in helping him with the breeding operations; any handy man can do this. This method of making several stands with one stallion should be studied closely. Several hundred mares can be bred to a good stallion by this plan.

In order to get our customers to use the capsule system I am thinking of making half price for capsule colts. What would you think of that plan?

REPLY—We would not advise you to make a cut price for capsules unless yon only wish to breed a few mares, and in that case make that exclusively with nine-day mares, so that the capsule system in your community will have a fair test. Too many breeders use capsules only on diseased mares. A great many men state that it is cheaper to use a capsule on a barren mare than it is to make a natural service. They do not seem to know that this will be injurious to the capsule system. It is better to refuse a mare that absolutely will not get in foal than to discredit the plan, as there are mares which will not get in foal without being treated. Occasionally a mare is beyond repair. These barren mares will be on hand at every opportunity and if the mare does not get with foal by the capsule system, it is frequently talked that the capsule system is not a success, even thought the mare may already have been bred for several years at each heat period to every horse in a community.

GOOD PLACE TO KEEP "HANDS OFF."

The Central Shorthorn Breeders' Association, with headquarters at Kansas City, has joined the thousands of other organizations and individuals interested in cattle production, in protesting against proposed legislation to prevent the slaughter of any cows and heifers. A letter to the American Breeder from this association's secretary, E. M. Hall of Carthage, Mo., encloses a copy of the resolutions to that effect, which were sent the Missouri legislature. It hardly seems possible that any legislative body would consider seriously such a law. If such laws were passed and could be enforced, it would not bring about increased beef production. Nothing which hampers a business or makes it less profitable will induce more people to engage in it, and such a law would do just that. Most of the slaughtering of cows and heifers nowadays simply rids the business of aged and non-productive cows and of heifers that are inferior or of a type not suited for increasing beef production, even though they were kept breeding.

This country (including a few fool papers and a lot of improvident city dwellers) should learn that one of the nation's greatest necessities is the maintenance of soil fertliity, and that the keeping of live stock on the land is the best means to that end. The very decreases in acre yields, which have been noted with alarm from some sections, are the results of decreasing the number of farm animals kept on the land. We are just now getting back to a condition where a farmer can keep every sort of live stock with profit—horses, cattle, hogs and sheep. The longer this condition lasts, the greater and more stable will become the nation's food supply.

Most legislators are too sensible to butt into this kind of a desirable condition, with a restriction like that against which the "Central" association is protesting.

PROGRESSIVE HORSE BREEDING.

In order to make a stallion or jack profitable it is necessary to get a large number of living foals. The old system of serving every mare that comes, regardless of conditions, is not very profitable.

The writer was engaged in the business of selling stallions and jacks for several years and gave this subject careful thought. The fact that a stallion or jack discharges such a large quantity of semen, only one living male cell of which can be used for a single foal, was convincing evidence that artificial breeding could be made successful. But finding a correct method was another question. Thousands of miles were covered in travel, investigating the different methods, and the principal difficulty was that the semen could not be found because it was discharged into the uterus. No method had ever been invented so far as the breeders knew, about getting the fluid out of the uterus. Breeders' bags were used but not very successfully. Many appliances had been tried.

The writer heard of the great results that G. L. Carlson was having. This breeder was visited; the mare owners were questioned and the colts were there to show. Mr. Carlson had solved the serious problem of getting the semen out of the uterus. The soft metallic point on the Carlson semen extractor which he used, and which will stand bending one thousand times before breaking, has done more for artificial breeding than all other appliances combined. More than half of the services deposit the semen in the uterus.

As soon as this discovery was made, it was announced in the Stallion and Jack News. Mr. Carlson was requested to write a series of articles on this subject. Then came a great demand for this instrument. The first ones manufactured were crude, but they have been much improved, after much money has been spent on investigation. If any breeder can show us better results from any other method, the writer will go across the continent to see it and learn about it, just as he has traveled and spent money to find out about other breeding subjects.

One individual, who is frequently spoken of an as unscrupulous dealer, has done more to injure artificial breeding than all others combined by selling a lot of worthless goods because they netted him a large profit. He has advocated the idea that any one could use his methods; that there was nothing to learn about it. He has tried to profit from the popularity of the Carlson semen extractor by using a cut like the Carlson semen extractor in his advertising. The extractor that he advertises has no value from a breeding standpoint because it will not get results and probably was intended to discredit this type of an extractor. The same individual is advertising the curved metal impregnator as an instrument with which to fill capsules. The curved metal impregnator has no value for such a purpose; only an unscrupulous dealer would make such a claim. Any intelligent man ought to know better. The curved metal impregnator is not satisfactory to get the semen out of the uterus because it is too stiff, it will not bend. The curved metal impregnator will not hold enough fluid to fill more than one or two capsules.

We are continuously being asked for information along these lines. Our conclusion is that the Carlson semen extractor is worth more to the horse breeders than all other breeding instruments combined. It now has a point protector so that the semen is more easily obtained. It has a new rubber plunger that can be made tighter or looser very easily. The suction can be easily regulated. All these improvements have been carefully tested.

We extend an invitation to all breeders to keep us posted on anything new along this line. The writer will be glad to investigate it. A method which has been successfully tried and found profitable is much better than an experiment. There are thousands of successful capsule breeders in this country now. More new capsule breeders will start this year than have been operating altogether, before. Go where you will, you can hear of some one who is producing a very large number of colts from a single stallion. Near Kansas City a breeder resides who has been using the system three years. This year he will collect about $2,500 in service fees from one stallion alone, for his last year's work. The remarkable thing about this is that he only charges $10 to insure colts to stand and suck and live for thirty days. The first year he started the capsule system his competitors caused him a lot of worry. He told them in plenty of time if they did not quit starting false reports and interfering with his business, that he would insure the colt to stand and suck for thirty days for a ten dollar bill. But they kept on fighting. The result of that skirmish is that there is not a stallion or jack standing within ten miles of this man's breeding barn. He makes one service each day. The mare owners know that they can get a service at the advertised hour any day in the week. On many occasions as many as fifteen mares are bred from a single service of the stallion. There is a good lesson in this.

Horse breeders who are able to breed ten or mares at a single service can make the price so cheap that the competitors must quit or adopt the capsule system. Any breeder with a little nerve can control the business in his community if he owns a good enough stallion or jack. A stallion can stand with the capsule system so cheap that the scrub horse will not have a chance. Too many breeders believe that if they adopt the capsule system that their competitors will drive them out of business. They may do a little damage in some ways but the advertising usually makes up in other directions. Any breeder can start the capsule system in a community very easily. Some breeders can do a big business the first year, but the average breeder had better be contented with breeding a few good mares that will get in foal so that there will be capsule colts that mare owners can see with their own eyes. Then it is easy.

The breeder, however, must be careful with his work and not make many failures. We would not advise breeders to experiment the first year. Neither is it profitable to breed diseased mares with the capsule system the first year. The object of breeding only good healthy mares with the capsule system the first year is to get every mare in foal that is bred so that a good percentage of foals can be talked about.

HOW SUBSCRIPTIONS ARE COMING IN.

We have already referred to the very gratifying manner in which renewals and new subscriptions are coming in—the biggest showing in the history of the paper. Last year, after having doubled the number of issues in a year, we continued the old subscription rate, giving all old subscribers a chance to renew at 50 cents. This meant a big loss, of course, and last December, in order to make the subscription department self-supporting—as it should be—the rate was raised, and we asked the co-operation of our readers to further extend the work of the American Breeder on the new basis. We printed samples of the first letters received—hearty promises and expressions of approval. Since then the letters have been coming by the thousands—many containing only renewals, of course, but a remarkably large proportion of them inclosing good lists of new subscribers at the new rate. Here is a typical letter of that class—and Texas is making one of the best showings of the eight or ten states from which we are hearing most liberally:

To the American Breeder:—I sent you ten subscriptions on the 22d of March and am sending you five more today. Could get more if I had the time to spare. Am sending my renewal with the others. My time will expire about the first of May; please continue it from that time.—J. S. Eddy, Mills County, Texas.

MARCH 20 ISSUE EXHAUSTED.

This notice is intended to save us writing nearly 1,000 letters. We have had requests for nearly that many extra copies of the American Breeder of March 20, since that issue was exhausted.

We provided nearly 10,000 extra copies of March 5 for February renewals that were slow coming in, but we figured that by March 20 most of the February expirations which would be renewed at all would be attended to. It seems we were mistaken. Renewals came in about as usual the first half of March. The last half they amounted to over three times as much as they did last year. We regret not having provided enough extra papers for these, but the best we can do now is to make this explanation. Prompt renewals would save us hundreds of dollars each spring, and we would gladly put this money into further betterments for the paper.

NAVEL ILL.

In some localities a great many colts die from navel ill. This complaint is much more serious than it used to be, and the serious thing about it is that it is very difficult to treat after the colt begins to show symptoms. Veterinarians, as a rule, would rather not have these cases because too many of them die. They can be cured occasionally by bacterine or serum, but these treatments cost a lot of money. The proper thing to do is to prevent navel ill. When a colt gets lame in one leg, or down in the back, or leaks water at the navel, or shows any of many other symptoms, too many mare owners do not know that these are caused from germs entering the navel. If the navel cord is properly cared for at foaling time these conditions would not exist.

Two years ago the American Breeder began a search for a prescription that would save these colts. One was found, and tried in many localities and found to be successful, but the difficulty was to get it filled at the average drug store. Others reported that it was too expensive, the cost being anywhere from $1 to $1.50 for filling this prescription. We know these colts ought to be saved; we know they can be saved, so the American Breeder purchased the drugs at wholesale prices and prepared this prescription. We had boxes made of suitable size with holes in the top like pepper boxes so that the powder can be dusted on the navel cord without any waste; neither will it cake or lose its strength. It is air tight. All that is necessary is to take the top packing out of the can by unscrewing the lid, screw the lid back on and it is ready for use. It is a good disinfectant; it will also keep the flies away.

When a colt is born, wash the hands and strip the navel cord down so as to get the fluid out. Dust this powder on the navel cord, which will cause it to dry up and shrink. We believe this is the best preparation for the navel cord known, but it must be used at foaling time; it will have no value after the colt is infected.

The price of the navel powder is 50 cents a can, sent by mail, postpaid. Many breeders are buying large numbers of these cans of navel powder and loaning them out to their customers. The powder is sprinkled on the navel cord two or three times a day until it is dried up; usually the second day the navel cord is dry and hard.

These cans can be loaned out and save a lot of colts. One colt would pay for a great many cans. One can should be enough for at least a dozen colts.

This paper only has two things for sale: navel powder and stallion service record books. We would not sell either of these if the right kind could be purchased elsewhere at a fair market value. Our readers appreciate our efforts in this direction. Below we print a sample of the letters received from our readers in this regard:

To the American Breeder:—Enclosed please find postoffice money order for $10 for which send me four stallion service books. Balance of order please send me drying powder for preventing navel ill, as I wish some of the powder for my customers.

Success to the American Breeder and its good work in the interest of the breeders (especially of the horse breeders) of this country.—A. B. Somers, Tama County, Iowa."

GRAHAM SCIENTIFIC BREEDING SCHOOL.

To the American Breeder: The Graham Scientific Breeding School of Kansas City, Mo., is one of the useful schools in America and yet it is not a veterinary college. No man who owns either mares or stallions can afford to miss the instructions imparted there.

The stallion owner learns to quickly detect diseased mares, which if bred would mean infection of the horse or jack, and a spreading of the disease to sound mares, causing them to fail to produce. Many a splendid mare has been bred during a whole season and failed when a simple home remedy would have quickly restored her fruitfulness. Many a fine stallion has died during the season with colic, whereas if his owner or groom had had proper knowledge the horse would have been relieved in a few minutes, his life saved, and that without medicine.

The capsule system of breeding is also taught, which is an absolute success and has come to stay. Properly manipulated, one service of the horse will breed six to ten mares and with better results than if the same mares were bred two each day by natural service. By the capsule system only one service per day is necessary, which saves the horse greatly and insures colts of stronger constitution, greater vitality, and more of them.

Thousands of colts die every year at from 3 to 8 days old. The owner generally contends the sire was at fault, when in reality the colt was foaled without disease and the fault laid entirely with the owner of the colt. A proper knowledge, and a few minutes' work, would have saved the colt in perfect health.

To stimulate men to greater purity and higher living, this school has no superior. Every man or boy who attends it goes home the better for having been there. Prof. Graham, who conducts it, as well as all of the eminent instructors, are Christian gentlemen of the highest type. During the term that I attended there was not a vulgar word spoken nor a lecture given but what was refining and elevating as well as very instructive.

It was near the close of the school that Prof. Graham appeared before the class and said, "If there is a man here who feels and believes that he has not got value received in this school for the tuition he has paid I want him to some right forward and get his money," at the same time holding up a handful of bills.

In that class of 130 there was not a taker, but words of praise and approval of the school came from every quarter of the room.

All were satisfied.

I surely recommend this school and close as I began:

"No man who owns either mares or stallions can afford to miss the instructions imparted there."—C. M. Lewelling, Farmers' Institute Lecturer, Beaver City, Nebraska.

BARREN MARES

How to Know Them, and How to Guard Against the Damage They Might Do to Other Mares. How to Treat and How to Breed Them.

Every mare should be examined more or less when presented for breeding. Those having colts from six to nine days old are usually good prospects unless they have not properly cleaned from the effects of giving birth. A mare not having a colt should be scrutinized carefully. Every breeder should be able to make a good guess at the age of horses. Breeding stock, you know, scarcely ever gets to be more than nine years old (according to statements usually made by some mare owners). Each year after mares are really 14 years old the per cent of foals they produce diminishes; only about one out of every 20 mares above 20 years of age, will produce a foal. There comes a time in the age of all mares when they will cease breeding. Some mares produce regularly until a very ripe age. Occasionally a mare will quit producing as early as 13 years of age.

A general survey of the condition of a mare should be taken. If the eyes or nostrils are discharging a watery fluid, it is evidence that the animal has a catarrhal condition, or at least a cold. There is not much chance to get a mare in foal at that particular time. She may be bred successfully a little later on—perhaps the next, or second heat period.

The mucous membranes should next be examined. This is done at the exterior openings; the eye, mouth, nostril, vulva and rectum. The eye lid should be turned up to see the condition of the mucous membranes. Unless a local disorder is present, these five openings should all show about the same condition. If normal they will be of a healthy, pale rose color. If they are severely streaked or very red, it is evidence that there is some inflammation present.

Inflammation of the membranes does not always indicate a diseased condition of the genital tract. It may be the result of a run-down condition and a bad cold, influenza or other minor troubles, all of which may pass off within a few weeks.

Importance of Temperature Tests.

Every breeder should have a clinical thermometer to take the temperature of mares. Rectal temperature, if normal, and the animal has not been exerting, should be about 100 degrees F. If the temperature is much higher than that, say one or two degrees higher, the chances are that the mare would not fertilize at that particular time. This may be caused by some minor condition that will pass off within a reasonable length of time. If the temperature is found normal in the rectum, then the temperature in the cervix should be taken, which should correspond with the rectal temperature. If the temperature in the uterus or cervix should be higher than that of the rectum it is evidence that there is some local disorder present in the uterus (womb). Mares may be severely diseased, however, and yet have a normal temperature, both in the rectum and uterus, but if a mare should be one degree, or higher, in the uterus than in the rectum, when the rectal temperature is normal, the chances are that she will not fertilize at that time. A normal mare may have a little rise of temperature during the heat period and yet be healthy.

Any physician or veterinarian should be glad to teach the breeder how to read a clinical thermometer. A thermometer for this purpose should be longer than that used by a physician so that it can be held easily and not slip into the uterus where it might be difficult to get again. After the temperature is taken it will be necessary to shake the thermometer down; it does not have a sliding mercury like that use in hot water thermometers. The thermometer should have a chain on it and in a case so that it can be pinned fast to the vest pocket and carried all the time.

The hairs under the tail coming in contact with the lower part of the vulva should be inspected. If the hairs are matted together it is evidence that there is some discharge; if there is much discharge it is usually from the uterus.

Look Inside the Mare.

Every breeder that expects to examine mares should have a speculum made of copper and nickel plated. This should have a straight barrel about 15 inches long, small at one end and large at the other so that the reflection will be directed to the cervix. With the right kind of a speculum a good survey of the cervix (neck of womb) can be had. If the cervix is streaked with blood, or very red, it is evidence that there is some disturbance in the womb. The speculum is best inserted by first putting the hand in the vagina, then pull it out about half way so that the small end of the speculum is inserted in the palm of the hand and gradually pushed on in with a screw motion. It should be done gently. A speculum is a very necessary instrument in diagnosing breeding conditions, as well as in surveying the cervix, to know whether a mare is pregnant or not. Many mares come in heat while pregnant and are opened, which results in an abortion. Mare owners should be requested to look into the speculum and see for themselves the exact condition; they should also have these things explained to them. After the speculum has been inserted the first thing is to notice the condition of the cervix; if that is closed with a mucous plug, do not open it under any circumstances for the mare is probably in foal. Do not touch the cervix if she is pregnant, as an abortion is liable to follow. If the cervix is not closed with a mucous plug, the hand should be washed thoroughly with soap and water and rinsed in sterilized water, and inserted into the mare; one finger should go into the cervix with the hand turned upside down, then gently push forward and down; if there is much pus in the uterus it will run into the hand. This pus may be either a very white color or of a yellowish cast. Neither of these discharges are considered dangerous, as a rule, in the way of carrying infection to other mares unless it is mixed with the barren mare germ. This, however, occurs quite frequently. If the discharge runs into the hand, pull it out and show it to the mare owner. There is very little chance of getting that mare in foal during the current breeding season if there is much pus in the uterus.

The uterus is a peculiar organ; the only way that material can escape from it is through the cervix and by absorption. It has a depth of from two to three inches ordinarily, but if it is filled with pus or other material, gravity may cause it to be much deeper, forming a basin for a considerable quantity of fluid. This is one of the reasons that the hand and everything inserted into the uterus should be absolutely clean. The uterus is one of the best germ nurseries known. Diseased germs of nearly any kind will thrive in this cavity. In our opinion many mares are made barren by the opening process in which the operator has failed to keep the hands clean. Disease germs thrive and multiply rapidly on its membranes causing a leathery condition of the uterus so that when the male and female cells unite, the fertilized ovum cannot become attached and passes to the exterior. But the great difficulty is that a condition may be present in the uterus that destroys the spermatozoa before conception takes place.

Good Test to Fix the Blame.

A very good test for students is to test with the microscope, the semen of a stallion by catching a few drops from the penis; then take a little semen from the uterus of a barren mare, and test it. This will convince any one that there is a condition present in certain mares that destroys the spermatozoa almost instantly.

The presence in mares of the recently discovered and unnamed germ which is known to cause barrenness in mares, is perhaps the most serious condition in horse breeding today. A stallion may serve one of these mares and carry that infection to other healthy mares as late as four days after such service. The penis of the stallion does not get sore and it is not injurious to the stallion, but does destroy the fertility of mares for some time to come. As a rule, they will not get in foal for several months and occasionally never. This is one of the hard things for the breeders to understand. Mares are like other animals in this respect, that some respond quickly to good care and treatment and others have such a strong constitution that they are not severely injured. But, as a rule, when these germs are introduced into the uterus, such a condition is present that, in our opinion, it is absolutely impossible to get many of them with foal.

Unless one has mares and subjects upon which to demonstrate, the symptoms in this disease are very hard to describe so that breeders can understand it, without making any serious mistakes. Our readers must understand that this is a new discovery and it takes time to investigate. While we have spent a fortune on these investigations we have received very little encouragement from any outside source. We have lost many subscribers and some friends by advocating these new things. We are trusting to the best judgment of intelligent men to give us all the assistance possible to offset the great loss we have sustained. If the breeders are interested enough in these investigations, a further study will be made and we will try to devise a means of describing these conditions so that the average breeder can understand it more thoroughly. We realize that with our scientific staff of investigators the American Breeder is printing a lot of information 25 years in advance of those of the horse fraternity who have done as their grandfathers taught them and are not willing to learn more. But we appreciate also the fact that we can depend on the co-operation of our large army of loyal friends who have made the American Breeder a success, and who are willing to learn.

This unnamed germ causing barrenness does not cause a large amount of pus or discharge, but is often associated with pus forming germs. The pus usually from this condition is

streaked with blood. The vagina and uterus usually contain a slimy material. The mouth of the womb is usually very open and greatly dilated (flabby); raised spots can usually be noticed in the vagina. The germ is usually found in mares that have had colts, but occasionally is found in a mare that has never delivered a foal. The vagina may be of a yellowish cast, but it cannot always be diagnosed from the vagina; it may be confined almost exclusively to the uterus. This is a hard condition for the average breeder to diagnose, inasmuch as some mares seem to be in perfect health and in good condition, even though they have had this disease a considerable length of time

Fertilization may take place in a mare carrying this germ, but should the uterus be severely inflamed it will not attach to the walls of the uterus after it has descended that far, and may be expelled to the exterior and lost. The great difficulty with mares affected with the germ called "barrenness in mares" is that the uterine ducts frequently are involved, in chronic cases, to the extent that they are closed. When the uterine ducts (fallopian tubes) are closed there is no chance of the mare getting in foal.

Not Best to Be Too Sure.

We wish to caution our readers not to reject any and all mares too rapidly, but to study this subject carefully; state to the mare owner that in their opinion a certain mare has a particular condition. It is easy for one to lose his reputation or have the customers lose confidence in one's ability by being too rash with statements, more especially in a new condition that even an average good veterinarian is not familiar with.

Horse breeding is a subject that has not been studied much by the average mare owner. If a mare has ever delivered a foal, many of them contend that she should do so regularly, regardless of any condition, and that the stallion is a failure if the mare does not fertilize. Some may have difficulty in rejecting these mares. A good method of doing this is to explain the situation to the owner of one of these animals. Make him the proposition that if he will breed his other good, clean, healthy mares during the four days following this service on the diseased mare, his mare will be served. Explain to him the danger that he takes with his mares. This usually makes any intelligent man think. Ask him if he is willing to infect a stallion that will be used on his neighbor's mares. If he is not familiar with infection ask him if some of the social diseases can be transmitted through the act of copulation.

Usually we advise all delicate cases, such as treating barren mares, to be done under the supervision of a veterinarian who has attended a recognized veterinary college, where they have had an opportunity to thoroughly understand the anatomical structures and the nature of strong medicines, as well as of infection. But the subject of treating barren mares is new to the mare owners. The custom has been to breed them over and over again, regardless of conditions. This custom is so well established that owners of mares will not go to a veterinarian or at least they will not pay for it. Hundreds of our readers have written that they could not get their mare owners to patronize their veterinarian for this purpose. We have always advised the stallion owner and the veterinarian to work together—they can be of much service to each other.

There is, however, another difficulty. This same custom of breeding mares over and over again has not encouraged the veterinarians to study the treating of barren mares from a producing standpoint. Their practice has been to cure, which frequently leaves the generative tract in a hopeless condition so far as reproduction is concerned.

Some changes must be brought about in this direction. If the qualified men cannot perform this service, others must do the best they can. Some class of men must do this work. The per cent of foals is entirely too low. The method of insuring the colt to stand and suck in this country, and the high price of horses, is causing every mare to be bred over and over again regardless of diseased conditions. When only one mare out of each three bred produces a colt old enough to wean, something must be done. We would advise every breeder to get on friendly terms with a graduate veterinarian who will treat mares from a producing standpoint, and cooperate with him when possible. If this cannot be done we urge every breeder to take steps to do the work himself. The successful breeder and the qualified veterinarian should be the best of friends and work in harmony in the interest of more and better horses.

Cases Where Capsules Help.

About 40 per cent of the shy breeding mares can be made producers by the use of the capsule system. Nervous mares should be bred with capsules and not teased very much. This is especially true of mares with young colts. The best possible results can be had with nine day mares by breding them from the sixth to the ninth day, with a capsule, and without teasing them. Mares that have had difficulty at a previous foaling time, which has resulted in a closed cervix, can only be benefited, as a rule, by artificial assistance, and the capsule system is the only successful method. There is another class of mares, those having a large open cervix, but not diseased, that can be fertilized two days after the heat period has closed by breeding with the capsule. There seems to be a condition during heat that causes these muscles to greatly relax, but as the heat period closes, the cervix will have a much firmer appearance. Some mares are greatly excited during the act of service. During the straining process, the fluid does not seem to enter the uterus, but is promptly expelled. A capsule inserted quietly into one of these mares is not easily thrown out; the gelatine capsule dissolves and much better results follow. A mare may have had difficulty at foaling which results in having the neck of the womb twisted or thrown out of line, so that when the service is made the discharge is made entirely in the vagina. A very small per cent of these mares will ever get in foal with the natural service. Very large stallions used on small mares are liable to have the same results because the penis is not in line with the neck of the womb. Stallions having a very large penis give practically the same results, even on good sized mares. There is less danger of injury to the animals, also less danger of carrying infection from one mare to the other with the capsule method of breeding than with the natural service. It is only a question of time until the method of horse breeding with capsules will become general throughout the country.

Before a mare is treated, a thorough understanding should be had with the owner of the mare as to his action in the case. If he expects this mare to get in foal immediately, do not treat her. In fact, it is not advisable to treat any mares for the public unless the owners will agree to bring the mares back for regular treatment and at specified times for rebreeding. This does not only apply to this season only, but to the following season. There are some mares that will not get in foal this season, even though they are treated, as it requires time in some cases. A breeder may work faithfully through an entire season on a mare and get her ready to be bred the following spring, then the mare owner gets disgusted and takes her to another stallion, which might get her in foal at the first service. This would not be justice to the individual who has spent a lot of time helping his competitor. If the mare owner is not willing to make this concession, do not treat his mare. The individual who is capable of managing his own business, in other words, being the proprietor, will take a step in the right direction.

Guard Against Acid Conditions.

There is a class of mares which have an acid condition in the vagina and the uterus. If found in the uterus to any great extent it will probably extend into the vagina. This is very easily detected. A piece of blue litmus paper can be inserted into the cervix; if it turns red, the mare is acid—a condition which would destroy the spermatozoa. The change in color may not be very great. If there is no change it is an alkaline condition, which is satisfactory. There are three safe and proven treatments, some one (or two) of which often effect cures in such cases. They are known as the "iodine," the "saline" and the "soda" treatments.

Every breeder who owns a stallion or a jack of any kind, and who makes any pretention as a breeder, should have a vessel holding several gallons of water, with a lid on it and a faucet with a cut-off valve so that the water can be boiled in this container and allowed to cool. This is necessary every time a mare is opened up, as well as for other purposes. All of the water used in treating barren mares should be sterilized by boiling, otherwise the treatment might be worse than the original ailment.

The additional appliances for giving mares either of these treatments are—a hose made of good rubber about three-eights of an inch in diameter and from five to eight feet long (ordinarily five feet is enough); a funnel to fit the hose, and a large cup holding one gallon of water. The water used in flushing out mares should be about 110 degrees as it will cool a little in passing through the rubber tube. No water should ever be used in a mare at less than 100 degrees.

The iodine treatment is prepared as follows: A teaspoonful of tincture of iodine to a gallon of sterilized water, or strong enough to give it a bright red or port wine appearance. The saline solution is made by putting a teaspoon level full of good salt in a pint of sterilized water and boiling together. The soda treatment is made by putting a teaspoonful of soda in a quart of sterilized water. (Soda purchased at the grocery store is suitable.)

Before the uterus is flushed out, the hose, funnel and gallon cup, should be put in the retainer and boiled in order to destroy all infection. This should be done before each treatment so as not to carry any infection from one mare to the other. The hands should be washed; finger nails trimmed. A helper should be instructed to pour the fluid in the funnel, holding the fluid well up so as to give the desired pressure. After the hose is filled with fluid the end of the hose should be bent so as to make a cut-off and not allow air to be injected into the womb. A gallon of fluid should be prepared at the proper temperature for each case. Insert one finger into the uterus over the front end of the hose and let the fluid flow into the uterus. Fill it full, but in case the uterus should be unduly large, and one gallon is not enough to fill it, siphon the fluid out before the hose is empty by lowering the outside end of the hose, keeping the finger over the point of the hose to keep the membranes from clogging it. In the event that only the vagina is involved, it alone should be irrigated, but this is not often found. Only veterinarians should flush the uterus of a mare that has recently aborted, as there is danger of getting too much air in the uterus at that particular time. Breeders should not attempt to treat these mares sooner than ten days after an abortion.

You Need This Stewart Ball Bearing Machine

to clip your horses before the spring work begins. Insist on having the Stewart, the machine which turns easier, clips faster and stays sharp longer than any other. Gears are all file hard and cut from solid steel bar. They are enclosed, protected and run in oil; little friction, little wear. Has six feet of new style, easy running flexible shaft and the celebrated Stewart single tension clipping head, highest grade. PRICE $7.50 Get one from your dealer or send $2 and we will ship C. O. D. for balance.

A Great Horse Story
KATE and QUEEN
By Prof. Jesse Beery

Surpasses the famous "Black Beauty" "Kate" a victim of poor handling is vividly contrast-with "Queen" who was more fortunate. You sympathize with one—rejoice with the other. Prof. Beery has woven into this intensely interesting story, many valuable suggestions for handling horses—a result of a lifetime's experience. Thousands praise it. Sells for 50c, but a limited number only will be sent for the names and addresses of 5 horse owners and 10c to cover postage and pack'g.

FREE With each book we also send FREE a beautiful colored picture of Queen—oil painting effect—suitable for framing. Send today.

When the iodine treatment is used it should all be siphoned out, because enough of it might be absorbed into the system to be injurious. If there is difficulty in getting it out it might be well to use a gallon of the saline solution to wash it out. Ordinarily it will flow out of the uterus by inserting one finger and pushing down a little so as to form an outlet. It is not so important to have all of the saline or the soda solution siphoned out; neither of these will do serious damage except in a very large organ that holds an undue amount of fluid. The operator must use some judgment as to what treatment will be best for each individual case. Ordinarily in a bad case the iodine treatment should be given once a week for two or three weeks.

Be Careful With Iodine.

Where the iodine treatment is given one should not expect a mare to fertilize for several weeks afterward, as it serves to remove the diseased covering in the uterus, after which a reasonable length of time will be necessary to form healthy tissues.

Mares having a bad case of infection with the germ called "barrenness in mares" should receive several treatments of iodine, and every breeder should arrange for a fall breeding season so as to have an opportunity to get these mares in foal during the fall months after they have had time to heal.

Mares having only an acid condition can usually be put in good shape in a very short time. If the litmus paper should be strongly colored it might be necessary to give two treatments, but when it is only slightly colored the mare may receive the soda treatment and be bred within a few hours afterward. But it is usually better with most of these cases that have much acid to first give them the saline treatment, which serves to remove the cause, then in a week or two use the soda, after which they may be bred.

There is perhaps no single treatment that will give the breeders as good results on the average shy breeding mare, as the saline solution. The salt and heat are both stimulating to these parts. There are a lot of mares that can be treated twice a week for two or three weeks very successfully. This treatment seems to increase the blood supply; it brings new life; it makes all the organs active. This is especially good in old mares. We predict that the time will come when the saline solution will be used at every breeding barn. It is very easy to use; practically no danger connected with it whatever. The uterus of the ordinary mare can be filled with this without any attempt to siphon it out. In fact, it would be a very good plan with some mares to fill the uterus full, then place the fist against the cervix and push forward and back a few times so that the mare will strain a little and in this way thoroughly flush all the parts of the uterus. If she does not expel it soon place one finger in the uterus and push down slightly. This will usually remove most of the fluid.

The time has come when every breeder that expects to stay in the business must pay more attention to his mares. These treatments will not help mares having diseased ovaries, large kidneys and such other conditions beyond the reach of the ordinary breeder. There are numerous conditions to diagnose which it is necessary to make rectal examinations. We would not advise the ordinary breeder to do this without having some special instructions. There are many problems connected with the breeding business, and we feel that the breeders are only beginning to master them. We hope the time will come when breeders can make a diagnosis of a mare and tell the exact ailment. We have tried to make this article as plain as could be with printer's ink and plain language, so that breeders could understand it. Frequent reference should be made to the second lesson in the American Breeder School. We will be glad to have our readers ask further questions on the subject of "Barren Mares."

Stallion Service Record Book for Two Hundred Mares—The latest and best on the market, as cheap as the cheapest. It is a handy pocket size, with 224 pages of strong bond paper and a waterproof cover. It has a calendar, a gestation table and an index of twenty pages so that each mare can be found easily. Each mare has an entire page. This book can be used for several sires without carrying more than one at a time. Notice how easily it is to record the breeding of a mare and give the details. This record book is the result of the opinions of many breeders. It has no worthless advertisements in it. If you are not satisfied with it, return it and get your money, which will be cheerfully and promptly refunded to you. Price 50c each, postage prepaid. Published by

THE AMERICAN BREEDER
225 WEST 12TH STREET
KANSAS CITY -:- MISSOURI

WHERE A LITTLE REFLECTION HELPS.

To the American Breeder: I see several ways recommended to make a slow jack cover. One of my neighbors told me a new one. He said he had a jack that the only way he ever got him to cover was to hold a looking glass in front of him so he could see himself, and he would always make the service.—Wyatt Carr, Story County, Iowa.

NEW STALLION LAW IN IDAHO.

To the American Breeder:—Find inclosed copy of our stallion law, as amended during the last session of the Legislature. I could not get the Live Stock Sanitary Board to recommend the Arkansas law as a whole, so did the best we could. I think this will help some.—Frank N. Taylor, Secretary Boise Valley Stallion and Jack Owners' Association.

"The owner of any stallion or jack standing for public service or taking compensation for same or offering for sale, trade or to part with in any manner in the State of Idaho, shall post and keep affixed during the entire breeding season, or while he is for sale, copies of the license certificate issued under the provisions of this Act, in a conspicuous place on the main door leading into every stable or public building where said stallion or jack is kept for public service or sale, in the State of Idaho. Said copy shall be printed in bold-faced and conspicuous type, not small—especially the words "pure bred" or "grade", and unsoundness noted.

"All license certificates for stallions and jacks issued under this Act shall be presented to, and recorded by, the recorder of deeds of the county or counties in which such stallion or jack is used for public service or offered for sale.

"The owner or owners of any sire receiving such certificate shall have a lien upon the mare served by such stallion or jack, and upon the offspring of mare served by such sire, for a period of eighteen months from the date of birth of the get, and said lien shall have priority over all other liens and encumbrances upon the get of any such mare; provided, that said owner or owners shall, within twenty months of the time of rendition of such service by said certified sire, file for record a statement of account, properly verified with the Auditor of the County wherein the service has been rendered, and of the amount due such owner or owners for said service, together with a description of the female served; provided further, also upon the sale, exchange, removal or disposition of such female without consent of person holding the lien or with intent to defraud him, the owner of such female animal shall be guilty of a misdemeanor and upon conviction thereof shall be fined in any sum not more than fifty dollars ($50.00).

"All Acts or parts of Acts in conflict with this Act are hereby repealed. An emergency existing therefor, this Act shall take effect and be in full force from and after its passage and approval.

(Signed by the governor, March 12, 1913.)

Form for Stallion and Jack Folder

To the American Breeder: I intend having some folders printed to advertise my horses and jack. Thought possibly I could get you to write up this ad for me, telling the advantages of breeding where the stallioner is a graduate in scientific breeding. If you will write this ad for me, please do so as soon as convenient, sending with it your charges for the work, and oblige.—J. J. Ernst, Davis County, Ia.

As a partial answer to the above request we submit the form below, from which Mr. Ernst and others may get some ideas worth using. We doubt if this will exactly meet the needs of any breeder and no breeder should be content to simply copy a form. Study this over and then trim it down, add to it, and change it to meet your special requirements.—Editor.

DO YOU WANT COLTS?

Sired By the Best Breeding Stock and Secured at the Least Risk and Without Needless Loss of Time?

IF YOU DO

BREED YOUR MARES

To Your Choice of the Following Animals

(Insert here description of stock, and terms.)

WHY?

1. Because I give you the benefit of up-to-date breeding methods that have cost me time and money to learn, and that are now indorsed and practiced by hundreds of the most successful breeders in this country.
2. Because I can tell you if your own mares are in the best condition to breed, and in case one should happen not to be just right, may be able to show you a treatment that will clean her up.
3. Because I protect your healthy mares from possible infection from any diseased mare that might come to my barn.
4. Because I have the best possible means of settling mares that are difficult to get in foal.
5. Because I can conserve the energies of my breeding stock, and impregnate your mares with stronger semen, as a result.
6. Because I use a microscope on the semen and know that it is good.
7. Because my arrangement means a big saving of time to you.
8. Because I have the stock.

(Name and address of owner, location and time of stand, etc.)

Breeding Stock Public Sales

Review of Representative Events—Healthy Condition of the Producers Business Indicated—Late Horse Sales Best—Stronger Cattle and Hog Prices.

The season's public sales of breeding stock afford one of the best indications of the improved conditions which live stock breeders almost everywhere are enjoying. While we have had several years of good demand at strong prices for registered draft horses and for jack stock, and good work horses generally, the cattle breeders with the exception of those breeding dairy cattle, have seen some hard times. Breeders of pure bred hogs have suffered more or less from hog cholera, both directly and indirectly, and where they have had no actual losses the nearness of hog cholera has, in seasons past, often interfered with the selling of their surplus. In every line there has been an apparent change for the better.

Since the beginning of the new year draft horse demand has improved and the latest sales of registered draft stallions and mares have been the best. The demand from farmers and from all industries has not only made the horse market good at this busy time, but operated to offset nearly all of the midwinter dull period. The same sort of demand is reflected in both public and private trade in jack stock, which stays strong as long as the mule business is good, and that apparently is going to be forever.

Good Times for Cattle Breeders.

Owners of good beef breeding cattle are now in the best of spirits in the certainty that their live stock is worth more than it has been at any time in the past ten years. As the result of an early campaign for making the best possible showing at the stock yards and the other points of ultimate demand, the Hereford cattle men have enjoyed the first marked advance in breeding stock. All recent sales of Hereford cattle have been good, and some have been nothing short of remarkable. The highest of these was the sale of Warren McCray in Indiana, at which approximately $40,000 was received for seventy-six head of high-class bulls and females. This means an average of $525 for the lot. The highest price paid in the sale was $2,500, and it is very seldom that a sale with a top no higher has made so good an average. The McCray offering included a number of show cattle and represented a much larger investment per head than goes into most public sales.

Perhaps more nearly representative of conditions generally in the Hereford cattle business (although these cattle, too, were good ones) was the sale held by various breeders at Grand Island, Neb., in which an average of over $220 was made on an offering of 115 head.

Another combination sale held at Kansas City showed practically the same results; an average of nearly $250 per head being realized on 85 cattle, two-thirds of which were bulls. This sale is a regular annual avent at Kansas City and the offering is usually made strong in bulls with a result that Western bull buyers are attracted. In this case 57 bulls averaged $275.

A series of Shorthorn sales of importance comparable with the highest Hereford sales is just beginning and must be reported in a later issue. A good illustration of the demand for this breed throughout the West is found, however, in a recent sale held at Salina, Kas., in which a severe storm prevailing at the time prevented selling all of the offering. As it was, however, nearly $10,000 was realized on the 65 head sold, and the demand for bulls and females of any age seemed to come from all classes.

From these prices cattle sales have ranged down to figures which represent simply good farm profits on the investment and cost of raising the animals that were sold. Next to the Shorthorns, Polled Durhams, Angus and Galloways all apparently enjoyed a good demand.

Hogs High on Insistent Demand.

The conditions for hog breeders are so much improved that a great many sales of pure bred sows and gilts, bred for spring farrow, have averaged in the neighborhood of $50. In fact, averages from $40 to $60 have prevailed in the sales of those breeders with sufficient prominence to do any general advertising. A few of the most notable sales have made averages above $100, and in this class of prices Poland China, Duroc Jersey and Berkshire offerings have all been found. Under some conditions these prices might be called extreme, but so general has become the scarcity of breeding hogs of any sort that prices have been forced to where they are by a legitimate and insistent demand.

We will mention only one sale as typical of the trade in the best class of breeding stock; this is the sale of W. B. Wallace of Bunceton, Mo., which was advertised in the American Breeder. Local conditions were not favorable at the time but the reputation of the herd and widespread demand for the best animals, resulted in the selling of over 80 head for in the neighborhood of $4,500, a large proportion of the animals sold being shipped out of the county and some of them shipped out of the state. Had the usual home demand been experienced over $1,000 would have been added to the total.

HORSE AND JACK STOCK SALES IN PARAGRAPHS.

A sale of Percheron stallions and mares held by J. C. Robison of Towanda, Kas., and W. R. Brown of Minneapolis, Kas., at the Kansas City Stock Yards, made an average of about $550, and both principals to the sale were well pleased. The prices were very uniform, some of the highest priced animals being perhaps the best bargains. The highest price paid was $1,005 and from this figure prices ranged down to $210 for an eight months filly colt. Several yearling stallions were sold and brought from $300 to $700—prices which mark them as the most profitable live stock a farmer can raise.

In the recent sale of horses at Beloit, Kas., the highest price was paid for the Percheron stallion, Rowdy Boy, bred (and shown at several fairs last fall) by J. G. Arbuthnot. The sale of this Kansas bred horse at $1,100 to F. T. Brown of Sylvan Grove, Kas., is encouraging to many others in the business. In this sale the contributors secured an average of over $400 for everything put up. The 20 Percheron stallions included in the offering averaged nearly $4[illegible] and many of these animals were only two-year-olds. A few light horses contributed (and included in the general average given above) sold from $135 to $350.

One of the highest draft horse sales of the year was made by W. H. Bayless-DeRo & Co. of Blue Mound, Kas. A small offering, mostly Belgians, sold for an average of $870, although some were home bred yearling fillies. Most of the Belgian stallions were imported. One brought $2,000; one, $1,720; one, $1,600, and the balance below $1,000.

The Monsees jack and jennet sale totaled over $30,000 for 60 head of stock. The 35 jacks brought nearly $23,200, or about $663 per head average. The highest price paid was $1,540 for a three-year-old jack, George Finley, Nelson, Mo., being the buyer. Six other jacks sold in prices of four figures, Illinois, Kansas and Missouri each taking two.

The jacks sold at auction by W. T. Trotter, Mt. Ayr, Ia., averaged over $660, the top price paid being $1,000. D. J. Huchins of Sterling, Kas., was the buyer. Bad weather kept buyers away and interfered with the sale, but even at that it was a profitable sale.

In the sale of Percheron stallions and mares and of jacks and jennets held by S. J. Miller of Kirksville, Mo., $15,000 was paid for 39 animals. The highest price paid for a Percheron was $890, but two jacks sold for $1,550 and $1,300, respectively. While the offering was not a large one, it had sufficient merit to attract good buyers and the results were very satisfactory.

A small Illinois sale of Percherons made early in the season, in which

"CONQUEROR" STALLION BRIDLE

GUARANTEED TO HOLD ANY STALLION OR JACK.

This bridle is made of especially selected material, absolutely the best on the market.

Can be adjusted to fit any size head and for either hard or tender mouths.

Just the thing for breaking runaways or kickers.

Never tie an animal with this bridle. If he got to pulling he could split his head.

We prepay the postage or express charges and sell these bridles at **$2.50 each.**

KANSAS CITY IMPREGNATOR CO.,

12th & Central Sts., Kansas City, Mo.

Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

N. B.—When we started this ad a year ago the American Breeder required us to deposit $500 with them, to insure the protection of every subscriber who bought **"Jacksorine."** We have sold several hundred boxes, and only 8 buyers failed to work a cure. These got their money back.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in a substantial box and sent promptly by mail. It is a paste and applied with a small brush three times a day.

Send money by bank draft or P. O. money order. Price $5.00.

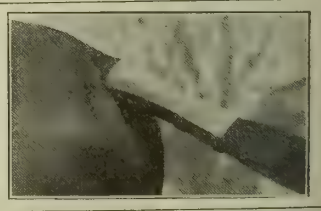
O. P. WILSON & CO., 3754 Wayne Avenue, Kansas City, Mo.

Stannard's Processed Crude Oil

THE BEST DIP MADE

for killing lice and curing mange. One application will do more to kill lice and cure mange than three applications of any other dip made (it destroys the nits). . .....$5.00 for 52 gal. bbl

I also carry a full line of lubricating oils.



I will pay $1.25 each for my crude oil barrels; $1.50 each for my refined oil barrels, returned to me at Coffeyville, Kas., in good order, less freight charges on same.

C. A. STANNARD, BOX A, EMPORIA, KANSAS.

TAIL HOLDER. (PATENTED.)

Most satisfactory and sanitary way of holding a mare's tail while breeding. These **"Tail Holders"** are a proven success. Every owner will appreciate your fixing his mare in good shape to breed. You haven't time to fool with a filthy string, which is a poor method anyhow. You can put on and take off this **"Holder"** in an instant. Send for one and if it is not as represented return it and get your money back. Price, 50 cents, postpaid, stamps or M. O.

E. E. HALL, Kincaid, Anderson County, Kas.

Don't Have a Blind One

If Your Horse Has Eye Troubles Use "VISIO"

The acknowledged standard veterinary eye remedy—$2.00 per bottle postpaid on receipt of price. VISIO REMEDY ASSN., 2475 Calumet Ave., Chicago, Ill.

one horse sold for $1,225, made a general average of $440, most of this stock having been raised on the farm of the man who sold it.

A February public sale of Shire horses held in Iowa made an average of $517. Most of this stock had likewise been bred on the farm where it was sold. Yearling colts sold from $170 to $375.

In the Pabst Stock Farm sale of Percherons, the stallions (mostly two-year-olds and yearlings) averaged close to $500, the highest price being $765. A small consignment of stallions running slightly older, made by J. G. Boyd, averaged about $600. The mares and fillies averaged about $375, the list of buyers including some well posted and discriminating breeders.

Reports of the Percheron sale of C. W. Lamer & Co. at Salina, Kas., show an average of about $640 on the 24 head sold, which includes four 4-figure prices on stallions, viz., $1,850, $1,650, $1,000 and $1,175. These tops went to Kansas and Oklahoma breeders.

NORTH & ROBINSON COMPANY'S GOOD SALE.

The North & Robinson sale of registered draft stallions and mares held at Grand Island, Neb., on the 20th and 21st of March was one of the best sales of pure bred horses ever held in Nebraska. The quality of the offering was good and the buyers showed their appreciation of the offering by bidding liberally. Bonavita topped the sale of Percheron mares for $1,560, and went to C. H. Zachry of Merna, Neb. The imported Belgian stallion, Barnum 4978 (38646), sold for $1,500, going to Chas. Grammer, Palmer, Neb.

The offering and prices realized proved beyond a doubt that good horses can be raised in Nebraska and good prices obtained for them.

Following is the list of sales:

Percheron Stallions.

Adelbert 80959, 2 years old, $1,310—Zikmund & Novotny, Ord, Neb.

Louise N. 13706, 1, $200—Matt Dugan, Greeley Center, Neb.

COULD NOT AFFORD TO BE WITHOUT IT.

To the American Breeder: As I have been putting off from time to time the renewal of my subscription you will find enclosed $2, for which please mark my subscription up for three years. I could not afford to be without the American Breeder for twice that amount. I consider it an ideal paper for a breeder and stock grower. I have been greatly benefited by reading it since I subscribed one year ago. It is a great help to me in my business as an auctioneer, for it argues the subject on all class of stock.—A. U. Rhodes, Logan County, Oklahoma.

CAPSULE SYSTEM MAKES MARKET FOR A CHAMPION STALLION.

Again the opportunities which the "Capsule System" has opened up to breeders and importers of high class horses have been strikingly illustrated in the sale of a champion stallion. Mon Gros 5937 (64986), for two years the champion Belgian stallion of the International Live Stock Show, has been sold by Messrs. J. Crouch & Son, LaFayette, Ind., to Mr. M. A. McMahan of Jerseyville, Ill.

Mr. McMahan has made a study of modern breeding methods and made a business success applying them to the breeding of valuable horses.

Through the use of capsules he was able to greatly increase the number of foals produced by his stallions, and the fact that he did this, and that his customers throughout the community have a fine lot of "capsule colts" to show, has created a demand among the best class of mare owners for this method. It saved their time and enabled Mr. McMahan to keep his breeding stock in better condition than ever before—an advantage to everybody—beside making regular producers of some excellent mares that had been shy breeders. He was quick to see that the "capsule system" made it possible for him to buy and use a much better animal than would otherwise be practical. After preparing himself to make the most of such a purchase, he started out to find the horse. That his aim was for the very best is shown by his selection of Mon Gros.

And here again is illustrated an important advantage which breeders have who make the most of the capsule system, for Mr. McMahan not only bought Mon Gros, but the service of a champion stallion being thus assured, he was in position to buy a Belgian mare of equal excellence, which he did in the purchase of the Illinois, Indiana and International champion, Betsy de Voorde 2358.

Concerning Mr. McMahan's purchase of these famous horses Messrs Crouch wrote the American Breeder as follows:

'For one man to make up his mind to buy two such famous animals at the same time means faith and courage in his undertaking, and at the same time a keen perception of the demands of the times for better horses, and an understanding that a mere difference in price cuts little figure, when a man wants to breed horses that are as good as can be found any place in the world.

Mr. McMahan will make the season at his farm with this great stallion Mon Gros, and his mare, Betsy de Voorde, he hopes to see the mother of many good pure bred Belgian colts. He will be glad to have his friends and neighbors, many of whom have seen these animals at these shows before, call and see them in their new home.

STATEMENT OF OWNERSHIP AND MANAGEMENT

of the American Breeder, published twice monthly at Kansas City, Mo., required by the Act of August 24, 1812.

Editor, Frank B. Graham, Kansas City, Mo.

Managing Editor, Frank B. Graham, Kansas City, Mo.

ADVERTISING BRIEFS.

The writer has talked with many stock men and farmers from different parts of the United States who owned Canadian land and are farming it. They bought the land primarily because it was a bargain as a farming proposition. But all of them soon learned that there was more to the Canadian proposition than mere land values. It is a fact which Americans have to admit with regret that for favorable laws and opportunities generally, the Canadian government gives the farmers a much better opportunity than our own government does. The Canadian Pacific Railroad will furnish you special information on this point, or, in fact, on any point you may desire to investigate. Address K. T. Thornton, Colonization Agent, 112 West Adams street, Chicago, Ill., for any information you may desire, and mention the American Breeder.

Even with this year's low priced feeds one concern at least has demonstrated that it has food products which stock men can use to advantage. Attention was especially attracted to this fact last fall by the presence of many winning steers which had been fed on Champion Feed manufactured by the Champion Feed Company of Tarkio, Mo. These people sel la real, not a condiment, and not a cheap filler sold at a high price. If you want a lot of good information on the subject read their advertisement in the American Breeder and write them.

The ponies are with us again—the famous ponies, brothers and cousins of those which have been offered before to the readers of the American Breeder by the big farm women's paper of St. Paul, Minn., The Farmer's Wife. All over this country there are children now owning and enjoying Shetland ponies which they have gotten by securing subscriptions to this paper. Read the advertisement on the back cover.

The Barbee Stock Farm of Monticello, Ark., are advertising 21 high class stallions for sale—saddlers, trotters and Shetland ponies. Don't fail to read their ad if you are in the market.

Any one having a match team of Morgan mares should not fail to write to W. A. Speer, Buckingham, Iowa. He is in the market for such a team.

A great many horse breeders as well as other stock men and farmers, are buying the crushed oats machine advertised by W. H. Bellows, 97 Warren street, New York City.

Right now before you turn your stock out to grass it will pay you to see that the older ones, especially, are free from the profit eating stomach and intestinal worms. Unless you do this you can depend upon it that your young lambs calves pigs and colts will become badly infested with these pests as soon as you turn them out to pasture. The older animals have been harboring these parasites all through the winter months and millions of the tiny larvae will be de-

posited in your pasture fields along with the droppings. Here the worms will hatch out and crawl to the top of the grass blades where they are sure to be taken directly into the stomach along with the food and thus infest every animal. The simplest and surest way of ridding your stock of worms is to let them run freely to "Sal Vet," the well known medicated salt, prepared by the S. R. Feil Co., Cleveland, Ohio, and advertised in this issue. All you need to do is to fill out the coupon telling him how many head of stock you have and send it at once to Mr. Sidney R. Feil, Pres., The S. R. Feil Co., Dept. A.B., Cleveland, Ohio, and he will do the rest.

J. C. Stewart of Monmouth, Ill., is advertising several Percheron stallions and a French draft in this issue. Look up the ad.

Hereford cattle breeders and buyers will everywhere be interested in the sale at Kansas City, May 6. We want everyone to send for catalog, as per advertisement in this issue. R. T. Thornton, the manager, states that he does not believe there is a cow in the offering that her first calf will not pay for her when it is 15 months old. The cattle have not been prepared but will be sold in only good thrifty breeding condition. Write for catalog or other information about the sale to R. T. Thornton, Sale Manager, 1318 East Fifteenth Street, Kansas City, Mo.

A bargain in the way of a good young jack is offered by F. D. Terry, Centaur, Mo.

Read the ad in this issue of C. H. Wempe, Seneca, Kas. He is offering a black Percheron stallion for sale or trade. The ad tells all about it.

Some very choice drafters are advertised in this issue by Chas. Piper of Buckingham, Ill.

C. N. Herbranson of Rollag, Minn., has 320 acres of land that he wishes to trade for stock, or he will sell for cash. See the ad in this issue.

If you are in the market for Percheron mares or fillies, look up the advertisement in this issue of Manual Cross, Adrian.

Read the new advertisement in this issue of J. C. Kerr, Wichita, Kas. If you are in the market no doubt he could interest you.

Hart Bros. of Osceola, Ia., start their advertisement in this issue. They state that they have the best collection of Percherons, Belgians and Shires they ever imported.

The Henry-Pile Realty Co., Excelsior Springs, Mo., are advertising saddle stallions and Guernsey bull calves for sale in this issue.

A Belgian stallion is advertised for sale in this issue by J. M. Cuplin, Ainsworth, Neb. Read the ad.

A baragin in the way of a trotting bred stallion is advertised in this issue by L. D. Richardson, 329 Palace Bldg., Minneapolis, Minn. Read the ad.

D. B. Kirby, Grain Valley, Mo., has a Percheron stallion and a jack that he wishes to sell, or will trade for jennets.

Read the ad in this issue of Dr. Ed C. Barr, Waverly, Kas. He has a jack to trade.

Any one wishing to buy Rose Comb Rhode Island Red chickens, or eggs, should read the ad in this issue of C. W. Fansler, Prairie View, Kas.

A good man that understands the capsule system of breeding should look up the advertisement in this issue of Burt H. Whitely, Muncie, Ind. He is in the market for a man to handle his stock.

Kentucky Sales Stables, Fort Smith, Ark., are offering two jacks and some saddle stallions at a sacrifice price in order to close their barn for the season.

L. A. Byrne, Texarkana, Ark., would like to exchange some land for mares, fillies or Jersey cattle.

Look up the advertisement in this issue of Geo. H. Simpson, Wheatland, Ill. He has Shetland ponies for sale or lease.

Any one in the market for a Morgan stallion should look for the advertisement in this issue of A. A. Koboskie, Beaver Dam, Wis.—Advertisement.

Big Shrink in Meat Supplies

Shortage For Three Months of 1913 Nearly 1,500,000 Cattle, Hogs and Sheep. Floods Dull Horse Market and Lower Cattle. First Relief Shoots Hog Prices Up to Record Level.

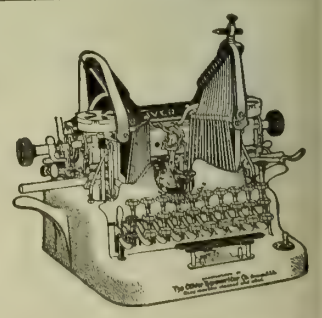
The week closing March 22, found the trade in horses and mules in a healthy condition. Whatever loss had been reported in the preceding two weeks was regained, and demand was on a broad basis, coming from farm, industrial and construction centers. The East was calling for the drafters, and other sections taking the lighter weight classes. But the week beginning March 23 experienced a paralyzed demand, temporarily. The tornado in Omaha started the days of disaster, and Ohio and Indiana followed with more serious flood conditions that are now extending their influence along the lower Mississippi valley. Demand for horses was delayed by the lack of railroad facilities east. At the present time the Eastern condition is greatly improved over last week, but still below normal. Eastern demand will be retarded for a few days longer, and Southern demand, especially from the south central cotton belt, will be uncertain until the flood waters have passed. The real status of the horse trade, though disturbed by weather conditions, is healthy. As soon as railroad service is established demand will be quickened and broadened, and the past few days of warm weather will put new energy into farm demand. At present Texas on the Southeast and Montana on the Northeast are two zones of the liveliest trade. In both these states (the first and third largest in the Union) the farm is calling for horse power. The central west is being called on to meet that demand. Western Kansas, where loss from last fall's scourge among horses was large, is buying freely.

The quality of the horses coming now is none too good and considerable demand is being held back on that account. When the full Eastern trade opens again heavy drafters will get a general uplift. Country buyers say that good big horses are hard to find, and the right kind where offered for sale are held at very high prices. About the usual amount of demand is reported for the pluggy and crowbait class, sales of $10 to $40 being reported, but they are the kind that regular dealers, country buyers and traders hate to handle, on account of the uncertainty of demand.

The general prospects for a late spring demand are excellent. As one line of requirement is filled another bobs up to take its place. Crop prospects later will be a determining factor for some demand. The fall sown wheat is in excellent condition; in much of the South and Southwest seeding is well along, and in southern Texas there is an unusually large acreage of cotton. Farm activities will swing north with rising temperatures.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs. up.	$235@285
Drafters, fair to good	150@240
Chunks, fair to choice	135@175
Chunks, fair to good	90@130
Expressers and light draft	60@120
Plain workers	50@ 90
Southerns, good	130@150
Southerns, plain to fair	70@125
Plugs.	15@ 45
Mules—	
13 to 14 hands	$ 85@135
14 to 15½ hands	125@165
15½ to 16 hands	160@200
16 to 16½ hands	190@285



March Cattle Prices Close Lower.

Closing prices for cattle last month were under the high levels established the middle of the month by 25 to 50 cents. The heavy plain steers declined the most, and the smooth finished classes, all weights, the least. The market was very unsettled in the past week, and more uncertainties showed than at any preceding time this year. Weather conditions already recited were responsible for such a change. This excluded Eastern demand for beef and markets, from Chicago west, were shut up to entirely local requirements. Killers took advantage of such conditions and forced prices down. The market now is where better shipping facilities will be a great benefit. Packers now are beginning to figure on early grass fat cattle from Southern Texas, but it will be more than a month before such supplies begin to move. They will be good this year, as the range has opened up early. Colorado and northern Texas are rapidly decreasing their supply of fat cattle, and another month will find no large supplies in any direction. The top price for steers in the past two weeks was $9 to $9.20, though in the past week none sold above $8.75 in Kansas City or $9 in Chicago. On the quarantine side several bunches of steers sold at $8.50 to $8.80, the highest prices ever paid for cattle from below the quarantine line. The bulk of the cattle sold at $7.90 to $8.50. While average quality of the offerings has been good there is a great scarcity of real finished steers, but at the same time that class commands only a narrow margin over those with less finish. The yearling class is scarce and in strong demand.

AGENTS—$173 IN TWO WEEKS MADE By Mr. Williams, Illinois, selling the Automatic Jack Combination 12 tools in one. WHITE'S SHORTHORNS
Good Cattle, Good Breeding, Good Dealing.
A few bulls of extra quality. A few young Poland China boars. Inspection invited.
C. H. WHITE, Burlington, Kas.

Rough, heavy steers have been neglected.

Quotations from the various grades of killing steers are as follows:

Prime corn fat steers	$8.50@8.75
Good to choice steers	8.00@8.45
Fair to good steers	7.50@8.00
Common to fair steers	6.50@7.45
Meal fed, choice	7.40@8.00
Meal fed, common to fair	6.50@7.35

Break in Butcher Cattle.

Affected by interrupted demand, and declining steer prices, the market for butcher cattle broke sharply in the past two weeks, and was considerably under the high levels made early in March. Demand, however, has been up some in the past few days and with normal shipping demand east the market will soon be back to the high levels. Choice heifers and steers and heifers have been very scarce, and April is generally a month of excellent demand for the light weight, well fattened classes. Cows are selling at $4 to $7.50, heifers, $5 to $8.25. Veal calves sold up to $10.50 shortly after the middle of March in Kansas City and as high as $12 in Chicago. Now prices are off 50 cents to $1. Bulls are high, many selling up to $7.50. Mixed butcher classes are scarce and in good demand.

The following quotations are for the various grades of butcher stuff:

Cows	
Choice	$7.15@7.50
Fair to good	5.50@7.10
Common to fair	4.50@5.45
Canners	4.00@4.50
Heifers	
Choice fed	8.00@8.25
Good to choice	7.25@8.00
Plain to fair	6.00@7.20
Common	5.00@6.00
Veal calves	5.00@10.50
Bulls	4.50@7.50

Slackened Demand for Feeders.

Prices for stockers and feeders two weeks ago were at the highest levels ever known and since then the market has eased off 25 to 40 cents. With lower prices the supply has decreased and the market now appears firm at the decline. Active trade is still reported throughout the country, and a general shortage is reported from all sources. Breeding cattle show no quotable change. Stock calves are down 50 cents.

The following quotations are for stock and feeding cattle:

Selected feeders	$7.75@8.15
Good to choice feeders	7.40@7.70
Plain to fair feeders	7.00@7.35
Good to choice stockers	7.00@7.60
Selected stockers	7.60@8.00
Plain to fair stockers	6.50@7.00
Stock calves	6.50@7.50
Stock cows	4.75@6.35
Stock heifers	5.00@6.75
Milch cows	35.00@90.00

New High Levels for Hogs.

Much of the time in the past two weeks hog prices were at the nine dollar mark, and Thursday of last week, $9.20 was reached in Kansas City, $9.40 in Chicago and St. Louis and $9.05 and $9.10 at other Western ponits. Friday there was a sharp break in prices, followed by a partial rally at Missouri river points, and the Chicago market made new high levels for the year at $9.55. April 1 relief from the tie-up caused by floods, started demand anew and prices shot up 10 to 20 cents, establishing new records of $9.25 and $9.62½ for Kansas city and Chicago, respectively. Most of the hogs coming are in the heavier classes and packers are buying them at 10 to 15 cents less than the lighter weight classes. Owing to the 80 pounds dockage on stags, sausage makers are buying them at a premium over other heavy hogs. This will last only a few weeks longer. The general price level throughout the month of March was the second highest ever reported in the third month of the year.

The following quotations are for hogs on April 1:

Choice, 250@300 lbs	$8.90@9.05
Choice, 200@245 lbs	9.00@9.25
Medium weight	9.00@9.25
Light weight	9.00@9.25
Common to fair	8.80@9.00
Stags	7.50@9.00
Boars	5.00@9.00
Bulk of sales	8.95@9.15

The following table shows the range in hog prices in the last two weeks of March:

		Preceding Week.	
Mon., Mch. 24	$8.60@8.90	$8.65	@8.95
Tuesday	8.75@9.10	8.75	@9.10
Wednesday	8.75@9.15	8.75	@9.05
Thursday	8.80@9.20	8.60	@8.80
Friday	8.65@9.05	8.70	@8.95
Saturday	8.85@9.00	8.77½	@8.90
Mon., Mch. 31	8.80@9.05		

Sheep Prices About Steady.

Sheep prices in the past two weeks have shown little net change. Demand for heavy sheep has increased moderately and light weight class is closing stronger. Lamb prices have fluctuated 25 to 40 cents, and now appear in a firm position. Some clipped sheep and lambs are coming and they are selling 75 cents to $1 under quotations for wooled grades. Western sheep and lambs continue to make up the bulk of the offerings. Some Texas clipped grass fat sheep are expected here about April 15. Choice fat lambs are quoted at $7.75 to $8.65, yearlings $7 to $7.75, wethers $6 to $7, ewes $5.75 to $6.75.

Receipts of Live Stock.

March receipts of live stock at the five Western markets show a decrease of about 23,000 cattle, 260,000 hogs,

Tell Me How Many Head of Stock You Have and—

I'll feed them 60 days before you pay. I'll show you how to make your farm animals grow faster—thrive better—put on more flesh on no more feed—make you more money.

I'll Rid Them of Worms or No Pay

I'll drive out the blood-sucking, life-sapping, disease-breeding parasites which multiply in the stomach and intestines, killing off your hogs and sheep, starving your horses and cattle, and stealing your feed and profits. I'll send you enough Sal-Vet to last all your stock 60 days. Simply put it where all your farm animals can run to it freely. ***They will doctor themselves.*** Don't send any money—just the coupon. Fill it out and mail today.

Sidney R. Feil
President.

What SAL-VET Is and Does

Sal-Vet is a wonder-working medicated salt which completely rids farm animals of their greatest enemies—the stomach and free intestinal worms. These deadly pests are the cause of 90% of all live-stock diseases. They keep farm stock in a poor, weakened, money-losing condition—they are the first step to hog cholera, swine plague, horse plague and other contagious diseases.

How SAL-VET Prevents Diseases

Sal-Vet prevents heavy losses when disease breaks out in your neighborhood because it kills and expels these deadly, life-sapping pests and puts every animal on your farm in a healthy, vigorous, worm-free condition—enabling them to better resist these deadly plagues. It sharpens the appetite, improves digestion and makes all stock grow into profit fast because it helps them get the good of all their food. Being a salt, animals like it and run to it freely—and

THEY DOCTOR THEMSELVES!

It requires no mixing—no drenching—no dosing—no trouble at all. Leading agricultural colleges and all prominent live-stock authorities endorse it.

Let me send you a 60-day supply without a penny of pay in advance.

Send No Money—Just the Coupon

All I ask you to do is to fill out the coupon, tell me how many head of stock you have, and mail it to me today. I'll ship you enough Sal-Vet to last all your stock 60 days. You simply pay the freight charges when it arrives and at the end of 60 days report results. If Sal-Vet does not do what I claim you won't owe me a penny. Send the coupon NOW. Address

Proof That Proves From Actual Users

"As the hog cholera is prevalent all through this section, I have been feeding Sal-Vet to my hogs. Since then, I never saw them in better condition in spite of the fact that all around me the cholera is carrying them off by the hundreds."—W. J. BROOKS, Diggs, Va.

Sal-Vet will do all you claim for it. My pure-bred Berkshire hogs are doing fine, and have appetites so keen that they never seem to get enough to eat. Before I began to feed Sal-Vet the same animals were dull, listless and without appetite. They take to the Sal-Vet keenly. Hogs all over our county are dying in large numbers, and many right here in my own town have lost hogs from some cause, but I could not wish mine to do better than they have done since feeding Sal-Vet.—D. E. KNIGHT, Honea Path, S. C.

"Cholera attacked my neighbor's hogs, and one of them died. He started to feed Sal-Vet and has not lost any since. I have been feeding Sal-Vet and have not had a sick hog on the place."—J. J. G. FERRELL, Vandorn, Ala.

"A lot of hogs died in this county from swine plague or cholera. Some of them were within three miles of me, but I have been feeding Sal-Vet, and have not lost a single hog. They are all doing well, eat all I give them and have good appetite for more."—D. A. ROSS, Kingman, Kans., Breeder of Pure Bred Poland Chinas.

"Sal-Vet has been of great service to us; it has kept our hogs and pigs free from worms and, in addition, proved to be a splendid tonic."—J. B. ESPY, Agriculturist, Southeast Alabama Experiment Station, Abbeville, Ala.

"For their own good, I would recommend Sal-Vet to all sheep men. It will destroy every stomach worm in the flock and keep your sheep and lambs free from them and at the same time keep the flock in the pink of condition and health."—ROBERT S. BLASTOCK, Mgr. Sheep Dept., Walnut Hall Stock Farm, Donerail, Ky.

PRICES 40 lbs., $2.25; 100 lbs., $5.00; 200 lbs., $9.00; 300 lbs., $13.00; 500 lbs., $21.12. No orders filled for less than 40 lbs. Never sold in bulk; only in Trade-Marked Sal-Vet packages.

and 170,000 sheep. This brings the total decrease for the three months this year up to nearly 1½ million head. Hogs are 948,000 short, and April is expected to uncover further shortages. In cattle, Kansas City and St. Louis show moderate increases, but other points decreases, and all show a loss of sheep. The five Western markets thus far this year received 1,678,050 cattle, 4,555,000 hogs, 2,572,100 sheep, compared with 1,779,300 cattle, 5,503,000 hogs, and 2,937,300 sheep in the same period in 1912.

NEW ERA FOR CATTLE BREEDERS

To the American Breeder: A new era for cattle breeding is at hand. A hopeful sign of coming prosperity has lifted the veil of frowns that has so long lingered upon the brows of the cattle breeder, and today the reward for his persistent efforts is in sight.

From the four points of the compass comes the country wide clamor for beef breeding cattle. Not always, to the swift, is the race, but to him who stays. A few years ago the prophecy that the great ranges would come to Chicago, Kansas City and Omaha, to buy breeding cows, would have been ridiculed, yet it has come to pass.

Only about a year ago the ranchman demanded bulls 2 years old. A little later they concluded they would buy the yearlings; last fall they were anxious, and robbed the cow of its sucking calf. Now many are contracting a year in advance for calves yet unborn.

The Herefords have fired the first gun in the campaign for balanced agriculture. The past year the Herefords have won laurels in the show ring over all other beef breeds and have made the highest average in a public sale. The future is exceptionally bright for the Hereford breeder. The high price of beef, the strong demand for breeding cattle, together with the growing popularity of the breed, is sure to materially advance the price of good pure bred Herefords far beyond what it is today.—Dr. R. T. Thornton, Jackson County, Mo.

STARTING GOOD CATTLE RIGHT.

To the American Breeder: There is one matter that concerns alike the farmers and all breeders of fine stock of all sorts, and that is the sire. The sire is one-half of the herd and sometimes more. I do not say that the sire will get all good calves out of poor cows, but he will improve them every time, and by good judgment in buying a second bull, you will be more than surprised and pleased with the improvement that the two good sires have made from only a moderately good herd of females. It would not pay any farmer that has four or six grade cows to keep a valuable bull, but two or three could join in buying a bull and equally pay the expense. I have seen that done in the old country and it was a great help to all and not very much expense to three or four.

If you have provided for good calves, a good way to keep them good is to have your calves come the last week of September or October. Give them a warm shed all winter, excepting during warm days; teach them to eat as early as you can, feed them equal parts of shelled corn and oats, with a little bran, a little old process oil meal and cut alfalfa or clover hay. Give them good exercise outdoors every day in good weather, but do not let them have to take shelter on the north side of a wire fence. Do not feed them more grain than they will clean up; let them run with the cows the following summer and continue feeding them through the summer; take them from the cows in July or August and give them full feed of chopped corn, cotton seed meal and cut green corn as long as you have it, then feed them cut alfalfa hay with their feed instead of green corn. Feed them regularly and let them clean it up. Do not let feed stay in the troughs. Clean troughs mean good appetite for next feed. This care will pay whether you are growing beef or breeding stock.

In taking care of calves for the breeding of pedigree cattle I would feed them about the same until the calves are weaned. Then I would separate the bulls from the heifers and not feed the heifers quite as strong—give them more cut hay or ensilage in their mixed feed.

Select your good bulls that you can recommend to a buyer and use your knife on the other ones. A good steer is worth more than a poor bull, and when buyers know that you keep nothing but the good ones, they will know that you are the right sort of man to buy from as it is now time for men interested in cattle to buy only the good ones. — Thomas Minton, Cooper County, Mo.

ONE DAY; ONE MARKET; $4,000,000

Just how much money Chicago and other live stock markets are remitting to live stock growers in the country every week is not generally understood.

An illustration will suffice. On Monday, March 10, Chicago received 2,407 cars of live stock and aggregated sales on that day were $3,982,292.16.

The average cost per carload was $1,654.46. Many cars of cattle sold at a range of $1,800 to $2,200, and of hogs above $1,500. Including hogs direct to packers, Chicago's bill for live stock on that Monday exceeded four million dollars.—Live Stock World.

And two lots in Atwood, Kas., to trade for stallions and jacks. **A. Madsen & Sons, Atwood, Rawlins County, Kas.**

WILL EXCHANGE
Good Southern farm and timber land for good brood mares and fillies, or Jersey cattle. **L. A. Byrne, Texarkana, Miller County, Ark.**

Get Your Canadian Home From the Canadian Pacific

WE will make you a long-time loan—you will have 20 years to pay for the land and repay the loan—you can move on the land at once—and your Canadian farm will *make you independent.*

20 Years to Pay

Rich Canadian land for from $11 to $30 per acre. You pay only one-twentieth down—balance in 19 equal annual payments. Long before your final payment comes due your farm will have paid for itself over and over. This advertisement is directed only to farmers or to men who will occupy or improve the land.

We Lend You $2000 For Improvements

The $2,000 loan will help you in erecting your buildings, and you are given twenty years in which to fully repay this loan. You pay only the banking interest of 6 per cent.

Advance of Live Stock on Loan Basis

The Company, in case of approved land purchaser who is in a position and has the knowledge to take care of his stock, will advance cattle, sheep and hogs up to the value of $1,000 on a loan basis, so as to enable the settler to get started from the first on the right basis of mixed farming. If you do not want to wait until you can complete your own buildings and cultivate your farm, select one of our Ready-Made farms—developed by C. P. R. Agricultural Experts—with buildings complete, land cultivated and in crop, and pay for it in 20 years. We give the valuable assistance of great demonstration farms—free.

This Great Offer Based on Good Land

Finest land on earth for grain growing, cattle, hog, sheep and horse raising, dairying, poultry, vegetables and general mixed farming, irrigated lands for intensive farming—non-irrigated lands with ample rainfall for mixed and grain farming. These lands are on or near established lines of railway, near established towns.

Ask for our handsome illustrated books on Manitoba, Saskatchewan and Alberta—mention the one you wish. Also maps with full information *free.* Write today.

Canadian Pacific Railway

Colonization Department

112 W. Adams St., Chicago

FOR SALE—Town lots in all growing towns—Ask for information concerning Industrial and Business openings in all towns.

SNAP FOR STOCKMEN

$5 to $15 Per Acre.

For Missouri or Oklahoma lands, practically all in native blue stem grass, 50 per cent subject to cultivation, fine running water, two to eight miles from Kansas City Southern Ry., and only 200 miles straight run to Kansas City market.

Cattle and hogs are being raised and laid down on the K. C. market at less cost and greater profit than at any other point in the southwest. Pasturage most all year 'round. Clover, alfalfa, corn ,etc., make good crops. Ample rainfall. Most of land in native timber with fine grass.

BEST HOG COUNTRY IN THE WORLD

Stock hogs come from this section because they are free from disease and it costs practically nothing to raise them.

Fine climate. No bad blizzards or hot winds. Ideal country to enjoy life and make money. This same land put in fruit is netting annually $100 to $150 an acre. Tracts of several hundred acres or more at $5 to $15 per acre. For particulars address **Wm. Nicholson, Immigration Agent,**

KANSAS CITY SOUTHERN RAILWAY, 871 Thayer Bldg., Kansas City, Mo.

LAND FOR STOCK OR FOR CASH.

Will sell or trade 320 acres in Crow Wing County, Minnesota. Will trade for registered stallion and mares, jack and jennets, or cattle. Address C. N. Herbranson, Rollag, Minn.

"REAL ESTATE WANTED."

Sell your property quickly for cash, no matter where located; particulars free.—Real Estate Salesman Co., Desk 9. Lincoln, Neb.

ANTI-HORSETHIEF REGULATIONS.

To the American Breeder: We are certainly getting value received through your paper. The first lesson in horse breeding is worth more than the price of three years' subscription to any one. Now we are after more information and I know of no one who is more able to instruct us than our editor of the American Breeder. On account of a great amount of horse and cattle thieving, we are trying to organize an anti-horse and cattle thief association. We would like him to suggest by-laws or print by-laws of other associations so we may be recognized by them. If the editor does not see fit to publish this in the next issue we would be very grateful to him for an answer by letter.—J. P. Spires, Union County, New Mexico.

Who can give us the by-laws and methods followed by successful organizations to prevent the stealing of live stock?—Editor.

BIG TEXAS SILO ORDER.

Forty-five silos in one order is a considerable silo order. It was made by a woman—Mrs. Henrietta King, owner of King Ranch in South Texas, covering 1,000,000 acres.—Agricultural Advertising.

Questions and Answers.

(Continued from page 5.)

from service until the inflammation has subsided. In the meantime, apply the following three times a day: Alcohol eight ounces, witch hazel eight ounces, tannic acid one dram. Mix all together and shake well before applying.

SHY BREEDING MARE—I have a mare that will take the horse at any time. I have made an examination and she appears all right, but I can't get her in foal. What can I do for her? She appears to be in good health. Indiana Subscriber.

REPLY—It is difficult for us to tell much about this mare from your description. We would advise you to study the lessons in horse breeding, and other material in this issue, very carefully, then you may be in a better position to give a more accurate description.

MARE FAILS TO CONCEIVE—I have a mare seven years old this spring. She had three colts and last spring I bred her when her colt was nine days old, but she did not settle; bred her back in 21 days; did not settle that time, then in 21 days she came in heat again; then I examined her and found her womb with a small torn place in the mouth of it. Then I bred her again and put her in the barn to rest as I always do; then in one hour took her out to pasture and she was stiff, mostly in the hind parts; stayed so for about a week when going down hill. My stallion is a ton horse but very quiet. This mare weighs 1,200 pounds. She did not settle at all; did not breed her after she got stiff. She is apparently all right now. I would like to know if this mare will do to breed this spring without big risk?—Missouri Subscriber.

REPLY—If you mare is in good physical condition, and her genital tract is sound, she may be bred this season, using preferably the capsule method.

EVERSION OF THE UTERUS—My customer had a mare in good health to drop a colt one night in June, 1912. In the morning her afterbirth hadn't come, so he turned her out and she grazed around until noon, seeming in no misery. Then she began straining very hard; about the third time she strained her whole womb came to the world instead. Help was summoned and it was washed and picked perfectly clean, as directed, then put back in place as near right as possible. She got along fine and the ninth day she was in heat. What do you think caused this? It was her second colt, one the year before. Can he breed her this year? Would it have been all right to have bred her last season? Is there any danger of her having the same trouble again if she is bred?—Idaho Subscriber.

REPLY—Your letter indicates that the retention of the afterbirth was the cause of the violent labor pains that resulted in the eversion of the uterus. If the mare is in general good health there should be no objection to breeding her this season as it is very likely no trouble will be experienced at foaling time.

GERMAN COACH STALLION—I have just purchased a registered German Coach stallion. Am moving him from Los Angeles, California, to Utah. What effect will the change of climate have on him? He is ten years old. Where can I get some information as to crossing him with grade Percherons and range mares?—Utah Subscriber.

REPLY—The change in climate should not affect your horse very seriously if you will take good care of him and administer the same kind of feed that he formerly has had. The best place for you to get information concerning crossing light stallions of any kind with grade Percherons is in the horse markets. You will find, after a careful study, that you have made a mistake unless your grades are very inferior. The best market demands are for the bigger horses. Smaller horses, such as the cross you mention, will not net you the same profit as would be the case had you

BELGIUM EMPORIUM OF AMERICA

150—Head Stallions, Mares and Colts—150.

Including a few choice Percherons; 60 stallions imported October, 1912, and another **Large Importation of Stallions** arrived in March, 1913, enabling me to continue saying that I have **the largest collection of Belgian Draft Horses to be found anywhere in America.** The supply on hand never allowed to run low; you will at all times find a large and choice lot from which to make a selection. You will be delighted at the Belgian Horse Show to which you will be treated while here. I can satisfy you in price; I can satisfy you in quality; Bays, Browns, Blacks, Sorrels and Roans.

Get on the train, come to Cedar Rapids or Iowa City, then phone me at Fairfax to have team or auto meet you at electric car line. Car every hour from Cedar Rapids and from Iowa City. Catalogue ready. Farms two miles from Fairfax; three miles from electric car line.

H. LEFEBURE,

Fairfax -o- Linn County -o- Iowa

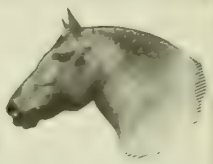
VALUABLE BELGIAN STALLION FOR SALE CHEAP.

I want to sell my imported Royal Belgian stallion, No. 21658, or will trade for young stock. This stallion is 14 years old; has been a wonderful breeder has sired more good colts than any other stallion ever in the county. Stands 16¾ hands; has weighed over a ton; has 11½ inch front and 12½ inch hind bone in smallest place. I am offering this stallion for the reason that he has been on my farm for ten years; never off only when working, and the neighborhood is full of his mares. If interested, come and see or write for more description.

L. C. DAVIS, UNIONVILLE, PUTNAM COUNTY, MO. R. F. D. No. 4.

W. A. LANG & CO.

Greeley, Delaware County, Iowa



Importers of BELGIAN and PERCHERON STALLIONS AND MARES.

We wish to announce to the buying public that we will now, as in the past, give you more good, sound, young horses for the money than you can get elsewhere. We do not advertise cheap stock because we do not think the best breeders want that kind, but we will sell you the good ones at as reasonable margin of profit as possible and do a remunerative business. All horses are backed up by our GILT EDGE GUARANTEE. Write for full particulars, mentioning this paper.

D. K. ROTH

THREE CLYDESDALE STALLIONS

for sale, coming four and three years old. **James Spear, Stanwood, Cedar County, Iowa.**

SHIRES FOR SALE.

A six year old stallion; weighs over a ton; well broke to work; gets 75 per cent of mares in foal. State certificate of soundness furnished. Must sell on account of his colts. Have his colts to show. Recorded. Price $800.

Also fillies from weanlings up, and mares in foal. All sound and recorded. Prices on them from $200 to $550.

B. M. Boyer & Sons, Farmington, Ia.

CLYDESDALE HORSES

Stallions and mares of all ages for sale.

Also Shorthorn Cattle.

W. A. DeMerritt

Route 2, Plainfield, Ill.

SHIRE AND PERCHERON

Stallions and Mares.

Imported long enough ago to be thoroughly acclimated and in thrifty condition. Good horses with quality at reasonable prices. Inspection invited. Will meet you at C. R. I. & P. or Interurban Ry., if notified. **H. P. Wilkinson Bros., Mitchellville, Iowa.**

REGISTERED STALLIONS.

Four Clydesdales and one Percheron coming two years old; all big fellows with plenty of bone and quality. **John H. Chambers, Edinburg, Johnson County, Indiana.**

MORGANS WANTED.

I want a team of young black Morgan mares; weight about 1200 pounds each. Must be sound and well matched. **W. A. Speer, Buckingham, Tama County, Iowa.**

21 HIGH CLASS STALLIONS

For sale at low prices for quality of stock. Eight saddlers, five trotters and eight Shetland ponies; royally bred and grand individuals—many of them prize winners in strong competition. For prices and full description, address **Barbee Stock Farm, Monticello, Drew County, Ark.**

FOUR MORGAN STALLIONS.

For sale; registered; all blacks; 15½ hands; 1,100 pounds; matured and good ages. Will sell for $300 to $1,000 each. If looking for Morgans be sure and inspect my horses as they are of the very best type and Black Hawk breeding. **E. F. Brown, Derby, Lucas County, Iowa. Rte. 2.**

LIVE STOCK PICTURES.

I make the best class of live stock photographs—suitable for making cuts or for framing. Drawings or paintings, if desired, but no cheap work. The leading live stock and farm papers of the country use my pictures. **H. L. Ritchie, Mt. Washington, Mo.**

BAD DEBTS COLLECTED.
Stallion Notes a Specialty.
E. R. Smith, Lawyer, Fairfield, Iowa.

purchased a good draft stallion. There have been some very good horses sired by German Coach stallions, but a considerable change in market conditions has taken place during the last few years.

FISTULA OF THE JAW—We have a bay pony five years old that has a running sore on the under jaw about half way between mouth and upper end of jaw bone. It discharges pus of a gray color. The hole is very small. We run a probe in just three inches and it seems to go toward the root of the tongue. His teeth seem to be all right. He don't show any soreness when he eats corn or hay. We asked the man we bought him of and he said he bruised it on the edge of feed box, it being a little too high for him. He said the veterinarian said it would amount to nothing, and he put some brown powder on it. He said it got well and had never been sore. We only had him a few days until it broke out and has been running for six weeks. We have injected iodine in it and a solution of sulphate of copper, but it does not seem to do a bit of good. What treatment would you prescribe if you think it can be healed up successfully. We used a fistula syringe and find on using this syringe that the medicine goes through into his mouth.—Missouri Subscriber.

REPLY—Your letter would indicate that your pony has a fistulous tract which may communicate with some of the adjunct bones of the part and that it will very likely need a little surgical attention before it recovers. The treatment you have given should have helped put things to rights had it been a simple case. We would suggest that you take your animal to a competent veterinarian and find out just what structures are involved before undertaking further treatment.

CLEANING A STALLION—Please advise me how to make and how to use the bran for cleaning stallions.—Colorado Subscriber.

REPLY—Mix bran and water together and put handful after handful up in the sheath and push it around in such a shape that all of the wrinkles will be exposed to the bran. Do not wash him. The bran will come out and remove with it a lot of dirt. The penis and the sheath will be smooth unless it is a serious case.

RIDGLING—I have a good grade colt coming two years old. I got this colt castrated last spring by one of the men who does all our castrating. He is not a graduate of any college. Only one seed, or testicle, could be taken from him, the other was not visible or could not be reached by the proper opening, and now he is troubled some; would serve mares. Can this remaining testicle be taken without endangering this colt's life? A certain veterinarian told me the remaining testicle lay up close to the backbone. What would you advise me in this case. Do you have any practical knowledge with horses or colts of this kind? We do not have a professional veterinarian handy or I would consult him on this case. One man who is an ordinary hand only, said he must be opened in the side to get the remaining testicle from him. Please tell me what to do.—Pennsylvania Subscriber.

REPLY—It is quite likely that your colt is a ridgling and you should not entrust his castration to anyone but a qualified and experienced man. Such animals are castrated successfully by men qualified for that work and with but little risk of loss. This operation is not performed by going through the side as suggested by your friend. You have plenty of good men in your state who are qualified to do this work.

BREEDING DISEASED MARES—What precaution should one take to prevent a stallion transmitting disease from one mare to another? —Indiana Subscriber.

REPLY—The only protection that we know of is to refuse to let the stallion make a natural service on a diseased mare. It is usually a waste of time to try to wash the penis. Any antiseptic strong enough to destroy the germs would injure the penis.

THRUSH—I have a horse with thrush in hind feet; in bad condition for nine months; hair on legs sometimes wet. Would standing in copperas water be good? What is the difference in thrush and canker? Can canker be cured?—Illinois Subscriber.

REPLY—It is very important in treating thrush to first trim the frog so as to expose the deeper parts that are affected and then thoroughly wash and scrape the parts so as to remove all the dirt. Pack all the affected parts with dry calomel working it well down into every crevice. Repeat this daily until a cure is effected. Where the condition has extended up on the legs apply the following three times a day, shaking well before using: Zinc sulphate one ounce, lead acetate one and one-half ounces, water one quart. Mix all together. Canker is a much more intractable disease than thrush and if you are in any doubt as to the nature of the disease, we would suggest that you take the animal to a well qualified veterinarian before incurring expense for treatment.

UNREGISTERED JACK—Some time ago I saw an article in your paper about how to register an unregistered jack, but I can't find my paper, and I write to ask if you will send me the particulars about registering a jack. I have a fine jack and wish if possible to get him registered. Any information you can give me will be greatly appreciated.—Nebraska Subscriber.

REPLY—Write to Wm. E. Morton, 920 Scarritt Bldg., Kansas City, Mo., secretary of the Standard Jack and Jennet Registry of America, for application blanks. If your jack is 58 inches high from the center of the wethers to the ground, 62 inches around the heart girth, seven-inch bone between the knee and ankle, he can be registered. Every jack in the country that is big enough ought to be registered. See that all the jennets in your community are also registered.

HEAVY FORE TOP—I have a stallion three years old with a very heavy fore top that hangs over his eyes. Do you think it injurious to his eyes? Would you advise trimming it? His eyes matter a little; do you think it is caused by the fore top? He has a large, roomy box stall at night and has the run of the pasture through the day and is in good, healthy condition.—Missouri Subscriber.

REPLY—We fear the heavy fore top is responsible for the irritation of the eyes, and we would suggest that it be thinned and shortened so it will not annoy these organs. If you care to spend the time on it, the fore top may be confined to two loose braids, which may be tied to the halter on either side.

CHEAP LAND IN MISSOURI—Is there any good, cheap land in Missouri from $10 an acre and up? I would like to get a small place of from ten acres to not over 40 acres. I would like to have it for a chicken farm. I would just as soon have it unimproved, that is, so it was land that would be all right when it was improved.—Illinois Subscriber.

REPLY—There is not much good land in the state of Missouri that can be purchased for $10 an acre that would be suitable for farming. There is some rough land than can be purchased for this price, but the location is not likely to be convenient. Good values can be secured, perhaps, by going higher, but careful investigation should be made in any case.

MARES DO NOT GET IN FOAL—I have a number of mares that do not get with foal. I cannot think it is our stallion's fault as he gets all mares in foal that have colts by their side, usually the first service. I have examined these mares and the neck of uterus is healthy. How would it do to use ——— ——— on all mares not having colts by their side? And how

HOMEWOOD STOCK FARM

Percheron, Belgian, Shire Stallions and Mares

Now is the time to buy a good stallion or mare. We have the kind you have been looking for. Our horses arrived home in October and are now perfectly acclimated and in the best of condition to do you a lot of good.

The Percherons are two and three years old, with size, bone and draft horse quality—many of them weighing over a ton, and not fat.

Our mares are of the best brood type; all are in foal and plenty of ton mares to select from. Every animal guaranteed sound, and a satisfactory breeder. Others say we have the best bunch of two-year-old Percherons they ever saw; you will say the same. Come and see us or write for full particulars. You will find horses right, terms right and prices below others of equal merit. We have also a lot of big, heavy boned, American bred stallions at surprisingly low prices. Don't buy until you have seen our stock.

Homewood is on the main line of the Big Four and I. C. R. R., twenty-three miles south of Chicago. Trains hourly to and from the city.

S. METZ & SONS, Bell Phone, Homewood 58 W. Homewood, Ill.

GERMAIN 29430, (44788)

PERCHERONS FOR SALE AT RIVERSIDE STOCK FARM.

A fine lot of registered Percheron colts broke to service, weighing 1,600 to 1,775 pounds. Two-year-olds that weigh from 1,450 to 1,650 pounds; good colors of black and grey. These are the big bone kind and any colt out of eight head will mature into a ton horse or better. Imported and home bred mares for sale, including a span of well broke black four-year-olds I'll sell cheap.

Also four Mammoth bred jacks, 15 to 15½ hands high; all young; black with light points.

It will pay any breeder to come to our farm and look this stock over before buying. **O. L. THISLER, CHAPMAN, DICKINSON COUNTY, KANSAS.**

150 miles west from Kansas City on the Union Pacific, main line.

Galbraith's Percherons

Are of the same high standard as the Clydesdales which have made the name famous.

During the month of April especially low figures will be quoted on all the stock on hand, including a number of extra big, good boned, imported black Percherons, with quality and conformation. Address or call on

Alex. Galbraith & Son, De Kalb, Ill.

Draft and Coach Stallions

A fine bunch of Percheron, Belgian, French Draft and Coach stallions for sale; priced from $350 up. I have the big ton kind that are right. Come and see me, or write. J. M. Nolan, Paola, Miami County, Kas.

FRENCH DRAFT STALLION

for sale; four years old past; 1800 pounds now in common flesh; he ought to make a ton horse when full grown in his old clothes. Lots of good colts to show, and mares in foal. Will sell him cheap for cash, or trade for a good Belgian or Shire. M. P. Lyden, Cresco, Howard County, Iowa. Rte. 1.

PERCHERONS.

Imported and home bred stallions and mares, from $200 to $900 each. H. Redenius, Rushmore, Nobles County, Minn.

much would you use per gallon of water? And how long before breeding? How much to each mare, and would you put in womb or vagina, or both?—Kansas Subscriber.

REPLY—Study the lessons in horse breeding in this issue, also the articles on "Barren Mares."

OBSTINATE WOUNB—I have a mule with a wire cut that I can't get to heal and it is getting larger. He licks it. It is on his front foot above the hoof. What can I do for it?—Kansas Subscriber.

REPLY—You must expect this wound to behave badly as long as you permit the mule to lick it. If the new growth is large you should take the animal to a good veterinarian and have the growth removed. It may be that by touching the wound once a day for several days with lunar caustic you can get it to shrink down and assume a more healthy state. Apply the caustic until the wound shrinks and looks dry, and then follow with a two or three times a day application of the following: Sugar of lead one ounce, water one pint. Mix and apply with small piece of clean, soft cloth or absorbent cotton.

RESTLESS STALLION—What can you give a stallion to quiet him down and not hurt his breeding qualities. He is as crazy as in the season.—Iowa Subscriber.

REPLY—Give your stallion plenty of exercise. Have a stall where he can see what is going on around him. Get a gelding and put in the next stall to him so he will have company. It is time to start the breeding season with him, anyway. If there is no business for him, breed a mare or two for nothing so that he can get opened up; one mare the first week, two the second, three the third and so on.

INFECTED LEG—I have a two year old filly that was cut six weeks ago on a wire on her left hind leg. It was not much of a cut at first, but she got blood poison in it and had a very hard time with it. Leg swelled clear to the body as full as the hide would hold; by bathing it in hot soapsude twice a day and putting on liniment, I reduced the swelling, but it won't go clear down and is hard. What is best to do for it now? The swelling is all in front. Looking at the leg from behind it looks normal. She is not lame now, but does not lift her leg as high as the other. She had such fine hock action before she got hurt.—Arkansas Subscriber.

REPLY—There is nothing at this time that will do as much good as the freedom of a pasture during suitable weather when the animal may take exercise at will. A once a day application of alcohol and witch hazel, equal parts, which should be well rubbed in and the limb carefully kneaded and massaged for 20 or 30 minutes, will further aid in the reduction of the enlargement. You must be patient in the matter and must persist at these regular intervals if you are to expect results.

RANK STALLION—I have a registered stallion 13 years old that has trouble in unloading when he breeds the first of the season, but gets all right later, and gets big per cent of colts. He is very rank. Last year he was not able to do business for about two or three weeks after the season opened. Has had lots of exercise; is in good condition, not fat, but lively and ambitious. Been feeding oats and wild hay, a little fodder and a little corn. What can I do for him?—South Dakota Subscriber.

REPLY—Do not use this stallion as a teaser. When you have a mare ready to breed, sprinkle some hay under this horse so he will urinate. Have the mare in a handy position so that the stallion can come right out and make the mount; after the entrance is made let the mare take a step or two if she cares to. If this does not get results diminish the grain ration for a few days.

HORNY FORMATIONS—I have a Percheron stallion coming five this spring, and a good one, but he has on both hind legs a scurf or a horny scale which runs up from the pastern about six inches in streaks about a half inch wide. It does not hurt him in any way, but I would like to destroy the cause I don't know what it is.—Montana Subscriber.

REPLY—In some animals there is a tendency for the skin to become changed to that extent that horny tissue will form above the hoof line. This tendency can be frequently arrested by rubbing well into the parts daily a little mercurial ointment. Do not use very much, but apply a little and rub in gently with the finger.

KNOWLEDGE A NECESSITY—Can a person who has not had a course of lectures use the impregnator?—Missouri Subscriber.

REPLY—An average man can have fair results in artificial breeding, after careful reading, but the more he knows the better results he should have.

PONY WITH STIFF KNEE—I have a pony which has a big knee. She is very stiff in it and also in her limbs. Can you tell me anything that will take the swelling and stiffness out?—Nebraska Subscriber.

REPLY—The short description of your case does not lead us to think that treatment would pay in this case. It is more than likely there is some mechanical interference by this time. There are good veterinarians available in your locality and you should ask their advice inasmuch as a personal examination is of great aid in these chronic cases.

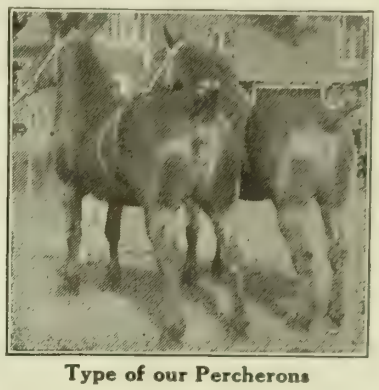
ARE JACKS SURER THAN STALLIONS—Is a jack any more apt to get a mare in foal that has missed one year?—Iowa Subscriber.

REPLY—Jacks are not quite as sure as stallions when used on mares, as some mares will not hybridize, but quite frequently jacks are better servers than stallions. In our opinion there is very little reason why a mare would produce better from one than the other. If in doubt about this case you might breed your mare with a capsule which is a little surer on an average, than either when properly done.

JACK DOWN—About a year ago I bought a fine jack, one of the best in this part of the country. He was thin in flesh when I got him but has gradually improved in flesh since I bought him, and this winter has gotten fat. Has had a small lot to run in all winter. Three weeks ago tonight I fed him and he was apparently all right; ate his feed all up. The next morning I went in to feed him and he was down and could not get up. He would groan like a horse with the colic, but was not bloated. I called a veterinarian at once and he pronounced it azoturia or kidney affection, and that it was a bad case. Then with his consent we called another veterinarian; he also called it kidney affection. They came two trips each the first week he was down but have not been here since. I am still treating him, but he has never been on his feet since he first went down. He is improving very slowly; eats and drinks heartily. It would be hard to tell what all I have done for him, but I have not doped him with all kinds of stuff as some would have done. I blistered him severely over the back and kidneys and gave him a good tonic regularly. I

This Kind of Appreciation Does It

To the American Breeder: I wish to tell you that I think the American Breeder is the best paper for both stallion and mare owners that is published in the United States today. I would not be without it at all. It has been worth more than $50 to me already. The lessons in horse breeding will fill a place that could not be filled any other way. I shall attend the breeding school next year. Send me fifty copies of April 5 issue and I will pledge myself for twenty new subscribers. Trusting you will have the success you are entitled to, I remain—C. M. Stamps, Upshur County, Tex.



Lafayette Stock Farm

We Are Glad to Inform our Many Customers and Interested Buyers that We Have Without Doubt the Largest and Best Selection of

Percheron and Belgian

STALLIONS AND MARES

both imported and American bred, ever offered to the trade, in ages running from three years old on up. The Percherons, blacks and grays in color; Belgians, blacks, roans, sorrels and bays in color.

Type of our Percherons

We can suit any buyer in a horse and price. We don't want the intending buyer to think because we won all the first prizes in France, except one in 1912, nor because we won most of the prizes offered at the International in 1912, that our horses are priced high. We can and will sell as low as any importer can sell them, quality considered, and with a good guarantee. We make terms to suit you.

J. CROUCH & SON, Props.

LAFAYETTE :-: :-: INDIANA

PETER HOPLEY & SON,

ATLANTIC and LEWIS, IOWA,

Importers of PERCHERONS and SHIRES

We have been making from one to three importations a year since 1884 of the best stallions and mares that we could find in France and Great Britain. **We have now the best lot of both breeds** of stallions and mares, nearly all two-year-olds, that we have ever had on our farms at one time. **They excel in weight, bone and quality.** We have two-year-olds weighing in moderate flesh **up to 1,950 lbs.** We have secured a number the get of the most noted sires in France and Great Britain. **We have a number of top show horses.** We want you to come and look them over, and you will agree that what we have said is conservatively stated, and in spite of our selections we are able to quote very moderate prices. Remember, our horses are all kept at the farms between Atlantic and Lewis, on the main line of the Rock Island, 60 miles east of Council Bluffs.

Stallions and Mares

At Bargain Prices

PERCHERONS, BELGIANS and SHIRES

NINETY-EIGHT HEAD FROM WHICH TO SELECT.

Forty Percheron stallions 2 to 4 years old; blacks, greys and a few bays. All registered in the Percheron Society. Several of these two year old will now weigh from 1800 to 1950. Price $500 to $1000. Three a little higher.

Fifteen Belgian stallions, 2 to 5 years old; bays and sorrels; two-year-olds that are weighing a ton. Price $500 to $1200.

Thirty Percheron mares, 2 to 8 years old; blacks, bays and greys. All registered in the Percheron Society; 22 showing heavy in foal. Price $300 to $700.

Ten head of Shire mares and stallions that I will sell at bargain prices. All of these stallions have been examined and found to be sound and of pure breeding, and certificate of such will go with each horse. If you want a real bargain in an imported or American bred stallion or mare, come right away as I mean business

L. R. WILEY, Emporia, Kans.

PERCHERON AND FRENCH DRAFT stallions for sale. One Percheron, coming three years; four Percherons coming two years, and one French Draft, coming two years.

Three of these colts are grandsons of the famous Besique 19602.

J. C. Stewart, Route 6, Monmouth, Ill.

TWO REGISTERED PERCHERON COLTS

for sale at a bargain. One black, coming one year old filly, also one black-gray coming two year old stud colt. Both good ones and for sale at a bargain. Have been shown at our county fairs and never defeated. **P. H. Summers, Callao, Macon County, Mo.**

FOR EXCHANGE.

Imported Percheron stallion; coming seven years; dark gray; fine disposition; splendid action; weight 1,900: a sure foal getter and a splendid sire. My only object in changing is that his fillies are in the way. **C. W. Traverse, Garden City, Blue Earth County, Minn.**

PERCHERON STALLION.

For sale. The Percheron stallion, Brilliant 87815:: registered in Percheron Society of America. Good breeder: sure foal getter; good heavy bone; quiet disposition, but with good life; broke to work. **Joseph Phillips' Estate, Hay Springs, Sheridan County, Neb.**

150 STALLIONS.

Home bred draft stallions, $250 to $650. Guarantee to sell you imported stallions for less money than any firm in America. Come to a live stallion market and see all draft breeds. **A. Latimer Wilson, Creston, Iowa.**

PERCHERON STALLION AND JACK

For sale or trade for good jennets. One good three-year-old gray Percheron stallion: weight 1600 pounds and sound; one extra good yearling black jack colt. Address **D. B. Kirby, Grain Valley, Mo.**

PERCHERON, BELGIAN AND COACH STALLIONS AND MARES, ALL AGES.

100 head to pick from; size, quality and breeding. We won over 50 first and second prizes and gold and silver medals at the Wisconsin State Fair. Grand Champion Belgian and Percheron stallion at head of stud. Prices and terms to suit. **Ives & Bellman, Delavan, Wis.**

THREE PERCHERON STALLIONS

For sale at farmer's prices: two and three years old: sound: with extra good bone. **F. T. Wallace, Assumption, Christian County, Ill.**

have also given him fluid extract of buchu 1½ ounce; fluid extract of colocynth 1¼ ounce; fluid extract of aconite 1½ drachm; fluid extract of colchicum ½ drachm; chloroform 1¼ ounce. Do you know of anything that would be better?—Missouri Subscriber.

REPLY—Your description does not enable us to come to a satisfactory conclusion as to the nature of the trouble with your jack, but we want to say right at the start that azoturia is a very rare disease in these animals. We fear that your jack is in part, at least, paralyzed from possibly an injury in the lumbar region. Why not place suitable slings under this animal and raise him to a standing position so that he can be more thoroughly examined. Has this animal been attended by a graduate veterinarian?

A RANK JACK—Can you give me some remedy that I could use to prevent my jack coming off his stand? He will not stay on long enough to make a good service.—Indiana Subscriber.

REPLY—Questions of this nature should give the age of the animal and how he has been handled, as well as the disposition of the animal. Animals that discharge too quickly are not the best producers. Occasionally a stallion or jack may make a very quick service and get average results. These kind of services are usually deposited in the vagina. Animals that deposit the semen into the uterus are the surest and should always be selected. We would advise in this case making a service with a halter. Be very gentle with this jack; do not speak harshly to him; watch the mare closely that she does not make a noise. Stand up close by the jack and gradually get him accustomed to having you take hold of the front leg; hold him on a little while. If he resents this performance, do not try to force it. Every young stallion or jack should be encouraged to stay on as long as possible during the first few services, and they should never be pulled off too quick. Give them plenty of time. In this case, the semen might be tested. If it is deposited in the vagina the hand should be washed and a capsule could be scooped up from the vagina and pushed on into the uterus. If the semen is not fertile, it might be well to investigate and see if the jack is masturbating.

DISTEMPER—I have a valuable young stallion and there is distemper in this community. Is there any remedy to prevent him from catching it?—Arkansas Subscriber.

REPLY—Write to Dr. A. T. Kinsley, 1336 East 15th St., Kansas City, Mo., and he can furnish you literature on the subject of bacterins which are agents that are used for preventing the class of diseases you mention. These products have proven very effective in preventing several suppurative diseases and we believe a careful trial of them according to directions will not prove disappointing to you.

BREEDING MARES—Where a mare has been bred and is still in heat, would there be any advantage in breeding her two times in six or seven days? Where a man has two horses would there be any advantage in breeding her to both horses, or to horse and jack? It would be the same as a double cover only using two horses.—Oklahoma Subscriber.

REPLY—It is not necessary to make a double cover or breed the ordinary mare twice during the same heat period. If the stallion is discharging live spermatozoa there are millions of these at every service; only one of them can be used in fertilization. What would be the object in depositing any more? If you will use a microscope and know that your stallion is sure, show the spermatozoa to the mare owner and explain the situation to him; he will know that your stallion is right, and if the mare does not get in foal, it is not the fault of the stallion. If you will use a microscope you will know whether it is necessary to make more than one service or not during a heat period. If your stallion is not discharging live spermatozoa, there would be no use to breed several times during one heat, as it would only add to your difficulty. Diminish the services so that the stallion will have an opportunity to create more germs.

FEEDING SILAGE TO HORSES—I would like to know if draft and farm horses which are standing in a sales stable to feed, could be fed profitably with corn silage as part of their ration, and if it would make good feed for them. If you can give me some scientific report on that I would very much appreciate it.—Wisconsin Subscriber.

REPLY—We invite responses to the above inquiry from any one who has had experience in feeding silage to horses. While silage is frequently made an almost exclusive diet for cattle and sheep for months with gratifying results, yet we are personally familiar with numerous cases where it has been made a part ration with horses and mules. In such cases it is spoken of very highly. Let us hear more about this from our readers.

RIDGLING HORSE—There is a ridgling horse on the stand here that seems to be a good breeder. Would there be any danger of him getting ridgling colts?—Iowa Subscriber.

REPLY—A ridgling stallion is liable to transmit a weakness to his progeny that may result in the same defect that the sire had. We would not advise the use of ridgling stallions, as it is very expensive and sometimes dangerous to castrate these animals.

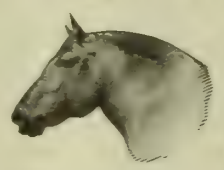
Percherons and Royal Belgians

We have decided to offer all of our state fair prize winners—22 stallions and mares—for sale. Every one of these horses have been shown and has been a prize winner at the shows of 1912. These stallions and mares will be sold at exceedingly low prices, quality considered.

We are showing some other good stallions and mares, which we offer at prices that defy competition.

We earnestly request you to look over our stallions and mares before buying.

True photos from life on application.



Address,

Four Royal Belgians imported by us in 1912.

WOLF BROS., Importers and Breeders. Boone County, ALBION, NEB.

"AMERICAN BRED PERCHERONS"

Anthon 25137 (45446) by Besique (19602), at head of herd. We have on hand several fillies and stud colts sired by Gouveneur 55323 (70200), for sale. Also a black stallion of fine quality coming three years old in July, for sale. Come and get a colt where you can see the sire and dam. Onarga is eighty-four miles south of Chicago on the I. C. R. R., and about seventy-five miles east of Peoria.

H. KNOCHE & SONS, Onarga, Ill., R.F.D. No. 2

RHEA BROTHERS

ACCLIMATED PERCHERONS

We have 40 head of stallions on hand today. Ages from coming two to five years. The older horses weigh from 1,900 to 2,200 pounds and are not loaded down with fat.

These stallions have been raised in the open fields and are acclimated and will breed from the start. You cannot over-estimate the importance of acclimation—it means much to you.

Our horses have more bone than is usually found among Percherons, and they are clean jointed and sound.

We are offering stallions at very reasonable prices, far below what the same class of horses are usually quoted; but we raise them here on the farm; raise our feed and can afford to sell cheaper than others not so favorably situated.

Every stallion fully guaranteed. Life insurance furnished at cost if desired. If interested in Percherons we ask you to come and see us or write today. References—Packers Nat'l Bank, So. Omaha; Arlington State and First Nat'l Bank of Arlington, and the Citizens State Bank of Blair, Neb.

Arlington is on the main line of C. & N. W. R. R., 34 miles northwest of Omaha, 55 miles north of Lincoln, and eight miles east of Fremont. We have 12 passenger trains every day. *ARLINGTON, NEBRASKA*

PERCHERON STALLION

For sale. High bred grade, coming 3 years old; weight 1750 pounds. Will sell or trade. **Olson Bros., Assaria, Saline County, Kas.**

STALLIONS AND MARES

For sale. Three young black, registered Percheron mares; 1 bay stallion, registered, 17 months old; 1 black stallion, registered, 6 months old. **T. H. Terry, Bavaria, Saline County, Kas.**

PERCHERON
AND FRENCH DRAFT

Stallions for sale. 7 head of extra good stallions, two to five years old; weight 1600 to 2260 pounds. The good kind at farmers' prices.

FOR SALE OR EXCHANGE.

For land or standard bred mares, one black Percheron; 5 years old; sound; registered P. S. A.; stood one season; kind and well broken; sure and good breeder; weight 1,850 pounds. One black Percheron 15/16; four years; sound; 1,800 pounds.

These colts are right in every way but on account of sickness I must dispose of them at once, regardless of price. **A. B. Like, Blue Earth, Faribault County, Minn.**

PERCHERONS

Eight home-grown stallions, the "Big Type," 2 to 5 years old, ready for heavy service. Also weanlings and yearlings. Bargains. South Central Iowa. Fast trains. **Fred Chandler, Route 7, Charlton, Iowa.**

Some cases are much more pronounced than others.

ILL DISPOSITION — Some people claim it does not make any difference in the colt's disposition (about being ill natured) if the sire is allowed to get in a fight with other stallions occasionally. Will it not have a tendency to make the colt more cross and ill-natured?—Missouri Subscriber.

REPLY—The disposition of parents is transmitted to their offspring the same as other characteristics, and we should expect a stallion of an ill nature to beget many colts of that kind. Why permit stallions to engage in fights such as you suggest. It occurs to us that such practice must result from carelessness or gross ignorance.

SHY BREEDING STALLION—I have a seven year old Percheron stallion in good shape and to all appearance perfectly healthy, that I got at the beginning of the season last year. He is very prompt getting ready—almost too soon. I found that he did not settle the mares as he should, and I soon discovered that he did not spend, that is, deposit any semen. I bred him but very little the rest of the season and have taken good care of him, and now I find him in the same condition. He seems to be sure when he does discharge. What is the matter with him and what can I do for him?—Nebraska Subscriber.

REPLY—We would advise giving this stallion plenty of exercise, either at work or on the road. Begin with one mile the first day and increase a mile a day until he is traveling at least ten miles a day. Do not use him as a teaser. Watch him very carefully to see that he is not masturbating. If this does not give you good results diminish his grain ration. Get a mare that is in good heat and turn them loose together until he makes a discharge. Be very careful that he does not get too warm. Examine his semen with a microscope occasionally. Increase the service gradually; only try to make about one service a day with this horse.

CAPPED HOCK—Will you inform me how to take off a badly capped hock of about 15 months' standing, on a three year old filly? She did it kicking at a log. Have applied different liniments without any improvement. —Oregon Subscriber.

REPLY—There is nothing that you can apply to the hock at this time that will remove a growth of 15 months' standing. Your only relief lies in having some skilled surgeon dissect out the growth and this should only be undertaken in a valuable animal.

TOO MANY SERVICES—I have an imported English Shire horse and last season after I had bred about 30 mares, got to coming off proud and did not seem to discharge semen. He appeared to be in the best of condition in every way. Runs in an open corral day and night. Was fed on oats, bran, prairie hay and corn fodder, with a small amount of alfalfa. After he was idle a few days he was all right again, but spoiled the season. I never bred but two mares a day and only six days in a week. I would be pleased to have your advice what to do for this horse that I may get better results this year. The horse is very quiet and a little slow, but always gets ready, enters and works hard, but soon gives up and comes off; sometimes he will work all right by letting him on the second time.—Nebraska Subscriber.

REPLY—You have one of those effeminate stallions that cannot stand so many services. If you would limit this stallion to one service a day, you would not have any difficulty with him. If you will breed one good, clean, healthy mare every evening through the entire season, and refuse all diseased or doubtful mares, you will probably get more colts than you will to breed two mares a day with this horse and breed all the mares that come. If you will have postal cards printed and sent to all your customers stating that you will breed at four o'clock in the evening, or some special hour suited to your locality, you can adopt the capsule system very nicely with this horse and be an advantage to you as well as your customers.

SEE OUR STALLIONS

BEFORE YOU BUY.

Percheron, Belgian and German Coach.

Our last importation arrived December 28. These with the select lot on hand enable us to offer for inspection at this time a great collection of stallions of strong individuality, rare quality and standard breed types. **There are yours at bed rock prices. OUR GUARANTEE is different to that offered by any other firm.** It will pay you to investigate it if you contemplate the purchase of a stallion.

Mention American Breeder when you write.

OLTMANNS BROS., Watseka, Ill.

Leer, Germany; N. Ft. Worth, Texas.

IMPORTED PERCHERONS AND BELGIANS

I have a lot of the best specimens of the two leading breeds. I have personally selected them carefully for big bone, with quality, style, action and breeding, with weight from 1800 to 2200 pounds. I give a gilt edge guarantee, good for two years, with every horse. I am going to sell them down very cheap, considering the quality. Barns are four blocks from A. T. & S. F. depot.

W. H. RICHARDS, D. V. S.

EMPORIA, KANSAS

WHITE OAK STOCK FARM

American bred Percheron Stallions and Mares.

The best to be had of the breeder—can show sires and dams of most of them. Always a large number to select from at reasonable prices, considering the kind of stock. Address your wants to **D. Augstin, Carlock, Ill. R. F. D. No. 2.**

Carlock is on the L. E. & W. Ry., and thirty miles southeast of Peoria, ten miles northwest of Bloomington, Illinois.

LINE BREEDING—I have a 15/16th Percheron mare; weighs 1,650 pounds and a full blood Percheron horse, weighs 1,800 pounds. They are from the same sire. Would you mate them or breed them or breed her to my one-fourth Morgan, three-fourth Percheron stallion? The reason I ask this, there is not another full blood Percheron that I know of in this county except her half brother and her sire.—Oklahoma Subscriber.

REPLY—If both animals and their sires are free from all transmissible weaknesses, this union may be made successfully. If there is a defect in either of these animals or their sire, it will be intensified just as quickly as some of the good qualities. It would be better in this case, at least, to take a chance on the pure bred Percheron stallion.

PERCHERON WITH LONG HAIR—How should one be able to tell a Percheron from a cross between a Percheron and a Shire. I know of a horse that has almost as much hair on his legs as a Shire, that is advertised as a registered Percheron, registered in the Percheron Registry, giving his number. I never knew that a Percheron had long hair on his legs.—Missouri Subscriber.

REPLY—There are a few pure bred Percherons that have an abundance of hair on the legs. This is not common, however, to the Percheron breed.

STARTING TO RAISE PERCHERONS—I would like to know whether you think it practical or not for a man with limited means, say $6,000, to start in the business of breeding full blood Percheron horses? If a success could be made with that capital, what working plans would you advise for the first few years or until something would be old enough to sell?—Washington Subscriber.

REPLY—Success, as a breeder, would depend largely on the individual. There is much work connected with a successful career of this kind. We suppose you are a farmer, or at least this is the most successful way of raising pure bred stock. The principal outlay is for feed after the foundation has been purchased. A small number of extra good mares may build you a large business in a few years, if you sell off the stallions

BLACK PERCHERON STALLION

For sale. Coming four years old; registered in P. S. of A. Extra heavy bone; a low down, blocky horse; stands up straight on his limbs; good back and rump, and a prize winner. Broke to work, and easy to handle; weight 1750 and will make a 1900 pound horse when matured. Is an 80 per cent breeder; sound and right in every way. Price $750 if taken soon.

Would consider a trade for an extra good jack, or will pay cash for one. Must weigh 1000 pounds or better. Prefer 1100 or 1200 pound jack. Give good description and lowest cash price in first letter. **C. H. Wempe, Seneca, Nemaha County, Kas.**

IMPORTED AND HOME BRED STALLIONS AND MARES.

PERCHERONS, BELGIANS, SHIRES.

The best importation we ever made is now in our barns ready for inspection. The mares include some of the best fillies that came out of the Perche this year. See what we have before buying elsewhere. **Address Hart Bros., Osceola, Iowa.**

SOME VERY CHOICE DRAFTERS.

Ranging in age from six to eight years old; weigh from 1800 to 2100, and ready to sell. **Chas. Piper, Buckingham, Kankakee County, Ill.**

J. C. HUCKSTEP, Eolia, Pike County, Mo.

GRANDVIEW JACK FARM.

JACKS AND PERCHERON STALLIONS

Best lot of jacks ever offered at Quiet Glenn; the big kind with herd headers among them a specialty. Buy this fall, get choice and save money. — G. M. SCOTT, Rea, Andrew County, Mo.

REGISTERING PERCHERON HORSES—What are the qualifications for registering Percherons in the United States?—Washington Subscriber.

REPLY—Write to Wayne Dinsmore, secretary of the Percheron Society of America, Chicago, Ill., or John Forney, secretary of the American Importers and Breeders' Association, Plainfield, Ohio, for rules. These are the only important associations.

JENNETS HARD TO SETTLE—Can you tell me the cause of jennets being so hard to get in foal by a horse? I have tried capsules, impregnator and natural service. Is there any germ that would make them barren? If so, what can I do for them?—New Mexico Subscriber.

REPLY—If you will select jennets that are successful producers from a jack, you should not have much more difficulty in fertilizing them to a stallion. One of the greatest difficulties in breeding jennets is that they are in heat more frequently while pregnant than mares; as a result of these signs they are frequently opened up, which causes an abortion. There is a germ that we call the "germ of barrenness," which is probably more prevalent in jennets than in mares. If you will follow out the instructions in capsule breeding as we have printed them, you should have good results in breeding jennets to a stallion.

CATCHING THE SEMEN—As I have been in the breeding business for some time, and have used the impregnator with some success, I would like to know how to get the semen each and every time without a failure. The more mares that I have lined up the more sure I am not to get any semen. I remember one time when I had mares galore in heat, and was expecting to make a big hit, I picked out the mare the horse would cover (it was a good gentle one). The horse made the cover all right and before he was off of the mare the semen was all on the ground. How could I breed the other mares? It was not the stallion's fault. I bred a nice big young mare yesterday which I did not get in foal last year. It is about ten inches to her womb, and when I breed her she will hump her back and throw out the semen before the stallion is off of her. How can I get semen from this mare, or any that does the same way? I can use either impregnator or capsules if I can get the semen.—Iowa Subscriber.

REPLY—If you will select clean, healthy mares in a breeding condition, and your stallion is a good server, the semen is not liable to be withdrawn. In case it is withdrawn, you should have a bowl which should not be white on the inside, to catch the semen. This bowl should be sterilized before it is used and one should be able to catch the semen in case it is spilled. Take your position beside the stallion on the left hand side. After a little practice this will be very easy. If the semen is deposited in the vagina or the uterus the Carlson Semen Extractor can be used successfully for this purpose.

RESERVING MARES—Would it be worth while to let horse serve a mare the fourth time if she did not settle in three times?—North Dakota Subscriber.

REPLY—Evidently you have been wasting numerous services which have cost you money and the owner of the mare a lot of time. If you could get the owners of these doubtful mares to wait until the last of June, much better results would follow. Mares are in a better candition to breed at that time, as they are more settled and familiar with work. There are a few mares that may be bred regularly for a number of services and settle at a later service. This is evidence that one of the animals is not in perfect order at the beginning. A microscope will settle this argument as far as the stallion is concerned.

MULE RAISING ON THE RANGE.

To the American Breeder: I read an article in the February 20th issue in answer to an inquiry from an Illinois man in regard to raising mules in Montana. If this man could bring out some good, gentle farm mares to this country, he undoubtedly could raise some mules.

There has been more money lost here in Montana trying to raise mules from native mares than in any other way, not excepting the severe losses from the hard winters. The writer came to Montana about thirteen years ago and brought a few mares from Nebraska and a jack. The jack was then bred to some native range mares. The farm mares raised mules fairly well; the others did not. After three years, and breeding 25 mares each year, we had 12 mules to sell. Some might say the jack was not acclimated the first year. Our percentage of colts was the same the first year as

SIX JACKS, SEVEN JENNETS

For sale. All blacks; registered; priced at a bargain for the lot or will sell one at a time, or any part. **Bert Fry, Plainfield, Bremer County, Ia.**

20 JACKS.

W. J. Finley, Higginsville, Mo.

55 Miles East of Kansas City on C. & A. R. R.

the last. I could cite other breeders who tried but with the same results. I have a neighbor who has been using jacks and breeding about 50 mares for the past four years. He has some 36 mules from one to three years; last year not one. I have always thought that if a breeder had a bunch of mares out here all perfectly gentle, and gave his entire attention to these mares, and a good jack, that he could raise mules. I am positive that there is not a single instance in the West where mules are successfully raised unless by the above plan.

By far the best way for this man to find a location is to go out himself and look the country over. Anywhere in the eastern half of the state he can find plenty of ranches already improved and can almost always buy one cheaper than to take up land and improve it himself. He can buy a ranch and then possibly can take up some government land adjoining to make additional pasturage. If one expects to raise grain to feed young stock, there is the difficulty to get enough land fenced to pasture the stock. This is a somewhat lengthy explanation of this man's problem, but if he takes this advice he will have no kick coming later. I haven't any ranches to sell myself. — Waite Bros., Custer County, Mont.

FOUR JACKS

For sale; ages 2 to 7; all black, white points; big bone; heavy body, head and ears. The kind that will do any man good. Will sell cheap as I am crowded for room. **J. I. Williams, Winthrop, Buchanan County, Iowa.**

JACKS AND PERCHERONS.

25 biggest and best Mammoth jacks in Ky. Few Percheron stallions. Price cut from $100 to $300 on every one. Big stock high grade Percheron mares, Hampshire and Large Black swine. **H. T. Brown & Co., Lexington, Ky.**

JACKS.

20 good black jacks and some good jennets; coming 3 to coming 8 years old. Large, heavy boned, broken to mares and prompt servers. Prices reasonable. Come and see me. Barns 2 miles from town.

Phil Walker, Moline, Elk County, Kas.

CLOSING OUT SALE.

Two black jacks, three years old; 14½ hands; sired by imported Black Hawk, dam by Gladstone Jr.; $400 and $500; terms if necessary.

Also 16 hand Saddle Stallion at sacrifice to close barn for season. **Kentucky Sales Stables, Fort Smith, Ark.**

JACKS AND JENNETS.

Forty head of Mammoth jacks and jennets for sale. Jacks in age from colts to four years old; in size up to 16 hands. These jacks are all good ones; in this lot are two as good as grows—good enough to head any herd of jennets. I have one of the best herds of jennets in Kentucky. I raise all my own stock and will sell them worth the money. Write for prices today, or better, come and see them. U. G. Saunders, Flemingsburg, Ky.

JACKS AND MULES

We have 14 jacks from one to six years old; have lots of bone, size and quality; all black with white points.

Also have 128 yearling mules, coming two year old, and 26 mule colts These mules are from grade draft mares; have lots of bone and width. Only 15 out of the 154 are horse mules, the balance are mare mules. Will sell at reasonable prices. Scott, Abney & Jenkins, Virden, Macoupin County, Ill.

HORSE AND MULE TWINS.

To the American Breeder: Noticing your article on page 9, March 5, regarding twins, mule and horse, I will give you my experience. Two years ago I had a mare that failed to get in foal in August. I bred her then to my jack and some two or three weeks later I was feeding my stallion in the pasture when the mare came up to me. She was in heat so I let the horse cover her. The result was a mule fully developed and a horse which looked to be about a month before its time. Both were dead but in separate envelopes. They were foaled in the livery barn at this place and kept on exhibition one day. I had heard of such cases but did not believe it, but it happened as I have written you.—M. O. Davis, McPherson County, Kas.

CERTAINLY A BIG ONE THIS TIME.

To the American Breeder: I will give measurements of what I call a good jack colt raised by me and sold to W. B. Burchett. Foaled August 8, 1911; 15 hands high, standard measure; heart girth 69 inches; flank girth 71 inches; forearm 21 inches; knee 16 inches; cannon bone 8½ inches; hind leg 9 inches; tip to tip of ear 32 inches; from lip to root of tail 8 feet 10 inches; weight at 18 months 700 pounds.—W. C. Robbins, Republic County, Kas.

SOMETHING TO THINK ABOUT HERE.

To the American Breeder: You ask for short articles as to the cause of so many slow jacks. You often hear of some one asking for a slow jack to breed jennets to. If people would quit using slow jacks on their jennets, a slow jack would soon be a thing of the past. If you breed a jennet to a good jack, you expect a good jack, and just as sure as you breed a jennet to a slow jack you may expect a slow jack. I would not breed a jennet to a slow jack at all. Some talk about jacks being jennet spoilt. They inherit the slowness from their ancestors.—T. E. Collins, Republic County, Kas.

WE WANT 5,000 MORE LIKE THIS.

To the American Breeder: . Have read and studied well your article on "Study Horse Breeding at Home," and say to you it will be one of the grandest things you have yet accomplished, for there are hundreds so placed that they cannot attend school and who would only be too glad to take your paper for just that alone. I am with you heart and soul and will give you my hearty support. I will get all the subscribers I can whether that is one or one hundred. I certainly believe in scientific breeding in all kinds of stock or poultry. I am just starting in to breed pure bred Percherons.—F. W. Mottner, Bonner County, Idaho.

GOOD START FOR CAPSULES.

To the American Breeder: I see an inquiry in your paper from an Illinois subscriber about jennet breeding and will make a report of my success breeding jennets with capsules. I bred 14 head last summer and after examining them pronounced nine with foal but the owner tells me that he is sure of ten and a chance for more, as I did not get a chance to examine the last four bred. I bred them to a Percheron horse. Will breed them again this year.—J. K. Hastie, Eddy County, New Mexico.

RECEIVED NEAR FIFTY LETTERS.

To the American Breeder: Please stop my advertisement in the American Breeder. I have received near fifty letters so far.—O. J. Rhoades, Jackson County, Mo.

MARE 24 YEARS, CARRYING HER TWENTIETH COLT.

To the American Breeder: I want to give you the record of two mares in our neighborhood. One is a bay mare 16 hands and weighing about 1200. She is with foal for her eighth colt; they have sold from $150 at maturity to $250. Another is a mare belonging to W. E. Shepherd of Rolla, Mo. I have his word for this record. She is 15 hands high, has raised 16 hand mules and horses; she is 24 years old this spring and is with foal by my saddle stallion, Hutchings 2998. We bred her once last June when her colt was nine days old and she was not returned. A few days ago Mr. Shepherd offered me $12 for his chances on getting a living colt (my price is $15). She has raised nine mules and this one will be her eleventh horse colt if it lives. About ten years ago Mr. Shepherd offered her for sale and was only offered $20 for her. Her colts have sold as high as $200 for mules to go on the market and $250 for mature mares from her. The mare is as sound as a dollar except one eye has been out for ten or twelve years as the result of an accident. He has a granddaughter of this mare that will be 3 this spring and he refused several offers of $200 and $210 for her. Her dam, the daughter of the old mare, is with foal for her ninth colt and is going to be 12 this spring. How is this for anti-race suicide?—J. H. Bowen, Phelps County, Missouri.

KING A., ONE OF OUR STUD JACKS.

Our Trade Has Been the Best Ever Enjoyed, but we Still Have Some Extra Good Jacks For Sale. We Probably Keep More Good Ready-to-Use Jacks Than Any Other Firm in Missouri.—Bradley Bros., Warrensburg, Mo.—Adv.

This Pony Free

To Some Lucky Boy or Girl

"SULTAN"

"Sultan" is a beautiful cream colored pony with black points, about 40 inches tall and weighs close to 300 pounds. You seldom see a pony like him except in a circus or a pony show; in fact we were lucky to get a pony like **"Sultan."** We selected him from over 100 ponies at the famous Heyl Pony Farm at Washington, Ill. and we think he is undoubtedly the finest pony of all the 85 we have given away. You would be the happiest child in the United States if you were the proud owner of **"Sultan."** Just think of the fine times you could have taking your boy and girl friends out riding in his nobby pony wagon and when you did not wish to drive him you could go for a horseback ride early in the morning. But best of all **"Sultan"** is as kind and gentle as a kitten and dearly loves children. You can teach him all kinds of cute tricks, such as, to come when you whistle, stand with his front feet on a chair and many others. Didn't you ever notice what dandy times children have who own ponies and how pretty these cute little fellows look when trotting up the road? Everybody runs to the door and stops to look at a Shetland pony going by. If you think you would like to own **"Sultan,"** read the rest of this page carefully and then send us your name so we can tell you how you may get him.

WE WILL GIVE YOU OR SOME OTHER BOY OR GIRL THIS PONY WITH COMPLETE OUTFIT JUST AS IT LOOKS HERE

THE OUTFIT

And best of all we send free with **"Sultan"** the complete Pony Outfit just as you see it in the picture. Besides the Pony, the Pony Buggy and the Harness shown we send a Saddle and Bridle, which would make you the most complete outfit that money could buy. You could ride horse-back or take all your boy or girl friends driving everywhere. The Pony Wagon is just the most comfortable riding and easiest pulling we could buy for our purpose. We have given away so many that we know exactly what kind most boys and girls like. The handsome nickel trimmed harness looks just fine and the riding bridle is imported and the saddle which we also send we had made to order for **"Sultan."** No child, no matter how rich his parents may be, owns a nobbier or more desirable pony and outfit than this one which we shall send free with all freight and express charges paid. Read down below what some of our pony winners say about their ponies and outfits—how proud and happy they are—and see if it doesn't make you want one, too. This is surely the best chance you ever had to get a Shetland Pony, so if you haven't any and think you would like to have us give you **"Sultan,"** send your name and address to us right now so it will get to us quickly.

Send Us Your Name Today

If You Want to Own "Sultan"

As soon as we hear from you we will tell you how to become a contestant for "SULTAN." Notice we print the names and pictures of 4 of our 85 Lucky Pony Winners, which shows that we really do give away Live Sheland Ponies. Furthermore we will give you the names and addresses of any of our 85 Lucky Pony Winners that you ask for. The Webb Publishing Company publishes The Farmer's Wife and The Farmer. The banker or postmaster in your town knows we are one of the largest publishing houses in the United States, established for 30 years, so we can well afford to give Ponies to boys and girls to advertise our papers. And right here we want to tell you that we have a BIG SURPRISE for you that will DOUBLE YOUR CHANCES of winning a pony. We haven't room to explain it here, but we will tell you AS SOON AS WE HEAR FROM YOU. Remember, you can't win "SULTAN" till you send us your name, so sit down and write us at once. Don't miss this opportunity to get a dandy pony free.

We Have Already Given Away 85 Ponies and Outfits

Here are pictures of some of our 85 Lucky Pony Winners and what they say about the Ponies we gave them

"I have the dearest little black Shetland Pony named 'Jerry' which The Farmer's Wife sent me free all the way from St. Paul up in Minnesota out here to Lawrence, Kan.

"When I first started out to get my friends to help me win a pony, some of

"Jerry," Cleta Johnson, Douglas Co., Kansas.

them laughed at me and made fun of me and said: 'Oh, you can't win a pony.' However, I now have 'Jerry' as proof that the company did as they agreed.

"I took 'Jerry' down to the Douglas County Fair at Lawrence, Kansas, and he took the first prize of $6.00 in cash over all the ponies there. When they tied the blue ribbon on 'Jerry' he acted e proud than ever." Ever your nd, Cleta Johnson.

"Jewel," Arthur Marode, Douglas Co., Nebraska.

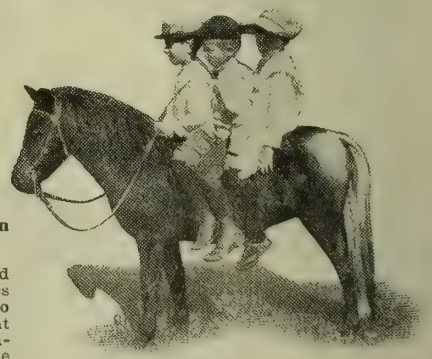
"When I started out to win 'Jewel' everyone said I would never win a pony; nothing but a wooden horse. Some one said I would get a stuffed pony and an express wagon while others said I would only get a piece of his tail. But. I kept right at it and won "Jewel."

"'Jewel' likes apples, candy, cake, cookies and in fact anything children like. He also can do tricks: shake hands, put his front feet on chairs, and shake his head for yes or no. My buggy, harness, saddle and bridle are of the very best material and I certainly appreciate them very much. I would not sell 'Jewel' for any price. I thank The Webb Pub. Co. for him.

Your little friend, Arthur Marode.

"Duke," Dorothy Lee Eagle, Jackson Co., Missouri.

"We have taken our first ride behind 'Duke' and cannot find words to express our pride and thanks to you for so beautiful an outfit. He is the excitement of the whole town and people are constantly coming to see if it is really true and all go away most agreeably surprised.



"Each day we all love 'Duke' more and more, and are having many pleasant rides, in fact, we are very much acquainted with each other.

"Wishing a long life and prosperity to your nice magazine and with many thanks for your kind and generous treatment, I am,

Ever your friend, Dorothy Lee Eagle.

I want to tell you about my pony 'Sonny,' which The Webb Publishing Company, publishers of The Farmer's Wife, gave me. 'Sonny' is the finest pony in these parts and he and his outfit are better than $500 to me.

"I went to the depot to meet my pony

"Sonny," Elmer Hoth, Allamakee Co., Iowa.

the day he came. I could hear him whinnying, but could not see him. Then I saw him in a little crate in the express car, and I was so happy I couldn't talk.

"I have lots of good fun with 'Sonny' and no money could buy him. He goes as fast as he can when we go after the cows at night. I am never going to sell him, and 'Sonny' is so good he makes me feel happy all the time." Your little friend, Elmer Hoth.

..ERY CONTESTANT A PRIZE WINNER

..ll contestants will surely get a prize .. their own choosing from a list which will send you. Beside the Pony Outand Twenty-five Grand Prizes we ll offer Gold Watches, Base Ball Out- Gold Bracelets, Fountain Pens, Hand l. Flash Lights, Rifles, Shot Guns and .l zens of other desirable prizes. If you become an enrolled contestant in this ..ny Contest you can't lose, but you can win "Sultan" if you write us.

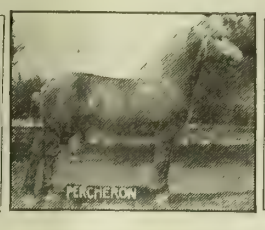
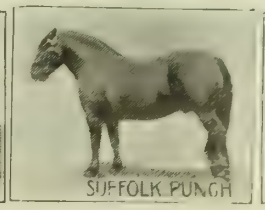
THE AMERICAN BREEDER

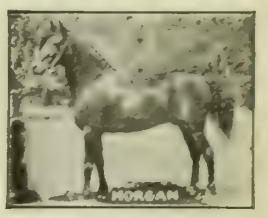
A Farmers' Paper, Devoted to the Breeding and Care of Their Live Stock, and the Welfare of Their Families and Homes.



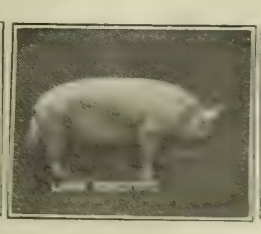
Published Twice a Month. Subscription Price, $1.00 Per Year, or $2.00 for Three Years, Payable in Advance.



Volume VI. *Kansas City, Missouri, April 20, 1913* *Number 7*



A Stallion That Is Bothered By Scrubs.



The owner of this stallion sent us this photograph, and a letter stating that he is not getting the business that his horse deserves. Here is a 2,200 pound mature Percheron, a good breeder, and a good horse, as the picture shows. He cost nearly $1,200 cash, and stands at $15 to insure, yet he has to divide patronage with a half dozen scrub stallions in the same neighborhood that stand at from $6.00 to $10. The owner of this horse wants to know the reason. We turned to our subscription list for the answer. In this man's neighborhood, four men beside himself, are reading the American Breeder. In some neighborhoods, from which our subscribers write that the scrub stallions have almost entirely disappeared, we have as high as 60 good farmers (mare owners) on our list.

It has always been our belief (and that belief is one of the foundation stones of our business), that a man who reads the American Breeder will not continue to patronize a scrub of any kind. These men who keep on breeding to inferior stallions, when a few dollars more will give them the service of a stallion like this one, are not reading the right kind of papers—if they read at all. If this man will do as thousands of owners of good stallions are doing throughout the country—see that all the good farmers of his community know what the American Breeder is and have a chance to subscribe through him at our special clubbing rates (see page 3), he will find that they soon learn to appreciate the advantage of breeding to the right kind.

Graham Publishing Company, Inc., 225 West Twelfth St., Kansas City, Missouri

TRUMANS' CHAMPION STUD

78 SHIRE- PERCHERON AND BELGIAN STALLIONS

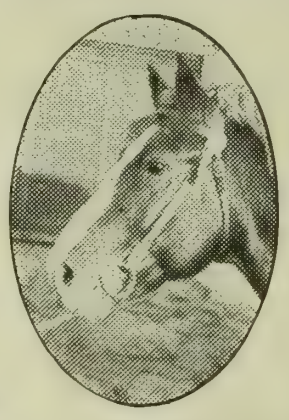
Let the Above Illustration Prove to You that We Import Stallions Bred to Sire the Right Kind and Sell Them in Condition to Produce.

NEW, FRESH STOCK IS OUR SPECIALTY AT ALL TIMES OF THE YEAR—WE NEVER MAKE A "PICKED OVER" OFFERING.

We landed a new importation in February, another one in March and another, landed April 10, is just ready to show.

If we didn't make our prices right, do you suppose we could clean up one importation after another as we do? We cordially invite every horseman to come and judge for himself.

IMPORTED SHIRE AND PERCHERON MARES ALWAYS FOR SALE.



(Send for our new catalog and be sure to mention the American-Breeder.)

TRUMANS' PIONEER STUD FARM, Bushnell, Ill.

BELGIUM EMPORIUM OF AMERICA

150—Head Stallions, Mares and Colts—150.

Including a few choice Percherons; 60 stallions imported October, 1912, and another **Large Importation of Stallions** arrived in March, 1913, enabling me to continue saying that I have **the largest collection of Belgian Draft Horses to be found anywhere in America.** The supply on hand never allowed to run low; you will at all times find a large and choice lot from which to make a selection. You will be delighted at the Belgian Horse Show to which you will be treated while here. I can satisfy you in price; I can satisfy you in quality; Bays, Browns, Blacks, Sorrels and Roans.

Get on the train, come to Cedar Rapids or Iowa City, then phone me at Fairfax to have team or auto meet you at electric car line. Car every hour from Cedar Rapids and from Iowa City. Catalogue ready. Farms two miles from Fairfax; three miles from electric car line.

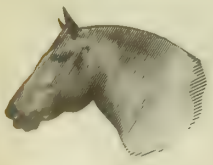
H. LEFEBURE,

Fairfax -o- Linn County -o- Iowa

SEE OUR STALLIONS

BEFORE YOU BUY.

Percheron, Belgian and German Coach.



Our last importation arrived December 28. These with the select lot on hand enable us to offer for inspection at this time a great collection of stallions of strong individuality, rare quality and standard breed types. **There are yours at bed rock prices. OUR GUARANTEE is different** to that **offered by any other firm.** It will pay you to investigate it if you contemplate the purchase of a stallion.

Mention American Breeder when you write.

OLTMANNS BROS., Watseka, Ill.
Leer, Germany; N. Ft. Worth, Texas.

"AMERICAN BRED PERCHERONS"

Anthon 25137 (45446) by Besique (19602), at head of herd. We have on hand several fillies and stud colts sired by Gouveneur 55323 (70200), for sale. Also a black stallion of fine quality coming three years old in July, for sale. Come and get a colt where you can see the sire and dam. Onarga is eighty-four miles south of Chicago on the I. C. R. R., and about seventy-five miles east of Peoria.

H. KNOCHE & SONS, Onarga, Ill., R.F.D. No. 2

HOMEWOOD STOCK FARM

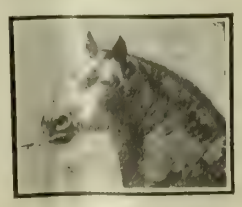
Percheron, Belgian, Shire Stallions and Mares

Now is the time to buy a good stallion or mare. We have the kind you have been looking for. Our horses arrived home in October and are now perfectly acclimated and in the best of condition to do you a lot of good.

The Percherons are two and three years old, with size, bone and draft horse quality—many of them weighing over a ton, and not fat.

Our mares are of the best brood type; all are in foal and plenty of ton mares to select from. Every animal guaranteed sound, and a satisfactory breeder. Others say we have the best bunch of two-year-old Percherons they ever saw; you will say the same. Come and see us or write for full particulars. You will find horses right, terms right and prices below others of equal merit. We have also a lot of big, heavy boned, American bred stallions at surprisingly low prices. Don't buy until you have seen our stock.

Homewood is on the main line of the Big Four and I. C. R. R., twenty-three miles south of Chicago. Trains hourly to and from the city.



S. METZ & SONS, Bell Phone, Homewood 58 W. Homewood, Ill.

Galbraith's Percherons

Are of the same high standard as the Clydesdales which have made the name famous.

During the month of April especially low figures will be quoted on all the stock on hand, including a number of extra big, good boned, imported black Percherons, with quality and conformation. Address or call on

Alex. Galbraith & Son, De Kalb, Ill.

WHITE OAK STOCK FARM

American bred Percheron Stallions and Mares.

The best to be had of the breeder—can show sires and dams of most of them. Always a large number to select from at reasonable prices, considering the kind of stock. Address your wants to **D. Augstin, Carlock, Ill. R. F. D. No. 2.**

Carlock is on the L. E. & W. Ry., and thirty miles southeast of Peoria, ten miles northwest of Bloomington, Illinois.

SILO SERVICE; HOW TO GET IT

Necessary Silo Equipment For Different Sized Herds. Essentials In Building Either Stave or Concrete Silos. Value of Silage Compared With Other Foods.

By Prof. H. S. Hine, Kansas Agricultural College.

The immense demand for the silo was largely brought about by the increased values in farm land and forage crops. Throughout the state thousands of acres of corn stalks are left standing in the fields. In many instances these stalks are cut and burned, while under other conditions they simply blow away. When we consider that the stalks represent one-third of the actual feeding value of the corn crop, and this crop in Kansas, grain alone considered, is valued at $59,599,408.03, the great possibilities of the silo may be realized in a small degree. The stalks represent a value of $20,000,000.00, and where these stalks are placed in a silo the feeding value is increased 40 per cent over and above that of the stalks fed in the form of fodder, due to the fact that the whole stalk is converted into an available form of feed. Thus, if all the corn stalks of Kansas were placed in the silo, they would have an increased valuation of $8,000,000.00 over and above that of stalks fed in the form of shock fodder, while compared with pastured stalks the increased feeding value if same are placed in the silo, is 80 per cent, or $16,000,000.00, in the state as a whole. The above mentioned facts would indicate that the general tendency of the Kansas farmer will be rather to increase the number of silos erected and thus reduce the losses of forage crops to the minimum.

The average man is often of the opinion that the silo is a new sort of storage plant, discovered only within the last decade. Such an idea is erroneous. History indicates that the silo dates back to Persian and Roman times, when grain forage crops were stored in pits. To M. Goffart, of France, however, belongs the honor of erecting the first air tight structure above ground for the storage of green crops. The first silo was built in America in 1876 by Mr. Morris, of Maryland.

Since the first silo was constructed there has been considerable change in the method of erecting. Some of the factors causing these changes are, a desire to decrease loss of stored feed by decay and decrease cost of construction.

With these two points in mind, the silos in use at the present time have been evolved. Some of the factors which must be given special attention, if the silage is to be stored with a minimum loss, are:

(1) The base and walls of the silo must be absolutely impervious to air.

(2) The walls of the silo should be perpendicular and as smooth as possible to offer the minimum amount of friction to the settling silage.

(3) The silo must be of a height such that the silage will be subjected to a sufficient amount of pressure.

The last point has caused the most noticeable changes of late years, and where formerly silos were erected from twenty to twenty-eight feet in height we now find that the tendency is to construct them thirty-five feet in height, and, in fact, I know of several as high as sixty feet.

In selecting a silo the first point which should be taken into consideration by the party contemplating the purchase, is whether or not his herd is of sufficient size to warrant the expenditure of the necessary purchase price. A man should have at least twelve head of stock to warrant the erection of a silo.

Next to be considered is the size of silo necessary for a given herd. This is a point of considerable importance, and must be carefully considered. Do not think that if a small silo is a good thing, a large one is a whole lot better, for such may not prove to be the case. The silo is an immense can, the purpose of which is to preserve in the form of a green succulent feed the forage crops produced on the farm. As such is the case, the green feed placed in the silo must be protected from the air. The sides and bottom will take care of themselves, but the top must be protected. When this portion is covered in some manner the desired protection will be procured, but as soon as we uncover it in order to feed the silage the top layer will again be exposed to the air. The method of obviating this difficulty is to construct a silo of such diameter that the animals to be fed will consume the amount of silage contained in a layer two inches in thickness, removed from the entire surface of the silo. Thus, for a herd of from twelve to twenty head of stock, a silo twelve feet in diameter would prove a satisfactory size, while from twenty to twenty-five animals would be better accommodated by a silo fourteen feet in diameter, and herds numbering from twenty-five to forty head a silo sixteen feet in diameter.

When the size of the herd is thus proportioned, it is possible to feed at least two inches from the surface of the silo each day. This results in the exposure of an entirely new layer of silage each day. Silage will not ordinarily spoil until exposed to the air for a period of forty-eight hours. Thus, by feeding daily a layer from the surface of the silo we are able to effectually preserve the silage. When the silo has too large a surface area for the herd fed, spoiled silage is bound to result.

The next point to be considered is the necessary height of the silo. This may readily be determined by the contemplative builder. If he expects to feed at the rate of two inches per day for a period of 180 days, the desired height of the column of silage would be two times 180, or 360 inches, or thirty feet. Thus a column of silage thirty feet in height will last through a feeding period of one hundred and eighty days, provided that no more or no less than two inches per day is fed.

If one is convinced that the silo is a necessary building on the farm and has figured out the size required to accommodate the herd he contemplates feeding, the next question to answer is, "What type of silo shall he erect?" This is a question which everyone must answer for himself. Before deciding, however, it is well to get all the reliable information possible regarding the various types. There are many firms manufacturing the stave type of silo, and each particular type has some special feature of its own. One general point may be kept in mind, however, regardless of the type purchased, and that point is, that it is better to purchase a single piece stave, and preferably a stave of Oregon fir. When the silo is delivered the most important thing is to set same up properly.

First, the foundation should be constructed. When desired, provided that drainage conditions will permit, it is preferable to have the foundations extend four feet below the surface of the earth. When this plan is followed the footing is not affected in the least by the various weather conditions to which it may be subjected. Then, too, this foundation will act as a portion of the silo proper. This gives an added four feet to the silo. Also, in removing silage the last few inches of same is the only portion of the feed which must be lifted, and that only to a height of four feet. Said foundation should also extend some six inches or a foot above ground. This keeps the staves well away from the ground.

After the foundation has been filled in to the desired height, a slight groove should be cast near the inner surface of same and eye bolts should be imbedded in the concrete so as to enable the owner to fasten the base of staves to the foundation. Care should be taken to make sure that the diameter of the foundation in the clear is but three inches less than the inside diameter of the stave portion of the silo. Thus when staves are set up, there will be a one and one-half inch shoulder. This allows for the shrinkage of staves after the silo is emptied.

The foundation completed [illegible] time to get staves in readiness for erection. The groove in foundation should be filled either with pitch or tar and the staves set in same. The purpose of this is to thoroughly protect the base of staves in the prescribed manner is which may exude from the silage, as well as any water from the outside. The staves should be treated on the inner surface, at least, with a mixture of creosote or oil. Paint will not answer and tar does not give as good satisfaction as either of the above mixtures. The external portion of the silo may be covered with paint. The object of treating the base and inside of staves is the prescribed manner is to make them as impermeable as possible to moisture, thus reducing greatly the tendency of the stave to swell and shrink. This type of silo must be protected against wind storms unless erected in the near proximity of a barn to which it can be fastened. Heavy guy wires should be used, at least four in number, and these should be firmly anchored some distance from the base of the silo. The silo is now ready to be filled.

While filling the silo be sure to thoroughly tramp the silage, especially around the edges, as the friction of the walls causes the silage to settle less readily at these particular points. The silage should be cut in segments of one-half inch lengths. When cut in this manner no difficulty will be found in thoroughly packing same. When the corn has dried out to any considerable degree water should be added. This water may be run into the blower or added to the silage within the silo provided that the water pressure is great enough. In all cases, however, water should be added to the silage at the rate of one gallon per square foot of surface after the silo has been completely filled. The object of adding this water is to induce a more rapid decay of the top layer of silage, thus protecting to better advantage the remainder of the feed.

Upon opening the silo this decayed layer is removed. It usually has a thickness of from eight to ten inches. The silage underneath should be in perfect shape. However, we find that the quality of the silage is better the deeper we go. After about half the silage has been fed it often happens that cracks will begin to form, due to the fact that the staves show a marked tendency to shrink. When these cracks first appear the owner should tighten the hoops and keep them tight; otherwise, the staves will warp out of shape. Should this occur, it is impossible to again get the staves back in place, with the result that the air will have ready passage between the staves when the silo is filled the following year, and this means spoiled silage. After the first year less shrinkage will be noticeable.

I have discussed the stave type of silo first since we find from five to seven structures constructed of this material to every one of all other types. Some of the reasons for this are that a stave silo can be purchased all ready to set up. Then, too, the stave silo can readily be moved. When properly cared for, the average life

N. B.—This Offer is Good Only Until July 1, 1913. Club Raisers should keep 10 per cent commission to cover expense of sending in order.

of this type of structure is about ten years.

The next in importance within our state is the cement type of silo. In regard to these structures will state that silage will keep fully as well in the cement as in the stave type of silo. To be sure, the cement wall must be treated in such a manner that the walls are absolutely impervious to air. Then, too, a sufficient amount of reinforcement must be included in the walls to strengthen them sufficiently so that they will readily withstand the pressure to which they are subjected by the silage. The popularity of silos constructed of cement has been greatly augmented by the fact that structures of this order are apparently unaffected by severe drought or winds. In filling silos of this order the same precautions must be used as were suggested in case of the stave silo.

FOR MAKING SILO FORMS.

Bill of material of forms for a six-inch solid wall reinforced silo 16 feet in diameter:

16 pcs. 2x12, 6' 1" long.
4 pcs. 2x10, 2' long.
2 pcs. 2x 8, 2' 4" long.
12 pcs. 2x 6, 2' long.
2 pcs. 2x 6, 2' 6" long.
16 pcs. 2x 4, 2' 4" long.
2 pcs. 2x 4, 2' 10" long.
2 pcs. 3x 4, 3' 6" long.
2 pcs. 16 gauge galvanized iron 8'x27' 9".
12 lugs 5/8'x2"—10" long.
6 continuous threaded bolts 10" long.
96 3/8"x1½" bolts.
10 lbs. 8d nails.

Using the above mentioned form it is possible to erect 32 inches of silo wall per day.

FOR A REINFORCED CONCRETE SILO.

Bill of material for a six-inch solid wall reinforced concrete silo 16x36, capacity 155 tons, exclusive of roof.

Portland cement, (1-2-4 mixture), 60 bbls.
Crushed rock (3/8" to 1½"), 37 cu. yards.
Sand, 19 cu. yards.
Wire—No. 9 preferably, 300 lbs.
3 foot width woven wire fencing, 40 rods.
2 inch flathead screws, 2 gross.
Flooring for doors, 100 bd. feet.
Cypress for plate (1x6), 60 bd. feet.
3/8-inch bolts 10 inches long, 10.
7/8-inch round iron 36 inches long, 28 pieces.

For temporary use: 20 pcs. 18' 2x4's; 20 pcs. 14' 2x4's; 8 pcs. 16' 2x4's; 16 pcs. 12' 2x4's; 8 pcs. 12' 2x6's; 18 pcs. 7' 2x8's; 3 pcs. 16' 2x8's; 6 pcs. 16' 2x8's; 6 pcs. 16' 1x6's; 20 pcs. 12' 1x6's.

10'x10' platform for mixing concrete where power mixer is not used.

Labor: 4 men 15 days.

FOR A NEW FORM OF REINFORCED CONCRETE.

Bill of material for a cement silo 16x30, holding 120 tons, exclusive of roof.

Cement, Portland, 47 bbls.
Sand, including foundation, 16 cu. yards.
Hydrated lime, 7 sacks.
Gravel and grit, 2 cu. yards.
Hair, 5 bushel.
Metal lath, 24 gauge, 186 sq. yards.
One-half inch gas pipe 24 feet long, 2 pieces.
Five-eighths inch iron rods 30 inches long, 12 pieces.
2-inch flathead screws, 2 gross.
Sixteen penny nails, 6 pounds.
Eight penny nails, 6 pounds.
Six penny nails, 2 pounds.
Four penny nails, 1 pound.
No twelve double pointed tacks, 1½ pounds.
Cypress flooring (length immaterial), 160 feet.
Three-eighth inch bolts 10 inches long, 10.
Lumber 1x5 (or 6), cypress, 120 lin. feet.
Lumber 1x6, 60 lin. feet.
Lumber 2x16 (must be full size), 60 lin. feet.
Lumber 1x10 (any length), 60 lin. feet.

For temporary use: Lumber 2x4-16, 8 pcs.; 2x4-14, 16 pcs.; 1x6-18 (or 16), 16 pcs. (need not be new); 1x6-12, 6 pcs.; 2x6-12, 24 pcs. (need not be new); 2x8-8, 24 pcs. (need not be new); 3/8"x6", 120 lin. feet (need not be new).

Labor: First two days, 2 good carpenters, 3 common laborers; until finished, 2 good plasterers, 4 common laborers.

Corn grown for the silo should be one of the native varieties, rather than a large Southern variety, as native corn tends to develop a larger percentage of ears and consequently makes a better grade of silage. The proper time of cutting the corn is when practically all the ears show indentations on all the kernels. Should the corn crop show signs of drying up, however, due to peculiar weather conditions, the forage should be placed in the silo when the lower leaves begin to dry up. In filling, the corn should reach the cutter in as green and succulent a state as possible. This means, the corn must be hauled from the field immediately after cutting. Preferably, a corn binder should be used in this work, as the corn when tied in bundles of a convenient size, tends to facilitate the work.

Whenever possible it is to be recommended that three or four farmers get together and purchase an ensilage cutter. This greatly decreases the initial outlay and has proved a most satisfactory plan to follow.

The actual cost of filling the silo when all labor used in the work was considered, varied from forty to seventy-six cents per ton, with an average cost of fifty-six cents.

In conclusion, I am giving the comparative values of silage as determined by Prof. A. F. Haecker.

One ton of silage equals one ton sugar beets.

Three tons of silage equals one ton clover hay.

Two and one-fourth tons of silage equals one ton marsh hay.

Three and one-half tons of silage equals one ton alfalfa hay.

One-half ton of silage equals one ton pumpkins.

Following is an estimate of the cost of putting up silage and hay and the number of cubic feet occupied by each:

One ton of silage, cost to put up 56c.

One ton of hay, cost to put up, $1.50.

One ton of hay occupies 500 cubic feet.

One ton of silage occupies 50 cubic feet.

PURE BRED SIRE INSTITUTES.

To the American Breeder:—By the use of pure bred sires both the beef and dairy herds of Kansas can be improved more successfully and more rapidly than in any other way. This has been demonstrated repeatedly by communities and individual breeders that have gained reputations for good cattle. As more and more attention is being directed toward the beef and dairy industries, the use of high grade animals to head the herds cannot be too strongly emphasized. How such animals should be selected, obtained and used is one of great importance, and these questions are therefore presented by E. C. Johnson, superintendent, as the subject for the April meetings of all farmers' institutes of Kansas. Here are some of the questions: 1. What points should be considered in selecting a good bull of the beef type? 2. What points should be considered in selecting a good bull of the dairy type? 3. Where can animals of the right type be secured? 4. How long should one bull be used in the same herd? 5. How shall we co-operate in securing and using better sires in this community? 6. Why not extend the usefulness of good sires by community breeding and by exchange of animals?—Charles Dillon, Riley County, Kansas.

ANOTHER MAN FEEDS SILAGE TO HORSES.

To the American Breeder:—In answer to an article on page 20, April 5th issue, "Feeding Silage to Horses," I have fed silage the past winter to all my horses except my stallion, and have had excellent results. I feed a No. 2 tub full each day to each grown horse, divided night and morning. By this method I have reduced my grain one-half and have fatter, healthier horses. Silage cannot be beaten for all farm stock.—R. A. Wright, Woodson County, Kansas.

Questions and Answers.

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

BOWEL TROUBLE—Will you kindly tell me what to do for bowel trouble in newly born colts? Also a good preventative?—Illinois Subscriber.

REPLY—We are at a loss to know just what kind of bowel trouble you refer to but presume you desire information on impaction. This trouble usually comes from the first milk of the mother failing to establish a free movement, and the safest way to overcome the trouble is by resorting to rectal injections of clean water at the temperature of the body. A teaspoonfull of table salt may be added to each pint of water used. The injection may be made with an ordinary fountain syringe and should be repeated every one or two hours until results are obtained.

BREEDING CAPSULES—Are breeding capsules that are two years old still good?—Arizona Subscriber.

REPLY—We would advise baking these capsules. Put a few of them in a pan and put them in the oven; let them bake just a few minutes. Do not put in many the first time, as you are liable to spoil them. Experiment with your heat until you know how to properly bake them. This will do away with any possible infection.

INJURED EYE—Last July I had a young mare to get hit in the eye. The eye turned white and for a time it looked as though it would result in total blindness, but finally cleared up of its own accord, only leaving a white spot just below the sight. Do you suppose anything can be had to cause the removal of the white spot? Do you know anything about the Visio eye remedies put up by the Visio Remedy Company of Chicago? Would they be practical in a case of this kind?—Kansas Subscriber.

REPLY—It is not likely that anything you would apply at this time would have any effect in clearing the eye. It is very likely that what remains at present is the nature of a scar from the injury, and it will be inclined naturally to shrink and improve as the animal grows older.

A CHOICE OF SIRES—Will you please advise me what to breed to. I have a good Percheron stallion and I have ten of his fillies from two to four years old. Would you breed to an old Percheron stallion? Does it injure the fillies to breed to a jack? I have heard some say that it does, and have heard also if I would breed to an old stallion the colts would have old looking heads.—Subscriber.

REPLY—There is no objection to breeding fillies to aged stallions; neither will it injure the fillies to breed to a jack. If you will take good care of the progeny the heads will not look very old.

SCAR ON SIDE—I have a saddle mare coming six this spring with scars on side that I would like to get rid of, if possible. When she was four past on July 1, I think, she was running loose in pasture alone; she was running past a pond when her feet slipped from under her and she slid down the bank 20 feet or more; she slid over a stump and tore a piece of skin off of her left side back of shoulder blade, just in front of where saddle girt comes. I took this torn hide and flesh all off and took the very best care of the wound; it did not seem to get very sore; healed nicely and doesn't show scar very bad. Is a little sunken on account of the flesh cut away. There is a place about five inches long and one inch wide; there is no hair on it. What I want to know is there anything I can do to grow hair on this place? Can this place be blistered with some drug and help?—Missouri Subscriber.

REPLY—We cannot offer you any suggestions excepting to have your animal examined by a skilled surgeon with a view of having the scar removed and have the skin brought together so as to cover the place. It is possible to do this if the skin at that point is sufficiently loose to admit of stretching so the two edges may be brought together.

PINK EYE—I have some yearling and two year old calves which have sore eyes. They will swell up and have a watery discharge at first, and after a few days will begin to show a white skum over the sight. Sometimes it covers the whole ball. Two of the steers' left eyes broke and a dark spongy substance would stick out nearly a half inch. After a few days they died, and another one the right eye has broken in the same way, but it is in good flesh and apparently all right yet. Is this the "pink eye" and what is the remedy for it? I have blown gun powder in some of their eyes, and a few it apparently helped, while others it did not.—South Dakota Subscriber.

REPLY—The symptoms you describe resemble very much those of pink eye in cattle. Procure a small insect gun or bellows and puff calomel into the affected eyes twice a day.

HEAVES—Would horses from Illinois or Wisconsin that are subject to the heaves be cured by being brought to Western South Dakota and turned out on grass?—South Dakota Subscriber.

REPLY—Cases of moderate heaves nearly all improve and many seemingly recover when taken into the Dakotas. This fact has been noted by dealers who have made a practice of buying up this class of stock and have shipped to these two states, where such animals often sell in a short time as sound.

WHANG FOR MASTURBATION—Will you please give me full information as to how to make and use the leather whang and whether it should be kept on the year around or just during the breeding season. My experience in horse breeding is limited, and as I have a valuable horse that has begun to masturbate; would be very grateful for what information you can give me.—Texas Subscriber.

REPLY—The penis should be measured when not erect. The harness maker can smooth the edges of the whang leather band and stitch it together in such a way that it will be very smooth. If your stallion is masturbating it may be necessary to keep it on the year around except when you are teasing and breeding mares.

INFECTED FOOT—I have a very fine young jack; was two years old last August. I bought him last November and he got his left hind foot cut in the wire just a few days before I bought him and I have not been able to heal it yet, and there is some bumps breaking out between his pastern and hock joint just above sole. He seems to be in good health; eats well and looks well, only for this one thing. Is his blood out of order or is a jack just hard to heal? His foot is cut on the inside between the hoof and pastern; there seems to be a ridge or proud flesh, but it stays scabed over all the time. What can I do for him?—Oklahoma Subscriber.

REPLY—The wound has become infected and may yet be the cause of making you considerable trouble. You should take this jack to a veterinarian and have the wound put in order so it will heal up. This case needs an occasional injection of bacterin to prevent the formation of the abscesses complained of.

TOP CROSS PERCHERONS—I have a two year old filly; she will make a 1700 pound animal; from the mother's side, grade animals; sire's side, two crosses of pure bred Percherons. How many crosses to Percherons until my filly colts will be eligible to register, if ever? How must I go about it? I was at a public sale yesterday and bought a ten months old male colt. His mother was also there and she looked good to me, but I did not buy her. I afterwards asked the owner

about her breeding and he told me that her mother had been a registered mare but died a year ago. Can this mare be registered?—Oklahoma Subscriber.

REPLY—If the sire and dam are both registered, the progeny can be registered, otherwise they cannot be registered.

CLAMP TAIL—I have a very fine three year old horse. He seems to have the clamp tail. Can you give me any remedy for getting him to carry a high tail?—Tennessee Subscriber.

REPLY—The erector muscles of this animal's tail are weak compared with the depressors and the latter need to be divided so as to weaken them and thus permit the tail to be carried at the proper attitude. You should consult with some veterinarian who has had experience in setting up tail, for an operation is needed.

REGISTERING PERCHERONS—Can a mare out of registered stock be registered at the age of 14 years? The mother is dead.—Oklahoma Subscriber.

REPLY—If the sire and dam are both registered, the colts can be registered regardless of whether the mother is dead or alive. Write to Wayne Dinsmore, Secy. of the Percheron Society of America, Chicago, Ill., for full information.

CARE OF STALLION—Some tell me a horse must be fed bran mash, potatoes, eggs, flour, sugar and given flour in drinking water, and cooked rye, etc. If all this is necessary it looks to me as if a man would get nothing done but feeding. One man tells me that a stallion during breeding season is bilious all the time and he thinks all the above things, and more too, are necessary to keep the horses' bowels in good shape. I am not arguing against any of this "dope" but would like to know if such is the notion of up-to-date breeders?—Indiana Subscriber.

REPLY—One can hear of as varied advice in the care of a stallion as they could were the same animal ailing with some disease and medical treatment was the point under discussion. One should draw largely on his own good horse sense in this as well as in other matters. Good, clean, sound oats should constitute the chief grain ration supplemented with oil meal, alfalfa hay, grass, wheat middlings, bran, roots in moderation to give variety. A horse, like a person, enjoys a little change in diet but the things suggested should never constitute a full meal. They are, as suggested, only to be used in moderation along with the chief ration. The aim is to promote the highest possible degree of physical health. Hay ration may consist preferably of bright prairie or timothy. The matter of grooming, exercise, proper stabling and ventilation should be carefully considered as well as his diet, together with regard to systematic service. The best drink for a stallion is pure water.

BEST MORGANS AND JACKS—Could you tell me where the best Morgan stallions could be found, also mammoth jacks?—Missouri Subscriber.

REPLY—All of the best Morgan horses and jacks are advertised in the American Breeder.

MANGE IN DOGS—Will you kindly give me a cure for mange in dogs?—Missouri Subscriber.

REPLY—There are different varieties of mange in the dog, one of which (red mange) is very difficult, if not impossible, to cure. The ordinary mange will generally yield to one or two applications of a paste made up of lard and sulphur. To this one-fourth kerosene may be added, which will increase its effectiveness. First, thoroughly wash the dog in warm water and soap to dissolve the scabs and when dry thoroughly rub in the preparation suggested. Permit the application to remain on 24 or 48 hours when it may be removed with warm water and soap. Repeat in about a week if it seems necessary. This or no other treatment will cure a bad case of red mange.

BREEDING DAYS—Which is the best day to breed a mare after foaling the 7th, 9th or 21st? And when is best day to return a mare the 18th, 21st or 27th? After a mare is bred

(Continued on page 12.)

HORSE BREEDING WITH CAPSULES

Can I have any success by scooping up the semen in the vagina and inserting the capsule on into the uterus?

REPLY—When a mare is served and the uterus is so constructed that the semen does not go on into the uterus from the natural service, we are of the opinion that you would have a difficult time inserting a capsule into such a cervix after both sides of the capsule was wet with semen. Such a capsule is very slippery and will dissolve very quickly. This is more especially true where there is no cap on the capsule.

What results are breeders having by scooping up the semen in a capsule, from the vagina of a mare after she has been bred, and inserting it into other mares?

REPLY—When a capsule is wet on both sides it dissolves very quickly and unless you are very alert it will dissolve before you can get the right end of the capsule started into the other mare, which means failure.

Some partial successes were made along this line several years ago. This is an old method, but we do not know of any successful breeders using that method now. The quickest way of determining the value of this method is to try it. It is not very expensive to make a trial. This is the best plan by which any method can be valued. A box of capsules is all that one needs to make this trial. If there is a single breeder in America who has made any great success with this method of breeding the writer will go across the continent to watch him perform the operation. In the first place, when a producing mare is served by a good serving stallion the semen usually goes into the womb. In that case we do not understand how the operator would get the semen. Any intelligent man knows that in order to breed mares without the natural service, semen is the first necessity. There are some who are slow in advocating better methods, even after a new plan has been found absolutely successful in the hands of thousands of successful horse breeders.

I do not believe there is anything in disease germs. I have bred mares with the impregnator by picking the semen up off of the ground and putting it in the womb of another mare and successfully fertilizing them. Anyway I am not prepared to boil the water and use so much soap. If you can tell me how to use the capsule without so many preliminaries I will gladly try it. Give us a plain, short method.

REPLY—It is true that mares have been successfully bred by sucking the semen into a syringe when it was on the ground and injecting it into the uterus of another mare, but this is a mighty poor practice. While one mare might get in foal with an operation performed this way, hundreds of them would fail; that per cent of foals is entirely too small. Some results can be had with the capsule system by sucking the extractor full of warm water at about 100 degrees; also having a bowl full of warm water. When the service is made empty the bowl of warm water and catch the fluid in case any should be spilled. If none is spilled squirt the water out of the extractor and get the semen; then unscrew the long point from the extractor and insert the extractor into the vagina of the mare. This will keep the semen at exactly the right temperature after it is in the mare. It can be taken out of the mare while each capsule is being filled. This is very simple, but we would advise breeders to be more clean with their work.

Is it necessary to insert a capsule in the mare that the semen has been taken from?

REPLY—It is advisable to make a practice of capsuling back the same mare. She should be the first one capsuled. While it is not likely that all of the semen would be taken from this mare, yet there are times when the semen will be taken from the vagina or caught in the bowl when it is spilled. In that case the mare would not get with foal. It also serves to satisfy the owner of the mare.

Is it advisable to charge a part or all of the service fee in advance while introducing the capsule system?

REPLY—Do not introduce too many new things at one time. One of the strongest talking points for the capsule system is that the colts stand up better and stronger than they do with the natural service, because the stallion is not being bred to excess. Some capsule breeders are insuring the colts to stand and suck for 30 days. This gives the mare owners confidence in capsule colts and is a great business getter.

GAVE IT A GOOD TEST.

To the American Breeder: I have used the capsule system of breeding for the last two seasons in a limited way, but have had fairly good success. We were not fully equipped with the right kind of a place to handle our mares and use the system, but we succeeded in getting some mares in foal that had been bred for years in the natural way without results. I had one mare of my own that I had bred for four years with the natural service and could not get her in foal. In 1911 I bred her with the capsule and settled her the first time. She had one of the finest colts in 1912 that I ever raised. There were a few other mares that people had given up and would only pay if we would guarantee a colt, and we succeeded in getting them. There isn't the slightest doubt in my mind that if the capsule system is handled right it is a great success. I have gone out of the horse business now or I should use it altogether. — G. W. Tanner, Uinta County, Wyo.

BEST MONTH TO BREED MARES.

The London (England) Live Stock Journal quotes as follows from an address by the editor of this paper, delivered before the Kansas Horse Breeders' Association:

"About 85 per cent of the colts that die before weaning time are foaled before May 1st, said Mr. F. B. Graham in a lecture recently. June is the best month in which to breed mares. Colts come after the mares have usually had a little grass, which has eliminated a lot of poison from the system, and the sun had an opportunity to destroy much infection in the pastures that might cause 'navel ill.' The mare being in good condition, the colt grows rapidly, without being stunted, and usually makes just as good a horse as one of its early neighbors. Colts should never be stunted at any time if they are to make the best growth. Colts produced for show or other purposes may be produced earlier when special care is given. In June mares have passed through the shedding process; they have become accustomed to their general work and are in their regular working form. The mucous membranes are clear and very little catarrhal condition is present.

THE "COURSE IN FEEDING" WILL COME.

To the American Breeder: I just believe I can't get along without your paper. I think the course of instructions you have just commenced will be a great help to the majority of stallion owners. And, too, I think a course in feeding would be very beneficial, for too many stallioners keep their horses in show flesh, which is detrimental to breeding. An overfat stallion, we found from experience, is not nearly as sure and the colts are, as a rule, weak and small. The time to feed and the horse to feed is the mare after the colt is foaled. Then crowd the colt until maturity. There is no reason why we can't raise just as good horses, and just as big horses, as they do in France. But how many home bred horses, even though they may be pure bred, weigh a ton at 3 or 4 years old—or we might say ever? Why not? True, we have grand good sires and dams scattered all over the country, but we put too much feed on the sire and dam and not enough in the colt after it is weaned.—Will G. Collins, White County, Ind.

AN OKLAHOMAN SHOWS HOW TO START.

To the American Breeder: I am just starting to raise Percherons. Three years and three months ago I bought a registered Percheron mare; gave $500 for her. Some of my neighbors thought I was crazy. Up to date I have sold $450 worth of colts and still have two. Her first colt after I bought her was a mare and I still have her; she weighs 1800 pounds; is 3 years old this spring and will bring a colt in May. The next colt was also a mare, which I sold for $300 at 1 year old. The next one was a horse colt and a ridgling and I sold him for $150. The old mare now has a fine mare colt by her side. The mare and her colts have won $35 worth of premiums, so you see I still have $15 invested in registered horses; have three head and expect another one soon. — F. H. Gass, Alfalfa County, Oklahoma.

SERVICE RECORD BOOKS.

We are receiving many pleasing letters concerning the new form of service record books. The fact that it is small, yet has room for such a large number of mares, has met with much approval. A few have asked for the old kind which had the note form in it. We only had a few of that kind left over and these are exhausted. Those who wish the note will find it more profitable to have a regular note signed. Blank notes may be had at any bank for this purpose. A note is not what many men think it is. An open account is usually just as good as a note, except when the note is signed it is evidence that the mare owner has agreed to certain conditions, but when the note is accepted it relieves the mare owner from any lien that may be in effect in that state.

The proper thing to do is not to make this debt a common debt, but in case of a suit bring it on the grounds of a labor debt or a mechanical lien, depending on the kind of laws found in the different states. A common note is not always easily collected. An individual may own a considerable property, yet be exempt under certain conditions. Different states have different laws which should be consulted in each individual case.

HANDY TRICK WITH CAPSULE.

To the American Breeder:—After the capsule is filled about full of semen, if the cap fits tight, and you cannot keep it on (the air being compressed pushes it off), I just take a pin and make a small hole in the little end of cap, which lets the air out and works fine.—H. B. Smith, Douglas County, Missouri.

AFTER 40 YEARS' EXPERIENCE THE AMERICAN BREEDER INDISPENSABLE.

To the American Breeder:—I cannot get along without the American Breeder. I am now commencing my 40th year with stallions and jacks and do not know near all of the points, and do not expect to. I believe I have used artificial breeding longer and with better success than any breeder in Kansas, having commenced using artificial methods in 1876, and with reasonably good success all the time. Could not get along without the improved methods.—T. H. Terry, Saline County, Kas.

THE AMERICAN BREEDER

With which is combined
THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and Modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE, Editors.

Published semi-monthly (on the 5th and 20th of each month) by the
GRAHAM PUBLISHING COMPANY, INCORPORATED,
225 WEST TWELFTH STREET, Kansas City, Mo.
BELL TELEPHONE, 4297 GRAND.

Chicago Representative.
JOHN D. ROSS, 712 Hartford Bldg.

All communications for this paper should be addressed to the American Breeder, or the Graham Publishing Company, and not to individuals.

Advertising Rates.

1 inch: 1 month, $5.00; 1 time, $2.80.
½ inch: 1 month, $2.80; 1 time, $2.00.
Rates for longer time or larger space furnished on application.

Subscription Price.

One Year, $1.00; Three Years, $2.00.
In Clubs of Four, Per Year, $3.00.

When sending subscriptions, please state whether they are renewals or new ones. Always renew under the same name and initials as previously used, and at least two weeks before your present subscription expires, so that you will not miss any number. When changing your postoffice address, state the old address as well as the new one.

If you miss your paper please notify us at once and all lost copies will be replaced.

Entered as second class matter November 28, 1911, at the postoffice at Kansas City, Mo., under the Act of March 3, 1879.

Copyright, 1913, by the Graham Publishing Co.
All persons are warned not to reprint any part of this paper without first securing written permission from the American Breeder, Kansas City, Mo.

EXCHANGING STALLIONS.

A small dealer who has recently engaged in the business of selling stallions has complained about our method of exchanging stallions. After this individual has been engaged in the business a few years he will see the necessity of making the stallion business profitable. When a business is profitable plenty of money is available for investment in that line.

If a stallion can be purchased and used four years in one community, then exchanged for another stallion that may be used four years and perhaps changed again before it is necessary to make any large additional investment, the stallion business will be very profitable. On the other hand, if a high priced stallion is purchased at a tender age and kept at one stand for a period of years, then sacrificed in order to get another one, who loses the money? These good, tried, mature sires should be used to the best possible advantage, for there are not enough to go around.

Nearly every advertisement in the American Breeder offering a stallion to exchange on account of his fillies, has been a success. But the great difficulty is to get breeders to think about this. Any breeder would be glad to give several times $2.80 (which is the price of an inch advertisement) to change a stallion after he has been used as long as possible in one community, for another horse of equal value. The time to get ready for this exchange is right now. An advertisement in the American Breeder of a stallion to exchange, surely will be read by breeders at this time of year. The correspondence can be started soon with a view of exchanging stallions immediately after the season closes. Every advertisement of this kind should say "Exchange Wanted on Account of Fillies." This is the drawing card. As many as 60 words can be put in an inch advertisement and this will describe a horse fully. The advertising rate is always published on our editorial page—$2.80 for one time; $5 for two issues, or a month. Do not wait for somebody else to advertise because hundreds of other men will be answering advertisements. It is worth $2.80 to have the first choice of this large number of trades. Some man in the next county may have just the horse you want. Get your advertisement in the next issue. Every breeder that has a stallion to exchange will look for it.

ANSWERING QUESTIONS.

It is with considerable satisfaction that we mention our Question and Answer Department. No other publication in the world answers as many questions pertaining to live stock each issue, as does the American Breeder. This is a distinction to be very proud of. While some of the questions are not very important, the majority of them are. In fact, many of these questions are sent to the American Breeder because satisfaction cannot be obtained elsewhere. Our readers perhaps do not know how difficult it is to answer some of these problems—how much expense and labor it takes.

Yet we do not want any of our readers to feel that they are under special obligations to us for answering these questions. It is a regular part of the service we offer to every subscriber, and we solicit these questions, so they can be answered through the American Breeder for the benefit of all. At the head of this department in standing type we have announced that we would not answer any inquiry by letter. We cannot allow a few to monopolize the time that should be distributed equally to all of our readers. If we answered, personally, by letter, all the inquiries that some to this office requesting an immediate reply it would require the services of several stenographers and a great deal of time that cannot be given in that direction. We find it necessary frequently to make this announcement, as many new subscribers are being added to our lists who are not familiar with our method of answering questions.

Live stock breeders who are not familiar with technical diagnosing terms can learn much from this department, as conditions are described by breeders in their own language, after which the diagnosis is made from the description given. We earnestly request our readers to send in their questions and study this department carefully. No breeder knows how soon he may have just such a case as has been described.

HORSE BREEDING.

The stimulant in horse breeding is the desire to make as much money as possible and at the same time be of as much service to the community as can be. There is perhaps no other field of labor that offers the same revenue for a reasonable investment that horse breeding does today. With the hight prices and scarcity of good individuals it behooves every breeder to learn more about his business.

Since the new method of horse breeding with capsules has been found successful beyond a doubt, we cannot understand why all intelligent breeders that own good sires do not get ready for this money making plan. We all know that the limit of a stallion is easily reached with the natural service. All the mares that can be bred with capsules are clear profit. This does not interfere with making all the natural services that a stallion can stand. Why should breeders hesitate after all the statements that have been printed concerning the success of this work? The cost is very small. One colt will pay for all the instruments necessary. Nearly every owner of a stallion or jack finds many times when this could be used on Saturdays, rainy days and numerous other times.

This plan is very easily introduced. The breeder should start now and breed a few clean, healthy mares so that it is demonstrated beyond a doubt that colts can actually be produced without being served; the next year it would be moderately easy. Every breeder should build this business in such a way that he can advertise a special hour and not be confined to the breeding barn from early in the morning until late at night. Those who wish to start on a little larger basis can advertise by the postal card system, three services a week, Mondays, Wednesdays and Saturdays, at four o'clock, for capsule breeding only, on these days. The other three days could be called natural service days, making two services a day. Nine services a week is all a mature stallion should make under any conditions.

After the first year when a few colts are produced, and the mare owners have confidence in the system, those who wish to, can, if it seems necessary, cut the price and insure the colt to stand and suck for 30 days, for capsule colts only.

The time will soon be at hand when the best stallions will get the bulk of the business if properly handled.

HELP YOUR FRIENDS.

Nearly every one of our subscribers has one or more friends whom he would like to see better posted in horse breeding. If these individuals were called up over the telephone and told that they could get the March 5th and April 5th issues, and still continue in the horse breeding school by sending in their subscriptions, no doubt they would be glad to avail themselves of this opportunity. We say "opportunity" because it is really an opportunity. A lot of valuable information for any one interested in horse breeding is available in these papers; information that might mean money any day, and that cannot be found anywhere else. We believe that an act of this kind would be appreciated by those who were informed of the opportunity.

WHAT IT COSTS TO RAISE A HORSE.

If every mare owner could realize the cost of raising a horse to maturity it would stimulate him to use only the best sires and fully develop the progeny. This is a "hobby" of the American Breeder—to encourage the production of better animals, believing that profit is derived only from such mating and that the use of scrub stock is expensive. As proof of this argument we present a report from the United States Department of Agriculture, which is as follows:

"Reports have been received from about ten thousand correspondents of the Bureau of Statistics of the Department of Agriculture upon the cost of raising colts on farms to the age of three years. The average for the United States is found to be $104.06; or, if we deduct the value of work done by the horse before he has passed his third year, namely $7.52, the net cost is $96.54; this is 70.9 per cent of the selling value of such horses, $136.17.

"The cost varies widely by states, from an average of $69.50 for New Mexico, $71.59 for Wyoming, and $82.47 for Texas, to $156.60 for Rhode Island, $149.98 for Connecticut and $141.80 for Massachusetts.

Itemized, the cost is made up as follows: Service fee, $12.95; value of time lost by mare in foaling, $10.06; breaking to halter, $2.22; veterinary service, $2.04; care and shelter, first year $4.98, second year $5.36, third year $6.35; cost of grain fed, first year $4.98, second year $7.14, third year $9.56; hay, first year $4.14, second year $6.61, third year $8.48; pasture, first year $2.56, second year $5.41, third year $6.21; other costs, $5.01; total, $104.06.

"The total cost for all feed is $56.30, being $21.68 for grain, $19.23 for hay, $14.18 for pasture, and $1.21 for other feeds. The total cost of care and shelter is $16.69. Of the total cost, 54 per sent is charged to feeds, 16 per cent to care and shelter, and 30 per cent to other items, as enumerated above.

"As more than half the cost of raising a three-year-old horse on the farm is chargeable to feeds, it is readily observed how important is the influence of variation in prices of feedstuffs upon such cost."

PARTLY PERSONAL

"Great Reservoir Breaks," said the top headline in a daily paper. Apparently (judging from what followed) it was a great reservoir of black-face type.

"Gov. Hodges has set aside a date for 'clean-up' day in Kansas," said a daily paper. Supposing he had forgotten where he put it.

The Kansas Farmer did a very unorthodox thing the other day; it printed one of Albert Reid's drawings showing a Holstein calf sucking its dam.

Hilmer H. Laude of the agronomy department of the Kansas Agricultural College, and son of Geo. Laude, a Shorthorn cattle breeder, has resigned to become farm demonstration agent of Marion county, Missouri. His salary is to be $2,000 a year.

A "back to the farm" movement has been started among the Jews. Here's a backset for the agriculturists who are trying to discourage the practice of skinning the soil.

Stewart Wall, who fought a battle almost single-handed against Apache Indians in 1864 and killed 30 braves before he fell with 14 wounds in his body, died recently at San Bernardino, Cal.

Floyd B. Nichols, a live young Kansan, only two years out of Agricultural College, and one of the editors of the Fruit Grower and Farmer, has written an interesting book entitled "Making Money on Farm Crops."

In twenty years the cost of producing beef has risen 300 per cent, according to Hon. Ed. C. Lasater, former president of the Texas Cattle Raisers' Association. In making this estimate the immense proportion of beef produced on the range 20 years ago is taken into consideration.

A portrait in oil of the late ex-Governor Glick of Kansas was presented to the Agricultural College of that state recently, by the Kansas Improved Stock Breeders' Association. Governor Glick had been one of the association's presidents.

"Here's an item," observed Rivers, who was looking over the exchanges, "to the effect that the king of Sweden raises prize dogs on his farm." "I suppose he uses them," suggested Brooks, "to drive his Stockholm."—Idaho Agricultural News Letter.

The county farm adviser idea has taken Missouri by storm, according to D. H. Doane, professor of farm management at the College of Agriculture. Over 40 counties in the state have opened negotiations to secure farm advisers, or already have them.

For a good, all round "utility" little organization let us recommend to you the Anti-Horse Thief Association. There are few things this body cannot accomplish with neatness and dispatch, from shucking a sick neighbor's corn to running down a desperado. Just lately, down in Cherokee county, Kas., the A. H. T. A. has cooperated to burn all the chinch bug infected weed and grass patches.

Esta Beaman, the Oklahoma girl who won the Kansas City Star's prize of $200 for growing the best acre of corn in Oklahoma, in competition with 500 boys, has received orders for all the seed corn she grew on her prize acre at $2 a bushel. Miss Beaman produced 95 bushels and 10 pounds of corn an rocky, stumpy upland, doing all the work herself. The money will be used by Miss Beaman for a course at the state agricultural college.

JACKS AND JENNETS.

Over 4,000,000 mules in the United States, or more than half of the mules in the world, have been produced by American jacks, yet only a few men have ever stopped to study this hibrid cross, and from a financial standpoint it would have been very profitable to us if the American Breeder had never given the subject a thought. We have made hundreds of enemies by advocating what we believed to be right.

The editor of this paper conducted a jack and jennet registry for over four years without charging anything for his time, going to considerable expense to make it complete and reliable. He then donated the complete records to the jack breeders of America. No one connected with this paper now owns any stock in the Standard Jack and Jennet Registry of America, neither do any of us ever expect to make any money out of it. This is just a case where we believe we are doing right and expect to fight it out along those lines. If we were conducting a policy paper for immediate returns we could have advocated the long-legged black jack, without regard to constitution, but we believe it is better for the jack breeders to build on a solid foundation. Since we have advocated that jacks should have a reasonable amount of body and bone, breeders have begun to study and many of those who were opposed to us at the beginning, have decided that we were right. There is one thing sure, that the real value of a jack can be measured only by the mule market standards. Expert mule buyers are not looking for tall, spindling mules; neither are they placing a premium on any special color, although the steel gray mule, everything else being equal, brings the most money.

Jack breeders have learned much about the registry situation during late years. The Standard Jack and Jennet Registry of America has made a wonderful growth during the last few months. A new volume of the stud book is in preparation, and will be for sale in the near future. Every owner of good jacks and jennets should get this volume and see that his stock is registered with this association. It should be done soon. A plan is being considered now for making changes in the rules. The point will soon be reached where it is not necessary to take in any more "foundation stock"—recording animals by measurement alone. Those who have good jacks should have them registered, and should frame the certificates and have them hanging up where they can be seen. They should also see that all the good jennets in that section are registered. It is not necessary now that the sire and dam be registered in order to register jacks or jennets, but it may be soon. It is not necessary that any blood lines be given. The object is to register as foundation stock all those large enough and well enough made to fill certain measurements.

Application blanks may be had from Wm. E. Morton, 920 Scarritt Bldg., Kansas City, Mo. The rules of entry follow:

1. Pedigree must give name, color, sex, year foaled in, and name and address of owner.
2. Jacks must measure 58 inches or more from the highest central part of the withers to the ground and measure 62 inches or more around the heart girth in average condition, and have 7 inches or more measurement around the front leg at the smallest place between the ankle and knee (the leg to be normal size).
3. Jennets must measure 56 inches or more from the highest central part of the withers to the ground, and measure 60 inches or more around the heart girth in average condition, and have 6¾ inches or more measurement around the front leg at the smallest place between the ankle and knee (the leg to be normal size).
4. Any color admitted, provided they comply with Rules 2 and 3.
5. Young undeveloped jacks and jennets may be registered when their sire and dam are registered in this Registry, provided the sire fills the above measurements. This will make a uniform type.
6. Each application must give exact measurements of foundation stock, so the certificate cannot be handed out with another animal.
7. Each application must be sworn to before a Notary Public or Justice of the Peace.
8. You can give the sire and dam names (barn names) for foundation stock.
9. Tnis Registry will not recognize any other Jack Registry unless the animal meets the requirements of this Registry.
10. The fee for registering Jacks and jennets in the Standard Jack and Jennet Registry of America shall be **One Dollar to Stockholders and Two Dollars to Non-Stockholders for Each Animal Registered. The fee for transfers shall be Fifty Cents to Stockholders and One Dollar to Non-Stockholders for each animal transferred. The fee in all cases to accompany the application. Each transfer shall be recorded before the offspring can be registered.**

Stallion Service Record Book for Two Hundred Mares—The latest and best on the market, as cheap as the cheapest. It is a handy pocket size, with 224 pages of strong bond paper and a waterproof cover. It has a calendar, a gestation table and an index of twenty pages so that each mare can be found easily. Each mare has an entire page. This book can be used for several sires without carrying more than one at a time. Notice how easily it is to record the breeding of a mare and give the details. This record book is the result of the opinions of many breeders. It has no worthless advertisements in it. If you are not satisfied with it, return it and get your money, which will be cheerfully and promptly refunded to you. Price 50c each, postage prepaid. Published by

THE AMERICAN BREEDER
225 WEST 12TH STREET
KANSAS CITY -:- MISSOURI

HOW DOES THIS STRIKE OTHERS?

To the American Breeder:—If you do not mind a suggestion from your readers, I think it would be an improvement if you would make a volume of each year's papers, with the pages numbered from one, in the first paper of the year, up as high as there are pages in the year's publications, and an index for the year in the back of the last number, so your subscribers could bind them. I am saving my papers, as I have no doubt most of your subscribers are doing, but I find them hard to refer to and hard to index. The American Breeder is too good a paper to throw away after a casual reading.—W. T. McLaughlin, Calhoun County, Iowa.

LESSON OF THE STUNTED GELDINGS.

To the American Breeder: On the cover of March 20th issue I see photo of a stunted gelding. Every word is true and it will apply to jack stock, also. I have seen a great deal of jack stock in Missouri that half starved, bred only for height. Had this stock been well fed they would have been 100 pounds larger and had more quality. Long legs signify nothing. Anything that has quality and good feeding powers is well proportioned. Hog, steer or horse never feed so well if at all out of proportion. It will hold good with the mule and in order to get a good feeder he must be from good feeding parents. The Poitou jack of France is a good example. Nothing pays better than a good feeding mule well fed.—Wyatt Carr, Story County, Iowa.

IS CAPSULE BREEDING PROFITABLE?

We are receiving many letters from new subscribers asking whether the capsule breeding is profitable or not. Some of these letters ask for the experience of breeders who have tried it; others want to know whether the colts are just as good from capsules as natural service. Others want to know what results breeders have had in fertilizing shy breeding mares. For the benefit of these new subscribers we believe a discussion on this subject will be of much benefit to them. Here are some recently received letters which answer many questions, but we will be glad to print others on the subject:

"The capsule system is profitable; would not breed mares without it. The highest price colt sold from my jack was a capsule colt and sold for $130. Another one brought $125, and was one of three got with one service. Also got a mare in foal last year that was bred for a year without success; I also bred her twice natural service without success.—R. A. Fitzgerald, Bucyrus, Kas."

"I find it more profitable to use the capsule system than the natural way, and I have got mares settled with the capsule that I could not settle with the horse.—T. H. Morgan, Hendley, Neb."

"I bred more mares last year with capsules than any other way, and had the best results I have ever had and the colts are as fine as can be.—D. H. Carpenter, Pittsburg, Texas."

"I think capsule breeding is absolutely all right. I have certain hours to breed and breed every mare that is fit to breed every day; don't book anything but ten day mares. Breed as high as 20 mares a day with two jacks. If there are any 'doubtful Thomases,' if they will come here I will take them around and show them lots of mules from sucklings to two years old that the owners will swear the jacks never smelled of their mares. I have a fine jennet that had a fine jack colt yesterday that was got with one capsule and have three or four more jennets that will have capsule colts this spring. Had a jennet have twin colts last fall got with a capsule, but they died; they came too soon. Some think the capsule colts will be weak, but that is just an 'old granny' notion. There couldn't possibly be any difference so my advice is to every breeder to learn to use the capsules for they are here to stay and the quicker you learn the better.—T. E. Collins & Sons, Belleville, Kas."

ANTI-HORSE THIEF ASSOCIATION.

To the American Breeder:—I noticed a letter in your paper from a New Mexico reader inquiring about an Anti-Horse Thief Association. If he will write W. W. Graves of St. Paul. Kas., he can get the necessary forms and blanks for organizing, so that they can become a part of the largest order of the sort in America: or I would be glad to give him any advice I could.—B. H. Tollmer, Jasper, Jasper County, Mo.

SOLD REAL ESTATE AND STOCK.

To the American Breeder:—Please discontinue my ad and send me the bill so I can send you check. With the aid of your valuable paper I have sold the Chillicothe property, also the live stock advertised. I consider the American Breeder the best paper published for stockmen.—D. B. Kirby, Jackson County, Mo.

ANOTHER SATISFIED CUSTOMER.

To the American Breeder:—I put ad in your paper for two insertions and received 30 letters of inquiry and sold my jack for a satisfactory price to a man at Woodbine, Iowa. I think your paper can't be beaten: good for both farmer and breeder. A man can't afford to be without it.—J. T. Richardson, Nodaway County, Mo.

There is no satisfactory medical treatment for blackleg, but blackleg vaccine is a very good preventive. It may be obtained in many forms from different sources. The veterinary division, experiment station, university farm, St. Paul Minn., keeps constantly on hand a supply of government vaccine for free distribution to cattle owners and veterinarians.

HORSE MARKET STRONG EVERYWHERE

Improved Shipping Conditions to the South Liven Up Things Here. Meat Markets Fluctuating, But Keep Above Fair Price Level. Sheep Higher.

A general improvement was noted in the past ten days in demand for horses and mules. The few days preceding that time demand was very uncertain owing to railroad traffic east of the Mississippi river, caused by floods and heavy rains. The revival has come with the return of normal conditions and trade requirements are large again. Some dealers quoted prices up as much as $10 a head, compared with the low point two weeks ago, but to compare normal with abnormal conditions is hardly fair. The principal factor is that requirements are large, farmers who have any surplus horses are in an easy position financially, and there is no tendency to liquidate. The fact is that a horse or mule in the past eighteen months has been worth about as much in the fall as in the spring, and the general stability in prices makes equine raisers feel secure in demanding their own prices. Horses are as high in one section of the country as another. Last week in Chicago some well fattened and seasoned drafters from Glenwood, Iowa, sold at strong prices. There were twenty-eight head in the bunch that made an average price of $293.85. Most of them went to Maine. In the bunch were pairs that brought $770, $635, $630, $550, single head, up to $312.50, and as low as $215. Other markets would have duplicated the prices had similar quality been offered. In the extreme west, Miles City, Montana, on the same day, range bred, heavy colts, two and three years old from draft sires, broke only to the halter, sold at $150 to $165 a head. Heavy drafters well broken, sold on the same day up to $375 for single head and $625 in pairs. The fact that horses are as high in one section of the country as the other is the sustaining influence in the market. Farm requirements for both horses and mules is large. Improved weather has increased the demand, and some sections that formerly got their horses from local sources are buying at central markets. Farm mares are very scarce. Common, pluggy horses seem in fair demand, but requirements along that line are uncertain at all time. A good many heavy mules have been sent into the levee districts of the South; cotton mules are also in demand. Requirements for construction are about normal for this season of the year. Dealers see no reason why the trade should not continue good up to hot weather. Receipts have not been heavy, and compared with the January movement are much smaller. This indicates that feed barns have about cleaned up their supplies. A light demand is reported for saddle and driving horses, but the trade in work classes overshadows the trade in pleasure horses.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs. up.	$235@300
Drafters, fair to good	160@240
Chunks, fair to choice	135@175
Chunks, fair to good	90@130
Expressers and light draft	60@120
Plain workers	50@ 90
Southerns, good	130@150
Southerns, plain to fair	70@125
Plugs	15@ 45
Mules—	
13 to 14 hands	$ 85@135
14 to 15½ hands	125@165
15½ to 16 hands	160@200
16 to 16½ hands	190@285

Fluctuating Steer Prices.

In the past two weeks no important net change occurred in steer prices. The principal movement was confined to fluctuations, and after a considerable advance late last week the market this week eased off again. Receipts of fat steers in the past three days have been fairly plentiful though not large enough to cause prices to take to lower levels. Killers seem satisfied in keeping initial cost below $9 and with only a few exceptions none sold above $9. The top price in Chicago in the past two weeks was $9.20, and $9 is a possibility for strictly prime beeves at all the markets. The top price in Kansas City was $8.85 and in St. Louis $8.90. While the bulk of the cattle that are coming are of good quality and good flesh comparatively few show prime finish. Colorado, Kansas, the Panhandle and Oklahoma, are the principal contributors to river markets, and Iowa, Illinois and Missouri to the Chicago market. Most of the cattle marketed east are of the short fed type, and had been put in feed lots during the big movement of feeders in January, February and early March. The Colorado fed cattle are coming in excellent flesh, owing to a mild winter and many Western steers are going to shambles that ordinarily would be turned back to feed lots. The spread in prices between common and prime class is only about $2 a hundred pounds—rather unusual for this season of the year. General scarcity of cattle is the cause of such a condition. The marketing of winter fed cattle will continue for the next six weeks. By the first of June steers fed cotton seed cake on grass will be an important factor in the supply, and all cattle, except strictly dry lot kinds will begin to show grass sap strongly. The early summer market has always shown a downward tendency, but many live stock men believe that this year will prove an exception. The big movement of grass fat cattle will not begin until after the middle of July.

Quotations from the various grades of killing steers are as follows:

Prime corn fat steers	$8.50@8.85
Good to choice steers	8.00@8.45
Fair to good steers	7.50@8.00
Common to fair steers	6.50@7.45
Meal fed, choice	7.40@8.00
Meal fed, common to fair	6.50@7.35

Heifer Demand Features Trade.

With warmer weather demand for light cuts of beef have shown steady improvement, and tidy weight heifers, yearling steers, and steers and heifers mixed are selling freely at 25 to 35 cents higher prices than two weeks ago. Native heifers have sold up to $8.60, steers and heifers mixed up to $8.65, and something strictly prime, buyers say, would not miss $8.75. Shippers will buy light weight butcher cattle where they will not look at heavy steers. Tuesday two car loads of yearling steers and heifers mixed from Pawhuska, Okla., sold at $8.35. They averaged 650 pounds. This is the highest price ever paid for light weight cattle from below the quarantine line. Cows are selling up to $7.75, but as grass sap begins to show this class is expected to decline. Veal calves fell back 50 cents two weeks ago, but in the past week 25 cents of the loss was regained. Bulls are selling at firm prices.

The following quotations are for the various grades of butcher stuff:

Cows—	
Choice	$7.25@7.75
Fair to good	5.75@7.20
Common to fair	4.75@5.70
Canners	4.00@4.50
Heifers—	
Choice fed	8.00@8.50
Good to choice	7.50@8.00
Plain to fair	6.50@7.45
Common	5.50@6.45
Veal calves	4.75@9.50
Bulls	4.50@7.50

New High Record Stocker Prices.

Tuesday some 777-pound stock steers, 80 head from Kansas sold at $8.50 a hundred pounds. This is the first time such weight cattle ever brought that price on the open market and only in a few instances have higher prices been paid at stock shows. The plainer stockers and feeders, however, are some lower, and the general spread in prices is the midst of the season. Receipts continue small and the supply has been cared for closely. Cattle are moving into Kansas and Oklahoma pastures and one bunch of early Texas grass fat steers sold last week at $6.50. But it will be some time before Oklahoma or Kansas grassers are available. Feeding steers are quoted up to $8.50, and the right kind are very scarce. Stock calves were never scarcer than at the present time, and choice grades would sell at $8 or better. All classes of breeding cattle are in active demand.

The following quotations are for stock and feeding cattle:

Selected feeders	$8.00@8.40
Good to choice feeders	7.50@8.00
Plain to fair feeders	7.00@7.45
Good to choice stockers	7.50@8.00
Selected stockers	8.00@8.50
Plain to fair stockers	6.75@7.45
Stock calves	6.50@8.00
Stock cows	4.75@6.35
Stock heifers	5.00@6.75
Milch cows	35.00@90.00

Fluctuating Hog Prices.

Hog prices have remained close to the 9 cent level in the past two weeks. When shippers were out of the market packers lowered prices sharply, but when they were in the competition packers were eager for supplies. Tuesday and Wednesday prices broke 25 to 30 cents, but in the preceding days they had been on the up grade, so that the loss resulted in only in slight net declines for the two weeks. Prices at the 9 cent level sustain practically the same action as the market showed a few months ago when they hung around the 8 cent level, and then finally shot upward. Whether April or May will uncover the 10 cent level is doubtful, as packers are opposed to further advances. However, light receipts may force them to raise bids. Receipts this week have been liberal, but many farmers have shipped to be rid of the trouble when rush of farm work begins. On that account the next few weeks will uncover light receipts. The government report shows that more than 6½ million hogs died last year. Already this year the five Western markets have received 1 million fewer hogs than in the same period, 1912, and further decreases will show later in the year. Comparatively few light weight hogs are coming, and the supply is principally of the heavier classes, indicating that the marketing of the winter feeding is on the last lap. Notwithstanding the large number of heavy hogs coming packers' stocks of meats show a big decrease compared with a year ago.

The following table shows the range in hog prices in the last two weeks of March:

		Preceding Week.
Mon., Apr. 7	$8.75@9.05	$8.80@9.05
Tuesday	8.80@9.10	8.95@9.25
Wednesday	8.85@9.10	8.80@9.05
Thursday	8.85@9.15	8.75@9.07½
Friday	8.90@9.20	8.70@9.05
Saturday	8.90@9.20	8.75@9.05

The following quotations are for hogs on April 16:

Choice, 250@300 lbs	$8.60@8.75
Choice, 200@245 lbs	8.65@8.90
Medium weight	8.70@8.95
Light weight	8.75@8.95
Light weight	8.75@8.95
Common to fair	8.50@8.60
Stags	7.25@8.85
Boars	5.00@8.50
Bulk of sales	8.70@8.90

Sheep Up 25 to 35 Cents.

Sheep which for some time past have been selling relatively lower than lambs were advanced 25 to 35

CHAMPION MOLASSES FEED IS WINNER

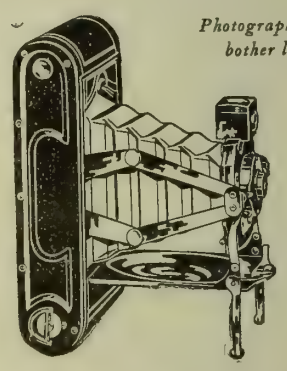
Champion Molasses fed cattle carried off all prizes at the late Fort Worth Stock Show, over cottonseed meal fed cattle. This tells the same old story.

The highest priced cattle sold during 1912 were also fed on CHAMPION MOLASSES FEED.

Write us for information and FREE BOOK on feeds.

CHAMPION FEED COMPANY, **TARKIO, MO.**

KEROSENE, GASOLINE AND OIL
To Consumers at Wholesale Prices



NO WATER IN MY KEROSENE OR GASOLINE.

XXX 46 gravity water white kerosene.....$6.00 for 52 gal. bbl.
XX 42 gravity kerosene (the kind usually sold).....$5.25 for 52 gal. bbl.
XXX 64 gravity gasoline. .....$10.00 for 52 gal. bbl.
1 case graphite axle grease (2 doz. 3 pound pails).....$3.50
40 gravity prime white stove distillate .....$4.50 for 52 gal. bbl.
83 gravity stove distillate .....$4.25 for 52 gal. bbl.
60 gallon (26 gauge) galvanized steel tank with pump and hood cover complete—a great convenience in every home.$3.60
Extra heavy pure crude oil, steamed and settled (black oil) good lubricant, just the thing for greasing tools.....$4.00 for 52 gal. bbl.

I will pay $1.25 each for my crude oil barrels, and $1.50 each for refined oil barrels, returned to me at Coffeyville, Kas., in good order, less freight charges on same.

MEAD CYCLE CO. Dept. K284, CHICAGO

cents in the past two weeks. Lambs on the other hand were quoted up 25 cents, but failed to hold the advance, and fell back to about where they were two weeks ago. Some clipped sheep and lambs are coming and that class will increase, while on the other hand wooled grades will show a decrease. Some early Texas grass fat sheep have been marketed at $6.25 to $6.50, and by the middle of May that movement will become quite general. Sheepmen say they expect little variation in prices in the next few weeks. Wooled lambs are quoted at $8 to $8.75, yearlings, $7 to $7.75; ewes, $6 to $7; wethers, $6.50 to $7.25. Clipped lambs are selling at $7 to $8; ewes, $5 to $6.25, and wethers, $5.75 to $6.50.

WINTER WHEAT FIVE POINTS ABOVE TEN YEAR AVERAGE.

The crop reporting board of the Bureau of Statistics, United States Department of Agriculture, estimates, from the reports of correspondents and agents of the bureau, that the average condition of winter wheat on April 1 was 91.6 per cent of a normal, against 80.6 on April 1, 1912; 83.3 on April 1, 1911, and 86.3, the average condition for the past ten years on April 1. There was a decline in condition from December 1, 1912, to April 1, 1913, of 1.6 points, as compared with an average decline in the past ten years of 3.6 points between these dates.

Comparisons for winter wheat states follow:

	Condition Apr.1		10 yr av.	Condition Dec.1,1912
	1913.	1912.

AN EXPERIENCE WITH SWEET CLOVER.

To the American Breeder:—I have been thinking I would write you a few lines in regard to sweet clover. Last spring I sowed 20 acres in my oats; when we cut the oats we cut the tops off the sweet clover six to eight inches; by the time we got threshed it was green and so high it covered the stubble. I got more grazing from that 20 acres than I ever got from the same number of acres. It is fine pasture for horses, especially mares and colts, also cattle. I fed it green all through the summer and fed it to my stallions and jacks; they will leave their oats and eat it. A few acres sowed near the barn would make an ideal horse pasture; it is also a great fertilizer. An authority on alfalfa says it is a superior plant to alfalfa for feeding purposes.—Wyatt Carr, Story County, Iowa.

The Rough-Road Car

By R. E. Olds, Designer

After 26 years of experience, I tell you a car for the average road ought to be built like this.

Overcapacity

The builder must know the needed strength. Then he must add at least 50 per cent, as we do in this Reo the Fifth.

He must know his steel—have it made to his formula. Then analyze it twice to make sure of it.

He can't test gears with a hammer. He must, as we do, use a crushing machine of 50 tons' capacity.

Not Enough

Tires are expensive. But oversize tires are essential to low upkeep. We use 34x4.

Roller bearings cost five times as much as common ball bearings cost. But the right car must have them. In Reo the Fifth we use 15, eleven of which are Timkens.

Drop forgings are costly, but we use 190 to avoid the risk of flaws. We use a $75 magneto, big brakes and springs, a doubly heated carburetor, a centrifugal pump. And not an engine goes out until 48 hours have been spent in five radical tests.

Reo the Fifth, without these extremes, would cost in the building $200 less. But in the next five years repairs and upkeep would cost you several times that much.

I Know

These are things I know. I have learned them from tens of thousands of cars in my 26 years of car building.

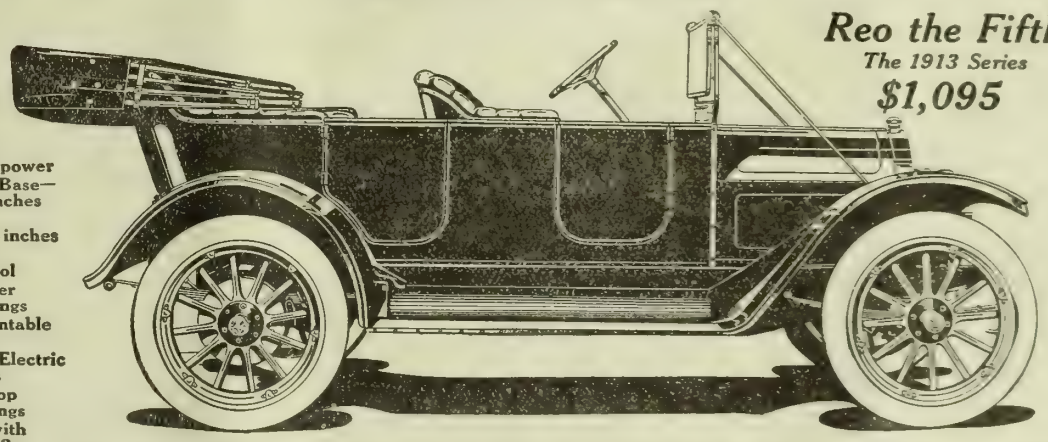
These extra precautions cost this concern two million dollars per year. We are not spending that without knowing the need of them.

We save by efficiency—by building all our own parts. We save 20 per cent by building only one model. Then we spend all those savings on hidden parts. To give you a car which, year after year, will serve you as well as when new.

Look below the frill when you buy a car. All modern cars are attractive. Find out what the maker hides.

A one-summer car is built very differently from a car that is built for keeps. If you want an honest car—a car that endures—watch these inner features.

New Control



Reo the Fifth has our new control. All the gear shifting is done with one center rod, entirely out of the way. It is done by moving this rod only three inches in each of four directions.

There are no levers to clog the way of the driver. Both brakes are operated by foot pedals. And this car, like all the leading cars, has the left side drive.

A 17-coated body, nickel trimmings, electric lights, genuine leather—all the luxury you want.

Write for our catalog and we will direct you to the nearest Reo showroom. They are everywhere.

R. M. Owen & Co., General Sales Agents for Reo Motor Car Co., Lansing, Mich.
Canadian Factory, St. Catharines, Ont.

Reo the Fifth
The 1913 Series
$1,095

30-35 Horsepower
Wheel Base—112 inches
Tires—34 x 4 inches
Center Control
15 Roller Bearings
Demountable Rims
Three Electric Lights
190 Drop Forgings
Made with 5 and 2 Passenger Bodies

Top and windshield not included in price. We equip this car with mohair top, side curtains and slip cover, windshield, gas tank for headlights, speedometer, self-starter, extra rim and brackets—all for $100 extra (list price $170).
(Gray & Davis Electric Lighting and Starting System at an extra price, if wanted.)

BIG PROFIT IN GRADE SHORTHORN STEERS.

D. L. Dawdy, a Shorthorn cattle breeder of Atchison county, Kas., recently marketed, at $97.50 per head, a string of grade steers he had bought a year earlier at an average of $30 per head. Many of them bought from neighbors, were sired by bulls he had sold them. He roughed the steers eight months and fed them four.

HIGH AVERAGES FOR SHORTHORNS.

In our last issue, reviewing the public sales of breeding stock to that date, we stated that a series of Shorthorn cattle sales was just beginning, in which the strong averages made earlier in the season, by Herefords, would in all probability be equaled. These sales (four), all held in or near Chicago, occurred the week ending April 5. The sale averages ranged from $280 to twice that sum, the 176 head of cattle sold bringing close to $71,500, or an average of over $406.

One yearling bull (Sittyton Sultan) brought $1,825, going to Winnipeg, Manitoba. Another yearling bull (Gloster Mine) brought $1,625, going to an Iowa breeder. The top for cows was $1,750, paid for Sultan's Aconite 2d by a breeder in New York. In six other cases the prices reached four figures, but prices for the most part ranged between $125 and $750. The buying territory represented extended from New York to Oklahoma and to the Canadian Northwest. Two buyers were present from Kansas City, I. R. Kirkwood and John Gosling.

WHITE'S SHORTHORNS

Good Cattle, Good Breeding, Good Dealing.

Have had a good season's business and stock is sold down to calves.

Inspection invited.

C. H. WHITE, Burlington, Kas.

CALF GROWING EXPERIMENT COMPLETE MAY 2.

To the American Breeder: Wintering of calves, what it costs and the condition of the calves under various methods of handling are questions that interest all farmers, and particularly cattle feeders. The animal husbandry department of the Kansas Agricultural College will answer these questions May 2 when a "Cattle Feeders' Day" is to be observed at Manhattan, and the feeders of Kansas are invited to attend the meeting.

On this date the animal husbandry department of the agricultural college will have completed the winter's experiment in maintaining calves. In this experiment five lots of calves were fed as follows:

Lot 1—Corn silage according to appetite; one pound cotton seed meal per head daily.

Lot 2—Kafir silage according to appetite; one pound cotton seed meal pear head daily.

Lot 3—Cane silage according to appetite; one pound cotton seed meal per head daily.

Lot 4—Corn silage and alfalfa hay both according to appetite.

Lot 5—Alfalfa hay as fed to lot 4; shelled corn equivalent to the corn in the silage fed to lot 4; corn stover according to appetite.

We expect to have an extremely interesting program, the main feature of which will be a visit to our feed lots where feeders may form their own conclusions as to the relative value of feeds for maintenance in winter. At that time a complete statement will be given as to the cost of the calves, the value of feeds, the gains secured and everything else which may lend interest and instruction to those present.

You will note from the plan of the experiment that a man will be able to see the results from the feeding of silage made from three different sources; the comparison between alfalfa hay and cotton seed meal as a source of protein; and in addition a comparison of corn silage and corn stover or a succulent versus a dry feed.—W. A. Cochel, Department of Animal Husbandry, Kansas Agricultural College.

TICKS CLEARED FROM 164,000 SQUARE MILES.

An area of 164,000 square miles in the Southern states has been cleared of the fever tick. This is nearly one-fourth of the total territory infested at the time the eradication work was begun. It is evident that the the days of the ticks are numbered and that the South will have a large part in meeting the demands for a greater meat supply.

The eradication of scabies of sheep and cattle in the West is nearing completion, and the stamping out of dourine among horses in certain sections is progressing favorably. Vaccination of cattle to prevent tuberculosis can not be recommended as safe, as such vaccination involves the use of living tubercle baccili of a mild strain, which sometimes remain in the vaccinated cattle for some years and are discharged in the milk. The work for the suppression of bovine tuberculosis by applying the tuberculin test and removing the reacting animals has resulted in producing herds which are now being maintained free from tuberculosis. The demand for hog cholera serum has been greater than the state laboratories could meet and commercial firms are preparing serum.

MODIFIED CAPSULE METHOD FOR SOWS.

To the American Breeder:—We tried the nearest approach to the capsule system of breeding mares, with our sows last November. We bred six sows per day at two services with as few "repeaters" as we had where given a full service as formerly. Each service was divided by chasing sow out from under boar when approximately one-third through. We have 50 sows for which number we formerly kept two boars. Now we have use for but one. All of the above sows were bred within a period of about 15 days.—Chas. O. Snyder, Holmes County, Ohio.

HEREFORD SALE

High Class Breeding Cattle

ONE OF THE

Year's Best Opportunities

To Get Just What You Want

in the breed that heads the list today for success in practical beef production.

65 Bulls; 45 Females;

Including a Few Polled Herefords That Are All Right.

Everything Recorded, Straight and All Right

and selected from some of the best herds of Iowa, Missouri and Kansas.

Sale At

Kansas City, May 6th, 1913

Note This List of Consignors and What They Sell:

Gudgell & Simpson, Independence, Mo., 15 Cows;
Z. T. Kinsell, Mt. Ayre, Ia., 12 Cows;
E. E. Wall & Son, Leeton, Mo., 15 Bulls, 1 Cow;
Samuel Drybread, Elk City, Kas., 15 Bulls;
John Schmitt, Tipton, Kas., 8 Bulls;
O. S. Gibbons & Son, Atlantic, Ia., 2 Bulls;
Kansas Agricultural College, Manhattan, Kas., 4 Cows with Calves at foot;
J. L. McGinnis, Moulton, Ia., 6 Bulls;
E. D. Gorman, Lineville, Ia., 3 Bulls;
R. M. Fields & Son, Lees Summit, Mo., 2 Cows, 2 Polled Bulls;
E. W. Elliott, Montezuma, Ia., 4 Cows;
Ed. Walton, Bowen, Ill., 3 Polled Bulls from Polled Sire and Dams;

A special selected lot of Herefords of the best breeding in good condition and offered at the best time of the year for buyers; females of the sort for founding herds; a number of very promising young herd bull prospects, and a grand lot of farm and range bulls. Here is opportunity for small breeder and the carlot buyers.

Sale begins promptly at 10 a. m. at the Stock Yards Sale Pavilion.

Write at once for catalog, being sure to mention the American Breeder.

WHY STOCK FOODS ARE SOMETIMES SOLD FOR FREIGHT.

To the American Breeder: The attached article on "Value of Stock Foods" is clipped from your issue of March 20. As the editor who passed this article is evidently unfamiliar with the situation, will you permit us to inform you why the manufacturers of stock powders do not, as a general rule, have refused shipments returned. In the first place, the manufacturer ships his goods in good faith on an order received from a farmer. Unfortunately, in some cases, there are men who order goods and after the shipment reaches destination, refuse to take them, with no apparent reason for such action.

Railroad companies, especially their small town agents, are negligent in sending out refusal notices to manufacturers and in the majority of cases no notice is sent until the traveling freight auditor checks the shipments on hand and causes a notice to be sent the manufacturer. Generally from four months to a year elapses before the manufacturer receives a notice, if at all, of the refusal of the shipment and during this time the railroad company, under Interstate Commerce rating, is charging 5 cents a day storage against the shipment.

To have this shipment returned, the manufacturer must pay the freight to and from destination, with storage added, at the rate of 5 cents per day. In most cases, the freight and storage amount to more than was charged the farmer in the first place, consequently the manufacturer prefers to let his shipment go to sale, rather than buy it back from the railroad company at a price greater than he has charged the farmer in the first place.—H. M. Harter, Vice-President The H. G. Harter Company.

CATTLE DIPPING REGULATIONS CHANGED.

It is ordered by the Department of Agriculture that the regulations governing the inspection, disinfection, certification, treatment, handling and method and manner of delivery and shipment of live stock be amended so as to read as follows:

Regulation 20. In states or portions thereof quarantined by the secretary of agriculture for scabbies in cattle, no cattle shall be shipped or moved interstate therefrom for purposes other than immediate slaughter, except as hereinafter provided for, unless dipped in a permitted dip under the supervision of an inspector of the Bureau of Animal Industry. Cattle originating on ranges, pastures or premises which have been cleaned of scabies under the supervision of a bureau inspector or co-operating state authorities, or which have been determined by a bureau inspector or such co-operating state authorities to be free from scabies infection by investigation made at the owner's request and at a time best calculated to ascertain the actual conditions, may on inspection and certification

LIVE STOCK PICTURES.

I make the best class of live stock photographs—suitable for making cuts or for framing. Drawings or paintings, if desired, but no cheap work. The leading live stock and farm papers of the country use my pictures. **H. L. Ritchie, Mt. Washington, Mo.**

Stannard's Processed Crude Oil
THE BEST DIP MADE

for killing lice and curing mange. One application will do more to kill lice and cure mange than three applications of any other dip made (it destroys the nits). . .....$5.00 for 52 gal. bbl.

I also carry a full line of lubricating oils.

I will pay $1.25 each for my crude oil barrels; $1.50 each for my refined oil barrels, returned to me at Coffeyville, Kas., in good order, less freight charges on same.

C. A. STANNARD, BOX A, EMPORIA, KANSAS.

"Can't-Sag" Gates Save You BIG MONEY

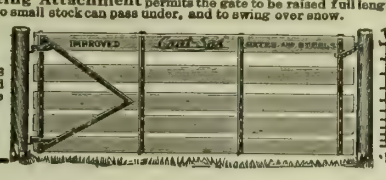
Cost only one-third as much as ordinary iron, wire or gas pipe gates, but last twice as long. Neat in appearance—best and strongest gate made—light, easy to handle, opens both ways. Boards are double *bolted* between eight angle steel uprights and double truss braces. *guaranteed never to sag.*

Cost Less Than All Wood Gates—Last 5 Times as Long

Can't Sag Gates are furnished complete, ready to hang, or just the Gate Steels which include everything except the boards. Patent self-locking hinge feature—reinforced two piece malleable hinges. Six Triangular Truss Braces make gates extra strong.

Alvin V. Rowe, Pres.

Improved Elevating Attachment permits the gate to be raised full length from 5 to 30 inches, so small stock can pass under, and to swing over snow.



30 Days Free Trial and 5 Year Guarantee

Catalog shows both complete Gates and just the Steels, at prices you can't afford to miss. Send for my new catalog with free 30 days' trial and *freight prepaid offer.*

by a bureau inspector be permitted to move interstate for any purpose. However, subsequent infection or exposure thereto of such excepted ranges, pastures, or premises by the introduction of cattle from infected or uninspected territory shall again subject them to the necessity of recleaning or investigation, as the case may be. B. T. GALLOWAY,

Acting Secretary of Agriculture.

NEW USE FOR THE EXTRACTOR.

To the American Breeder:—I have just discovered a new use for the Carlson Semen Extractor. We had a mare that could not pass her urine and as we did not have a mare catheter, we took off the soft metallic point of the extractor and bent it some near the point and had the urine started in a minute and the mare relieved. Thinking this might be of use to some one else, I send it for publication.—T. A. Penman, Champaign County,, Ill.

HOG CHOLERA ERADICATION BY NEIGHBORHOODS.

To the American Breeder: There won't be any doubt about the value of serum in fighting hog cholera if the Kansas Agricultural College is successful in an experiment to begin soon. It is proposed by the veterinarians at the college to select certain definite sections in various parts of the state in which it will be shown that cholera can be controlled and finally eradicated by the use of serum. One hundred and fifty farmers in a section about seven miles long and four miles wide, near Silver Lake, are the first to offer to co-operate in making these tests. Another section of similar size in Smith county probably will be ready for the test within a few months.

Before the college will agree to a test every hog owner in a territory must consent to co-operate and follow out the directions of the college. These directions will be mainly suggestions regarding sanitary conditions, feeding, etc. The owner must agree to have all his hogs vaccinated whether they are sick or not, and he must pay for the serum used. He must keep in close touch with the college and furnish information concerning the condition of the hogs.

The college will send a veterinary physician into the territory as often as may be necessary to vaccinate all the hogs, and suggest such care in handling as he believes will be best. The salary and railroad fare of this veterinarian will be paid by the agricultural college but the hog owners are expected to pay his other expenses. —Charles Dillon, Kansas Agricultural College.

Six million more animals were inspected in 1912 than in 1911, the greater part of the increase being hogs, of which 5,000,000 more were slaughtered in 1912 than in 1911. Of the 59,013,819 animals inspected, 203,778 entire carcasses and 463,859 parts of carcasses were condemned on account of disease or other unwholesome condition. Tuberculosis continued to be the cause of a high proportion of condemnations of cattle and hogs.

IOWA STALLION LAW.

The new Iowa Stallion Law, as amended by the last legislature and put in effect by publication, on March 20, 1913, is as follows:

Section 1. **Enrollment—annual certificate of soundness—fee.** No person, firm, company or corporation shall offer for public service, sale, exchange or transfer in this state as registered any stallion or jack over two years old unless and until he shall have caused the name, age, color and pedigree of the animal to be enrolled by the secretary of the state board of agriculture and shall have procured from him a certificate of such enrollment. The secretary of the state board of agriculture shall recognize as registered only such animals as have been recorded in some stud book recognized by the department of agriculture of the state of Iowa, and the certificate of pedigree shall accompany the application for enrollment. The state of Iowa shall be paid the sum of one dollar for each annual certificate of soundness issued by the secretary of the state board of agriculture according to the methods hereinafter provided.

Sec. 2. **Veterinarian's affidavit of soundness—annual renewal of certificate.** The owner or keeper of each and every stallion or jack over two years old kept for public service, sale, exchange or transfer shall cause said stallion or jack to be examined by a duly qualified veterinarian who shall be a graduate of a recognized college and registered as a graduate veterinarian by the Iowa board of veterinary examiners or veterinarian licensed by said board, who shall make affidavit that such animal is free from hereditary, infectious, contagious or transmissible disease or unsoundness, and shall file the same with the secretary of the state board of agriculture. Any veterinarian who knowingly or wilfully makes a false report upon the disease or freedom from disease, or soundness or unsoundness of the animal brought to him for examination shall be punished by the revocation of his veterinarian certificate. The owner and keeper of each and every stallion or jack over two years old kept for public service or for sale, exchange or transfer shall between the dates of January first (1) and April first (1) of each year after their first registration make application for the renewal of the certificate in the form and manner as above described.

Sec. 3. **Disqualification—unsoundness to be mentioned in advertising.** The presence of any one of the following named diseases shall disqualify a stallion or jack for public service and no certificate shall be issued by the secretary of the state board of agriculture: Glanders, farcy, maladie du coit, coital exanthema, urethral gleet, mange, melanosis, blindness, cataract, bone spavin, ringbone and periodic opthalmia (moon blindness).

Stallions or jacks possessing any of the following named unsoundnesses may receive a certificate but each certificate and every advertisement shall state in large type or writing that the stallion or jack is unsound and shall specify the unsoundness or unsoundnesses which said stallion or jack has; Amaurosis, laryngeal hemiplegia (roaring or whistling), pulmonary emphysema (heaves, broken wind), bog spavin, side bone, navicular disease, curb, with curby formation of hock, chorea (St. Vitus dance, crampiness, shivering, string halt).

In cases where stallions or jacks possess any of the above named unsoundnesses in a very aggravated or serious form, the department of agriculture may upon investigation disqualify such stallion or jack from public service, if they consider him so unsound as to be unfit for breeding purposes.

Sec. 4. **Certificates to be posted and contained in advertisements.** Any owner or keeper of a registered stallion or jack over two years old offered for public service or for sale, exchange or transfer who represents or holds such animal as registered shall keep a copy of the state registration and certificate of soundness upon the door or stall of the stable where such animal is usually kept, and where such animals are advertised, each and every advertisement shall contain a copy of such certificate or the substance thereof. Where certificates of registration have heretofore been issued by the state board of agriculture an additional certificate of registration shall not be required, but application for certificate of soundness shall be made offered for public service or for sale, as hereinbefore provided. Any owner or keeper of a stallion or jack over two years old other than registered exchange or transfer must secure certificate of soundness from the secretary of the state board of agriculture and advertise said stallion or jack by having and posting hand bills or posters not less than five by seven inches in size, and said bills or posters must have printed thereon, immediately preceding or above the name of the stallion the words "grade stallion" (or jack) in type not smaller than one inch in height, said bills or posters to be posted in a conspicuous manner at all places where the said stallion or jack is kept for public service, sale, exchange or transfer, together with a copy of the certificate of soundness issued by the secretary of the state board of agriculture, and where such animals are advertised each and every advertisement shall contain a copy of the said certificate or the substance thereof and the words 'grade stallion.' (or jack)

Sec. 5. **Examination upon complaint—expenses—how paid.** When complaint is made to the state board of agriculture that a stallion or jack is diseased and on investigation it is by the department deemed necessary, an examination shall be made by the state veterinarian or his duly authorized deputy the owner of such stallion or jack shall select some recognized graduate or licensed veterinarian to act with the state veterinarian and the said veterinarian shall, upon receipt of a notice, act jointly with the state veterinarian and these two shall appoint a third graduate or licensed veterinarian to act with them and their decision shall be final. In case all three or any two of the experts declare the stallion or jack is eligible to receive or retain a license, then the expense of the consultation shall be paid by the state board of agriculture out of funds collected for registration fees, or if three or any two of the experts declare the stallion or jack not to be eligible in accordance with the provisions of this act, the expense incurred shall be paid by the person owning the animal and it may be collected in the same manner as in any case of appeal in civil action.

Sec. 6. **Transfer of certificate—fee.** If the owner of any registered animal shall sell, exchange or transfer the same, he shall file certificate, accompanying the same with a fee of fifty cents, with the secretary of the state board of agriculture, who shall, upon receipt of the original state certificate, properly transferred, and the required fee, issue a new certificate to the then new owner of the animal, and all fees provided by this act shall go into the treasury of the department of agriculture.

Sec. 7. **Importing stallions or jacks from foreign countries.** Every person, firm, company or corporation importing from foreign countries any stallion or jack into the state of Iowa for use or public service, sale, exchange or transfer shall secure certificates of freedom from diseases and unsoundness from a duly qualified or licensed veterinarian in this state, certifying that said animal is free from any or all diseases and unsoundness enumerated in section three (3) of chapter one hundred (100) of the acts of the Twenty-fourth General Assembly as herein amended. Said certificate must be filed with the secretary of the state board of agriculture, who shall issue a certified copy of said certificate of soundness without charge to said importer, which shall serve as a temporary permit to offer said stallion for public service, sale, exchange or transfer until such time as original certificate of pedigree can be produced and state certificate of enrollment and soundness issued. Said temporary permit shall be invalid after ninety (90) days from date of issue.

Sec. 8. **Importing stallions or jacks from other states.** No stallion or jack shall be brought into the state of Iowa from any other state unless accompanied by a certificate of soundness issued by a duly qualified veterinarian who must be approved by the state veterinarian of the state in which the animal is purchased, such examinations to cover all diseases and unsoundnesses specified in section three (3) of chapter one hundred (100) of the acts of the Thirty-fourth General Assembly as herein amended. Said certificate must be filed with the secretary of the state board of agriculture, who shall issue a permit admitting said stallion or jack into the state.

Sec. 9. **Transporting stallions or jacks into state.** On and after July 4, 1913, no railroad company, transportation company or common carrier shall transport into the state of Iowa except for exhibition or racing purposes, any stallion or jack unless accompanied by a state veterinarian's certificate as provided in section four (4) of this act. (Sec. 8 of this pamphlet.) Violation of this provision shall be punished as provided in section eight (8) of chapter one hundred (100) of the acts of the Thirty-fourth General Assembly. (Sec. 12 of this pamphlet.)

Sec. 10. **Permanent certificate of soundness.** Any stallion or jack six years old or over and having successfully passed veterinary examinations for soundness for two consecutive years shall be entitled to a permanent state certificate of soundness. The last examination must have been made within the year in which said certificate was granted, provided, however, that said permanent certificate must be returned each year to the seeretary of the state board of agriculture with a fee of one dollar ($1.00) for renewal and must be accompanied by a certificate signed by a duly qualified or licensed veterinarian that said animal is free from contagious, infectious or communicable diseases.

Sec. 11. **Blind stallions examined upon application—expense—how paid.** The owner of any blind stallion or jack may upon application have the same examined at the expense of the owner of said animal by a board of three examiners, one to be the state veterinarian or his duly authorized deputy, one to be selected by the owner of the animal, who shall be a graduate or licensed veterinarian, and these two shall appoint a third graduate or licensed veterinarian who shall act with them, and if upon examination and proof furnished, all three or any two members of said board declare that such blindness was caused by accident or disease not transmissible, then upon affidavit of said board the secretary of the state board of agriculture shall be authorized to issue a state certificate.

Sec. 12. **Publishing false pedigrees, etc.—penalty.** Any person who shall fraudulently represent any animal, horse, cattle, sheep or swine to be registered, or any person who shall post or publish or cause to be posted or published any false pedigree or certificate of soundness, or shall use any stallion or jack over two years old for public service, or sell, exchange or transfer any stallion or jack over two years old, representing such animal to be registered, without first having such animal registered, and obtaining the certificate of soundness from the state board of agriculture, as hereinbefore provided, or who shall violate any of the provisions of this act, shall be guilty of a misdemeanor and punished by a fine of not more than one hundred dollars, or imprisoned in the county jail not exceeding thirty days or by both fine and imprisonment.

Approved March 15, 1913.

QUESTIONS AND ANSWERS.

(Continued from page 5.)

the first which is the best days for her return days and how often should they be returned to insure them to be in foal?—Oklahoma Subscriber.

REPLY—Mares can be bred from the 7th to the 9th day if properly cleaned. The 21st day after being bred is the proper return day for trial, not sooner, then every seventh day for three trials.

CHRONIC COUGH—I have a mare that is eight or nine years old that has a cough and running at the nose. I don't know just how long she has had it. I got her from a dealer in Little Rock nine months ago. He said he shipped her from Missouri and said it was shipping cold. At times she coughs a great deal and when at work she runs at the nose quite freely. She coughs up something like phlegm—like a person with a cold. I noticed the other day that she blew a handful of old yellow stuff out of her nostril. The mare is a fine animal and is in good flesh and full of life and works most of the time. I have been giving her medicine from a local veterinarian, but it does not do her any good. Please give me a remedy through your paper. —Arkansas Subscriber.

REPLY—There is evidently a catarrhal condition present which is responsible for the cough complained of. Your veterinarian should satisfy himself that the disease has not extended to the sinuses of the head to that point where it may be necessary to trephine the cavities and release the imprisoned pus. Also the possibility of glanders should be given attention and eliminated. In catarrhal conditions benefit may be had from daily inhalations of medicated steam together with appropriate internal treatment. Take these matters up again with your veterinarian. These cases are frequently obstinate and it will require patience and persistence on your part to affect a cure.

A RANK SERVER—I bought a black horse recently that when he serves he comes off proud. He is keen to get ready and mounts fine and does his work good; enters full length and apparently does a good job. He seems to discharge just a little but his erection don't cease. We waited for some time and tried him again, but with same results. This horse was not excited at any time and is so nice and gentle to handle that I cannot understand why he don't discharge.—Iowa Subscriber.

REPLY—We would advise you to investigate the record of this stallion immediately and find out the results of his breeding last year. The first thing, however, would be to test the semen. One of the first things every breeder ought to do with a new stallion is to try him, and especially a horse with a little age. This trial should be made with a microscope. It is not necessary to keep a stallion a year to find out whether he is a breeder or not now days. If a stallion is not a breeder he should not be used because it is a great loss to the community and the owner has practically lost his reputation. There may be several reasons for this stallion not being a producer. One thing should be well established in the minds of every breeder and that is that a guarantee will not always get colts. It requires live spermatozoa, which may be seen with a microscope. For the benefit of our readers in general, we wish to state that the gentleman who sent in this inquiry has been thoroughly informed on this particular subject and he gets very little sympathy here.

SWOLLEN SHEATH AND FETLOCK—My horse's belly is swollen hard, and sore from his sheath to his front legs; also one side of his sheath. I cannot find out what is the matter with him. He also has one fetlock joint that is swollen and is lame on it.—Montana Subscriber.

REPLY—Several things could give rise to the trouble complained of and among others could be an infection that involved the superficial group of lmyphatic glands that lie adjacent to the sheath. It may prove that an abscess will form at this point as a result. The fetlock may be a result of this or may be only a coincident in the way of local injury or strain. For the present we would advise that you persistently bathe these parts with very warm water and follow with a brisk alcohol rub at least three times a day. Have a good veterinarian see this animal if possible.

JENNETS TO A JACK—I have a jack that will be four years old in June; was taken off mother at six months old and has never been with its kind since; is thoroughly broken to mares. Can I put him to jennets without harming him for mares?—Illinois Subscriber.

REPLY—We would not advise breeding this jack to jennets until after the season has closed for mares, and not breed very many this year. It will be safer to wait another year, as it may have a tendency to make him slower. If you decide to use him this fall, do not allow him to tease or fondle with these jennets; just make the service and take the jennets away immediately.

LACERATION ATTENDING BIRTH—I have a young mare which foaled out in pasture last season and in so doing was seriously torn. Can she be sewed up with any satisfaction so as to continue breeding? Or would it be advisable to breed her as she is with the capsule system?—Arizona Subscriber.

REPLY—It is possible to repair lacerations of these parts, but, as a rule, rather impracticable after they have once healed. If the rent is a complete one, leaving no place where the foot of a foal could catch at the time of birth, this mare can be safely bred with capsules and very likely made a useful breeder. This method is preferable to natural service.

NAVEL CORD AT BIRTH—What is the proper way of treating the navel cord of a foal at birth? Is it advisable to tie and cut the navel cord when a person is present at foaling time? Or would there be any danger in cutting a thick navel cord without tying, as in most cases blood flows freely after the cord is cut?—A Subscriber.

REPLY—If one is present at delivery a string may be thoroughly saturated with carbolic acid or some other strong disinfectant and used in tying the navel cord, which should be about one inch from the body. If the colt has been delivered any length of time do not tie the navel cord, for if there are any germs in it there is no chance for them to escape. The tendency is for the fluid to wash the germs out. The best method is to wash the hands thoroughly and strip the navel cord downward, forcing the fluid out, then apply the drying powder which is sold by the American Breeder for 50c a can. This shrinks the cord, preventing germs from entering the body. It is also a disinfectant. One can is sufficient for a dozen colts. It is put up in a box similar to a pepper box so that it can be dusted on the cord without much waste. This is the best preventative that we know of.

ORCHITIS—I have a stallion which in shipping a distance of 1,500 miles last week developed a serious injury. His testicles are very badly swollen (as large as your head). The bag is too tight. I am at a loss to know just what to do or what the trouble is. There is no veterinarian in this vicinity. What would you recommend to be done? Is it a rupture or enlarged testicles?—Arizona Subscriber.

REPLY—We infer from your communication that your stallion is affected with orchitis or inflammation of the testicles and more than likely will be ruined for breeding purposes. A suspensory should be so arranged that it will support the weight of these inflamed glands and after carefully packing about the parts with cotton or woolen cloths, hot water should be applied for an hour at a time, three times a day. You should have a qualified veterinarian see this animal at the earliest date, even if you have to send some distance for one. We would judge you have a very bad case.

COLLECTING SERVICE FEES—I had a Shetland pony mare and bred her to a young pony stallion on condition to pay service if she brings a live colt. I sold the mare to a reliable party in Ohio and told the stallion owner that I would keep track of her and if she is in foal I would pay the insurance, even if the colt was dead, but he said the insurance is due as soon as she left my hands. One of my mares was in heat afterwards and the pony refused to serve her, as he was driven hard and only a colt three years old. Am I under obligation to pay for this service? I am not sure if mare sold came in heat afterwards, as I did not bother after he refused to serve one. Please quote Ohio law on this point. This man makes no business of standing his pony and had no bills posted.—Ohio Subscriber.

REPLY—The service fee in your case does not become due until the colt is delivered alive. If the owner of this stallion had advertised the fact that when a mare changes hands the fee then becomes due and payable at once, and you, as a mare owner, had seen this advertisement and acknowledged it, then this bill could have been collected according to law; or if it was a part of the contract that you should pay the service fee when the mare changed hands, he could have collected the money at such a transfer.

STRANGLES—Will you please tell me if there is more than one kind of

ROBISON'S PERCHERONS

Public Sale May 21, at the Farm, Towanda, Kansas

60---STALLIONS AND MARES---60

FEATURE:---25 Imported Yearling Stallions and Fillies, all blacks and greys; sired by such stallions as Champion Imprecation, Intitule, Casino Glacis, sons of Etudiant and others of note,

ALSO—15 American bred yearling Stallions and Fillies; 10 to-year-old Stallions and Mares; 10 Stallions and Mares over two years old—some imported.

Some of the mares sell with colts at side.

Bettina, Champion of American Royal 1912

and a daughter of Imprecation, are features. This is the biggest lot of Percheron yearlings ever put in an American sale and I expect buyers to get many bargains.

Stallion Notes a Specialty.
E. R. Smith, Lawyer, Fairfield, Iowa.

distemper? And what is that called that breaks out and runs? Also, how to keep the other horses from catching it? What is the best cure?—Missouri Subscriber.

REPLY—The word distemper is simply an old word signifying disease and does not properly apply to any particular disease. The disease that usually manifests itself by the formation of abscesses is generally known as strangles and is infectious in character. Treatment is governed much by the symptoms shown and in a general way consists of the use of bacterin together with such treatment as will facilitate the prompt development of the abscesses when they have once begun to form with surgical measures at the proper time.

SHORT TAILED COLT — Will you please answer through your valuable paper if there is a case on record where a mare bred to a docked horse brought a short tailed colt? I have a young English Hackney stallion which was already docked when he came into my possession at 18 months old, having a stub tail of about eight inches, and I have heard from good authority that one of his mares brought a short tailed colt just like him. The mare is quite a distance away, so have not gone to see it yet. This mare was formerly owned by me and was worked by side of the stallion, which was full of friskiness and would tease her more or less, which I think is to account for the naturally short tailed colt.—Ohio Subscriber.

RTPLY—There might be an occassional freak in any line of breeding. This might have come from a stallion that had a complete tail. We do not believe that a stallion that has had the tail docked is any more liable to get short tailed colts than one with a long tail. If a stallion is a freak and has a naturally short tail, some of his colts may be expected to be likewise.

QUESTION CONCERNING CASTRATION — I have a mare that weighs about 1350; she is a Morgan. I have been told that she is very near thoroughbred. I have a horse colt and his sire was a Denmark; he is a fine colt; will be a year old the first of May. Do you think it would pay to keep him or not? If not, when should he be castrated and at what age? Would it pay me to raise this kind of colts or take her to a grade Belgian or Percheron, or a jack, for the best sellers?—Missouri Subscriber.

REPLY—No male should be reserved for breeding unless a pure bred individual of high merit. All others should be treated with the knife and yours should be no exception to the rule. There is quite a notion with some people when they have a colt that is a little better than the ordinary, to keep him for a stallion. This idea has kept a check on the progress we should have made in horse breeding. Your mare is about 300 pounds heavier than the Morgan type, which the parties perhaps did not consider when suggesting that she was very nearly thoroughbred. As to whether or not one should breed draft horses, saddle or harness horses or mules, depends very much on how one is situated. Men are making good along all lines. The draft horse and mule generally find ready sale at the halter, while the harness horse and saddler have to be educated. If one has the inclination and facilities, handling the better class is quite remunerative, but if not, they had better raise mules and heavy horses.

WASHING THE PENIS—Should the penis of a stallion be washed after serving a mare? If so, in what? If you can refer me to any book that treats on this subject, or give a discussion through your paper, or send me a back number that perhaps is just what I need, I will appreciate it very much.—Indiana Subscriber.

REPLY—During the act of copulation the penis is greatly enlarged, but usually retracts, causing wrinkles where germs can accumulate that would not be disloged with any fluid in the way of a wash. Disinfectants strong enough to destroy these germs would be injurious to the animal. Use bran and water mixed together and insert handful after handful of this material into the sheath, and move it around so that the entire surface comes in contact with this bran mash, leaving it there and allowing it to escape later. It is not necessary to wash the penis after using the bran mash. It will all come out. This should be done about once a week with the average stallion. This will leave a smooth surface. The important thing is not to allow a stallion or jack to serve a diseased mare.

LAMINITIS—I had a mare to foal Friday evening but the colt was large and came wrong, hind part first; colt lived ten minutes; the afterbirth did not come until two days later. What is best to do to get the afterbirth away? The mare is very low; temperature is about normal but the mare seems to be awful weak and can hardly stand on her feet. The feet seem to be very hot; she acts like founder. We have to raise her up but it seems like all her limbs are hurting her. She stands up for about an hour or two but she is shaky and every foot seems to hurt her; she can hardly move at all. Is there anything to get the heat out of her feet? I put on some old rags and moistened them with cold water on all four feet; it seemed like it did her good. She is eating some hay and oats; I generally put a little hot water on the oats. The mare in 9 years old. The mare is fleshy and an easy keeper. Do you think the kidneys are affected on account of the afterbirth staying in so long?—Minnesota Subscriber.

REPLY—It would appear that your mare has laminitis as a result of the trouble attending birth, and you should continue the cold applications to her feet, using ice water preferably. The stall should be roomy and be kept well bedded so she will lie down a good part of the time and relieve the weight from the feet. You should have a good veterinarian see the mare as early as possible with a view of preventing the difficulty becoming chronic. Chronic laminitis is very difficult to cure.

BREEDING WHEN NOT IN HEAT—One of my patrons has a mare 15 years old that does not come in heat. I bred this mare at 7 and 9 years old and got a colt each year from one service each year, and since the last colt she has never been in heat. When the last colt was a yearling we tried her every week for several weeks and she always fought the horse. I let the horse cover her twice that season but with no results. Tried her every year since. This mare rides the other mares and acts like a stallion when the other mares are in season. Can this mare be treated or given any drug or feed of any kind to bring her in heat?—Ohio Subscriber.

REPLY—The heat period may be very short in this mare, lasting only a few hours. If you will try her every day for three weeks you will likely find a heat period. But this is not necessary, as you can breed her with a capsule whether she is in heat or not. Great care should be exercised not to breed a mare of this kind while pregnant. Occasionally females come in contact with male animals without it being known, which, perhaps, is not the case with this mare, as she has been tried several years.

COCKED ANKLE — I have a colt coming 1 year old and it is cock ankled. It just got that way this winter. What would you do for it?—Iowa Subscriber.

REPLY—First clip the hair from the fetlocks affected and also along up the course of the back tendons and apply the following vesicant: Powdered cantharides one ounce, biniodide of mercury 40 grains, vaseline four ounces. Mix all together and rub into the parts briskly with the hand for several minutes. Tie the animal so it cannot come in contact with the parts with its nose for 24 hours, and then wash off with warm water and soap. When dry apply a little cottonseed oil once a day to keep the parts soft. Repeat in three weeks if necessary.

RUSHING A STALLION—I have a stallion that is nice and gentle; teases a mare nicely, but when I go to breed a mare he gets ready and gets within ten to fifteen feet of mare and makes a leap for the mare. Can I get a bridle to conquer him and break him from that habit? If so, where can I get one?—Ohio Subscriber.

REPLY—You can get the "Conqueror" bridle from the Kansas City Impregnator Company of this city. This bridle has a very severe bit and is made with pullies so that the bit pulls up in his mouth, and if properly handled, will control any stallion. A stallion that has formed this habit may make the rush whether the bridle hurts him or not the first time, but his mouth will eventually get sore so that he will be easily handled. The best way is to take this stallion out and teach him to go where you want him and do the work as you want him to do. This is the most severe bridle that we know of. It is only used for bad horses and jacks; it is not intended for a fancy bridle, but is for use exclusively in these cases, and if properly handled will perform this service.

LEUCORRHOEA—Is it possible for a mare to have leucorrhoea without showing any symptoms? I have had mares brought here that had been bred elsewhere and didn't conceive and when I examined them I found their cervix was filled with a dirty, whitish discharge; some would smell badly while others would not. Some were old mares that never had colts and others were young and some had had colts. Last year I turned away twelve mares that had a thick whitish discharge, and even some of these were mares that had colts with them. I heard later that they were bred to an-

A Few Registered Percheron Mares and Fillies

For sale, sired by Germain, one of the draftiest stallions in America. Same in foal to an imported grandson of Jules.

Also a few stud colts, all priced to sell.

MANUEL CROSS,
Adrian, Noble Co., Minn.

GERMAIN 29430, (44788)

IMPORTED PERCHERONS AND BELGIANS

I have a lot of the best specimens of the two leading breeds. I have personally selected them carefully for big bone, with quality, style, action and breeding, with weight from 1800 to 2200 pounds. I give a gilt edge guarantee, good for two years, with every horse. I am going to sell them down very cheap, considering the quality. Barns are four blocks from A. T. & S. F. depot.

W. H. RICHARDS, D. V. S.

EMPORIA, KANSAS

PERCHERON AND FRENCH DRAFT stallions for sale. One Percheron, coming three years; four Percherons coming two years, and one French Draft, coming two years.

Three of these colts are grandsons of the famous Besique 19602.

J. C. Stewart, Route 6, Monmouth, Ill.

Draft and Coach Stallions

A fine bunch of Percheron, Belgian, French Draft and Coach stallions for sale; priced from $350 up. I have the big ton kind that are right. Come and see me, or write. J. M. Nolan, Paola, Miami County, Kas.

PERCHERON STALLION.

For sale. The Percheron stallion, Brilliant 87815; registered in Percheron Society of America. Good breeder; sure foal getter; good heavy bone; quiet disposition, but with good life; broke to work. **Joseph Phillips' Estate, Hay Springs, Sheridan County, Neb.**

IMPORTED AND HOME BRED STALLIONS.

I will sell imported stallions, $800 to $1,000, except two stallions. Home bred stallions, $300 to $600. Come and see my horses. Frank L. Stream, Creston, Iowa.

IMPORTERS OF PERCHERONS

and dealers in American bred draft horses and Standard bred horses and high class jacks. Will sell at right kind of prices and terms to suit purchaser. Give us a look before buying elsewhere.

Fisher & Walker, Evansville, Indiana.

REGISTERED DRAFT STALLIONS AND MARES

for sale; mostly Percherons. Also road stallions, mares and colts at prices to suit your pocketbook and full value; can furnish most anything you want. **E. P. Hamilton & Sons, Garden Grove, Decatur County, Iowa. R. F. D. No. 2.** We are 23 miles southwest of Chariton and 24 miles southeast of Osceola. (Station, Leroy).

150 STALLIONS.

Home bred draft stallions, $250 to $650. Guarantee to sell you imported stallions for less money than any firm in America. Come to a live stallion market and see all draft breeds. **A. Latimer Wilson, Creston, Iowa.**

IMPORTED AND HOME BRED STALLIONS AND MARES.

PERCHERONS, BELGIANS, SHIRES.

The best importation we ever made is now in our barns ready for inspection. The mares include some of the best fillies that came out of the Perche this year. See what we have before buying elsewhere. **Address Hart Bros., Osceola, Iowa.**

PERCHERON
AND FRENCH DRAFT

Stallions for sale. 7 head of extra good stallions, two to five years old; weight 1600 to 2260 pounds. The good kind at farmers' prices.

100 head to pick from; size, quality and breeding. We won over 50 first and second prizes and gold and silver medals at the Wisconsin State Fair. Grand Champion Belgian and Percheron stallion at head of stud. Prices and terms to suit. **Ives & Bellman, Delavan, Wis.**

other horse, but did not get with foal. Now which solution would you use on this kind, the saline or iodine? I did not give them an acid test last year but will if they come again.—Iowa Subscriber.

REPLY—Yes, it is possible for a mare to be very badly affected with diseases of this kind and never show any external symptoms. You did exactly right in discarding these mares. The general use of the saline solution is in order, but the older, more obstinate cases should have an occasional injection of the iodine preparation.

NEBRASKA STALLION LAW—I would like to know if it is still necessary to have a stallion examined in this state (Nebraska)? The examination board notified me where to have my horse examined last spring, but I have not heard from them this year. I think the law a little unjust when a man cannot exchange horses with his neighbors without having them examined.—Nebraska Subscriber.

REPLY—This law has been found unconstitutional, but we understand that an effort is being made in the present legislature to enact into the old law certain provisions that will make it constitutional so far as the claims in the last contest are concerned. We will report later. Perhaps you will get word from the stallion registration board if the legislature amends these defects.

ABORTION—I have a six year old mare that raised one colt and then carried the next one about four months and now she did the same thing again; lost the last two. Will she do the same thing again or is there anything that I can give her to make her carry the colt to full time?—Iowa Subscriber.

REPLY—Your mare is affected with abortion and you should not think of breeding her again until she is thoroughly sound. She needs proper irrigations at the hands of a qualified veterinarian until the mucous membranes are sound. It will only result in a repetition of your past experience if you breed this mare again without having her attended to. The fluid extract of black haw will aid very materially helping her carry the colt through the gestation period. It may be given in dram doses twice a day, after being bred, which amount may be increased to half an ounce as she nears the period when she aborts.

KEEPING THE SEMEN—If a man lets his horse or jack cover a mare in the morning, can't he fill his capsules and put them in the incubator at 100 degrees and use them the same day at any hour he may need them? How soon does the semen have to be used after being extracted with a Carlson semen extractor?—Kansas Subscriber.

REPLY—Too many men are looking for impossibilities. We have always discouraged the plan of keeping the semen any length of time. There will be enough failures when the operator attends strictly to business and breeds all mares present. There are, however, some wonderful records made in this direction. The semen has been carried several hundred miles and used successfully; it has been kept several hours with good results, but we would not advise our readers to do that. The proper thing to do is to have a regular advertised hour, using the capsule system otherwise only when a number of mares happen to be present.

PROPER FEED FOR STALLION—I have a Percheron stallion coming five years old this spring which has been fed on corn and hay which is about half and half millet and cow peas. There is considerable ripe seed on the millet but it is very nice, bright hay. I have been feeding him for the last two weeks on one quart wheat bran and three quarts oats, which I expect to feed the rest of the season, but should I keep on feeding the hay? He is in fine shape and health. Will it be all right to use him twice a day this season? I expect to use the capsule system as I have over 100 mares. I have never tried anything in the way of artificial breeding but will try the Carlson system this year.—Illinois Subscriber.

REPLY—You have been feeding too much corn to your stallion during the winter and millet hay that has ripened to a point where the seed is formed is not suited for a stallion as an entire ration for roughness. Let this be only a part of the ration and supply good, bright prairie or timothy for the main part. You should be able to breed 100 mares easily with the capsule system with one service a day and your horse will be the better for it.

EXERCISING A STALLION—How much exercise ought a stud horse to have before he starts services?—South Dakota Subscriber.

REPLY—The exercise should be started several weeks before the season begins and increased very gradually in order to build up the physical condition of an animal. Exertion should not be started too rapidly, just enough to keep the digestive organs in a healthy condition. Some horses require more exercise than others, but no serious changes should be made in either feed or exercise. Everything connected with the breeding business should be moderate and all changes made very gradually.

PERHAPS NAVEL ILL—One of my neighbors has a fine colt; when it was born its navel got a little sore and it has quite a large soft lump on its stifle; when it was two months old, when it walked the stifle would crack. It got over the cracking but the lump is there. Can it be taken away?—Ohio Subscriber.

REPLY—At this time it will be proper to apply something in the way of a blistering agent to the parts. First clip the hair closely from over the parts, then mix one ounce of powdered cantharides with four ounces of lard. Apply this ointment with the fingers, rubbing in briskly for several minutes. Permit to remain on for 24 hours at the end of which time carefully remove with warm water and soap. When dry apply a little sweet oil daily to keep the parts soft. The colt should be tied so it cannot molest the parts with its nose while being blistered. Repeat the application in about three weeks. This case should emphasize the need of preventative treatment at the time a colt is foaled.

BEST TIME TO BREED—When is the best time to breed a mare, when she first comes in heat or just before she goes out?—South Dakota Subscriber.

REPLY—The best results will be had by breeding a mare just as she is going out of heat, and a better per cent of foals can be had by breeding in the evening when mares can be taken home and given a rest.

HERNIA—I have a colt born this morning (April 15) which is navel ruptured. Will you kindly tell me what to do for it? It is a pure bred German Coach and I would like to make a good horse out of it.—Texas Subscriber.

REPLY—Cases of this kind should be treated by a competent veterinarian for the reason that surgical measures are nearly always needed to effect a cure.

ENLARGED NAVEL CORD—Please inform me how to treat navel cords which are more than usually large.—Minnesota Subscriber.

REPLY—Enlarged navels are frequently due to infection. A once or twice a day application of tincture of iodine usually causes a reduction in the size of the cord. This agent may be applied with a small brush or the tip of a feather. Here is another case showing the necessity of giving immediate attention to the navel cord when the colt is dropped.

CONDITION OF MARES—I have a team of large mares that I worked hard last year and they are not in very good condition. I have fed them wheat hay and a little grain and stock food all winter. They have had good care and no work. These mares are with foal. Please give me some advice how to get them in better condition.—Washington Subscriber.

REPLY—Gradually increase the feed. This should be of a slightly laxative nature, but make the change very gradually.

GETTING THE SEMEN—Can a man get the semen two hours after a mare has been bred and use it with success with the capsule or syringe?—Iowa Subscriber.

REPLY—On several occasions mares have been served and taken from 10 to 15 miles where the semen is extracted and a number of mares bred successfully. This success can only be expected, however, in cases where the semen has been deposited in the uterus in clean, healthy, normal mares.

EXPERIENCED BREEDERS WANTED—I have a fine Percheron and can get more mares than he can serve with natural service. Do you know of a good man that you could send me that understands using capsules? And please advise me what he would cost per month. The horse is a registered Percheron. Montana Subscriber.

REPLY—We do not know of a single man you can employ. We have received hundreds of letters of the same kind recently. This is a great field for men who wish to learn scientific horse breeding and one who has been successful should be able to command at least $100 a month for four months during the breeding season.

CLYDESDALE HORSES

Stallions and mares of all ages for sale.

Also Shorthorn Cattle.

W. A. DeMerritt

Route 2, Plainfield, Ill.

RECORDED SHIRE STALLION

For sale; 6 years old; weighs over a ton; well broken to work; gets 75 per cent of mares in foal. State certificate of soundness furnished. Must sell on account of his colts and have colts to show. No trade; must sell for cash or bankable note and are pricing him at a sacrifice. **B. M. Boyer & Sons, Farmington, Iowa.**

REGISTERED STALLIONS.

Four Clydesdales and one Percheron coming two years old; all big fellows with plenty of bone and quality. **John H. Chambers, Edinburg, Johnson County, Indiana.**

THREE CLYDESDALE STALLIONS

for sale, coming four and three years old. **James Spear, Stanwood, Cedar County, Iowa.**

A STUD COLT—What does colt mean? Does it mean the mare is a colt or that she has a colt at foot?—Canada Subscriber.

REPLY—Among breeders of pure bred stock a colt is usually referred to as a stud colt. A female should be called a filly. When used in connection with a mare, the term colt might describe either a stud or a filly colt.

ABORTIONS—I have used the extractor and capsules for two years and last year I bought a microscope and find it a great help. Would not think of doing business the old way. Last season I bred 200 mares, capsuled them all and had good results. I bred a number of mares that went for four and five months, trying them every week during that time and they never came in heat, still they are not in foal. There are lots of them here the same way. Kindly let me know what you think is wrong.—Canada Subscriber.

REPLY—Your mares have been slipping their colts. The owner should be instructed to watch the hairs on the tail coming in contact with the vulva to see if there are any clots of blood. This is about the only way that a mare owner would be able to diagnose this condition.

A SLOW STALLION—Would be pleased to get information what to do with my stud; he is slow to get ready and when he covers the mare he seems to come off too soon. From about 90 mares bred he gets about 40 with foal. The horse is a pure bred Percheron, 12 years old, in good condition, and weighs 1950 pounds.—North Dakota Subscriber.

REPLY—You can adopt the capsule system very successfully with this horse by diminishing the number of services. He will probably make three or four services a week very easily, and the fact that he dismounts too soon is evidence that he does not discharge a large per cent of the semen into the uterus. If you adopt the capsule system you can place the semen in the uterus, where it must be before fertilization can take place.

HARD WORKED MARES—I would be glad to see an article in the American Breeder on the breeding qualities of hard worked, poorly fed, thin in flesh mares. I have thought much on this subject. I cannot get them to produce foals.—Arkansas Subscriber.

REPLY—You are not alone in this difficulty. If you can arrange to let these mares go until the last of the breeding season you will have much better results with them, or it would even be better to breed them in the fall as they may have an opportunity to get enough to eat when turned on grass. You should have the owners

of these mares read the American Breeder.

BARREN STALLION—I have a registered Percheron that will be three years old in May. I bred him to ten mares last year and none of them are in foal. Would like to know if he will be all right this year. He has good feed and a two acre lot to run in when the weather permits.—Indiana Subscriber.

REPLY—The chances are that you will not have a very sure horse if he ever produces. We would advise you to test the semen immediately before you fool your customers. If there are no live spermatozoa try him again after he has had a few services; if none are found, then you might make a trial of this horse by turning in several shy breeding mares and let him run with them. There may be some condition present that interferes with the ejaculation from the vas deferens. Plenty of exercise along this tract might give the desired results. It would only be a chance, however. It may be that your stallion is masturbating. In that case the above treatment will be of some benefit, also.

A KEEN JACK—Two years last spring I purchased a jack, supposed to be a sure breeder, but in very poor shape to make the season. He got 40 per cent of all mares bred. Last season he got 75 per cent of all mares bred and 85 per cent on what one would call breeding mares. This jack, when turned in a lot where cattle have been, will smell where they have been and then will discharge from a few drops to about two tablespoonfuls of clear substance like water. Can it be he abuses himself? He does this without any erection of penis. Can a jack discharge without an erection of penis?—Iowa Subscriber.

REPLY—We do not believe that your jack is masturbating. He is perhaps one of those sensitive fellows that is always looking for something to smell and he has formed the habit of urinating just a little. As long as the per cent of foals like you have named above are obtained, there is not much danger of masturbation. You should be very proud of the per cent of foals this jack is getting for you.

BARREN MARE—I have a mare that is 12 years old; was bred as a three year old and had a colt. Was not bred for two years and was bred again twice and had a colt; bred nine days and again twenty-one days and had a colt; was not bred again that season; was bred the next season and the next two and she has not settled, but throws off a thick white or bluish white substance. When this mare foaled the last time her quarters were small and I think she did not have room to throw the colt clear and strained too hard. Would that have anything to do with her throwing off this white stuff? What can I do to get her in foal again. Her last colt is four years old April 27.—Kansas Subscriber.

REPLY—You will find full instructions for treating this mare in the last issue under the head of "Barren Mares." You have probably bred this mare to a stallion that had recently served a diseased mare, and you are now reaping the benefits of it.

RING BONE—I have a horse that is getting ring bone, and he is very lame.—Pennsylvania Subscriber.

REPLY—You should take your animal to a competent veterinarian and have him fired. This method of treating ring bone is the most certain to effect a cure of any yet devised, and you should lose no time with less effective remedies.

PREGNANT MARE BRED OUT OF HEAT—If a mare is bred when not in heat with the capsule system will she come in heat at her next regular time, if she gets in foal by the capsule service when she was not in heat?—Colorado Subscriber.

REPLY—If a mare is bred with a capsule between two heat periods she is liable to come in heat the next heat period and yet be with foal. When mares are bred out of heat with capsules they should not be returned for retrial for 30 days. This is one reason that mares should not be bred out of heat while the capsules are being introduced, as it is difficult to make a mare owner understand that his mare might be with foal when she shows to be in heat.

TRAVELING CAPSULE BREEDERS—In opening a mare would you insert one, two or more fingers. I weigh 145 pounds and have a medium or smallish hand. My horses are Belgian five years and Percheron nine years old, and weigh 1500 pounds each, in thin flesh. I bred 80 mares to one horse here at home last year. I recently purchased a good Belgian and wish to stand the two at four places besides here. Do you think I can do it by using the capsule system? I have used the capsule system some and think I can do it successfully. Will sixteen miles a day for four days a week be more exercise than the horses should have? Expect to go and come in the cool of the day and want to make the four stands eight miles away—Pennsylvania Subscriber.

REPLY—One finger is sufficient when the natural service is employed. If a mare should be very tight, it is not advisable to make the opening too large as it might cause some irritation. It is only necessary to make the opening large enough for the spermatozoa to be injected into the uterus at time of service. We would not advise giving a draft stallion 16 miles of exercise for four days each week. Ten or 12 miles might be admissable. If you have pike roads so that there is no mud and a smooth surface, they might make it. You should have started this exercise some time ago in order to have your horse prepared for this exertion. You might get up early in the morning and travel eight miles and then eight miles in the evening if everything is favorable. You plan of making several stands and using the capsule system should be a success if you will be careful with your work.

SHY BREEDING JENNET—I have a jennet that I have been breeding for four years and fail to get her in foal. I have tried six different jacks on her and one horse, and failed. I have lots of mares brought to me that don't breed and I have good luck, but this jennet has me thinking.—Illinois Subscriber.

REPLY—You will probably find your question answered in the April 5th issue. It would be difficult for us to tell you just what to do with this jennet from this short description. If you have another one or two like this one, or at least enough to get you thinking a little more, you might give a better description.

BELGIAN - PERCHERON CROSS—Will you kindly advise me what will be the results in breeding Percheron grade mares to imported Belgian stallions? Is it advisable?—Kansas Subscriber.

REPLY—It is usually advisable to breed in line when suitable sires are available, but there is no objection to crossing a grade draft mare to an outstanding individual of any draft breed when high priced geldings are wanted.

RANK STALLION—I have a stallion coming ten this spring. He is a very cagy horse to make the cover and most of the time comes off proud and wastes a lot of the semen, but is a very sure breeder. What would be good to feed him to make him a little slower? He is the best teaser that I ever put the bridle on. Never bites a mare but will get off a mare before he gets through. Would feeding him some saltpeter make him a little slower? Some one told me that that would take away some of his ambition.—Illinois Subscriber.

REPLY—Do not feed this stallion any drugs and do not use him for a teaser if you can help it. Cut down the number of services. Pay particular attention to the kind of a bridle you have on him; if it is severe, try something easier; he will probably make a better service. Your stallion is an exception if he is an extra sure breeder and dismounts proud.

MULTIPLE IMPREGNATION.

To the American Breeder: I notice an article in the paper in regard to twin colts, horse and mule. I have none of that kind, but we have had several twin horse colts and twin mules, but none of horse and mule. About four years ago one of our patrons, Stewart Comer, bred a western mare five times that season, the last

Lafayette Stock Farm

We Are Glad to Inform our Many Customers and Interested Buyers that We Have Without Doubt the Largest and Best Selection of

Percheron and Belgian

STALLIONS AND MARES

both imported and American bred, ever offered to the trade, in ages running from three years old on up. The Percherons, blacks and grays in color; Belgians, blacks, roans, sorrels and bays in color.

We can suit any buyer in a horse and price. We don't want the intending buyer to think because we won all the first prizes in France, except one in 1912, nor because we won most of the prizes offered at the International in 1912, that our horses are priced high. We can and will sell as low as any importer can sell them, quality considered, and with a good guarantee. We make terms to suit you.

J. CROUCH & SON, Props.

LAFAYETTE :-: :-: INDIANA

W. A. LANG & CO.

Greeley, Delaware County, Iowa

Importers of BELGIAN and PERCHERON STALLIONS AND MARES.

We wish to announce to the buying public that we will now, as in the past, give you more good, sound, young horses for the money than you can get elsewhere. We do not advertise cheap stock because we do not think the best breeders want that kind, but we will sell you the good ones at as reasonable margin of profit as possible and do a remunerative business. All horses are backed up by our GILT EDGE GUARANTEE. Write for full particulars, mentioning this paper.

STALLIONS IN SERVICE

At Maple Summit Stock Farm.

Mon Gros 5937 (64988), for two years the champion Belgian stallion of the International Live Stock Show; also the prize winning Percheron Guacke 61993 (71368). These great stallions will make the season of 1913 at the Maple Summit Stock Farm. For further information write.

M. A. McMAHAN, JERSEYVILLE, ILLINOIS

D. K. ROTH

GIBSON CITY, ILL.

IMPORTER AND BREEDER OF BELGIANS AND PERCHERONS

Not How Many, But How Good.

Square Dealing My Motto. Write Me Your Wants.

service August 5, and the following June 3 she foaled a dead mule that was rotten, and they put her to work again, and July 1 or 2 (I do not remember which) they went that morning and she had a live mule, but another mare running in the lot with her also foaled a colt which was about one month too soon. Both lived until fall and died. Another of our patrons, J. C. McCalzin, bred a young mare two years ago some three or four times and last spring she had a fine filly from our Percheron horse, King Edward 59649, and bred back to him April 19. July 27 she slipped three filly colts all fully developed up to the time. The mare was only served once.—G. W. Gatewood, Morgan County, Ind.

MORE JACK MEASUREMENTS.

To the American Breeder:—I see some descriptions given of our readers' young jacks. As I have two pretty fair ones, will give you their names, ages, measurements and weights. First, John Cullin, black with white points; 61 inches high; 68-inch girth; 20½-inch arm; 9½ below knee; 11½ below hock; ear from tip to tip, 33½; age, 20 months; weight, 850 pounds. Second, Black Hawk, black with white points; 61 inches high; 66½-inch girth; 21½-inch arm; 10 inches below knee; 11¾ below hock; 34 ear; age, 18 months; weight, 830 pounds. I think your paper fine and will do all I can for it. Yours for good stock.—J. D. Holder, Monroe County, Mo.

AD. SOLD THEM $3,300 WORTH.

To the American Breeder:—Find inclosed check to pay for advertising. We got good results from our ad. Sold the three jacks advertised at $1,100 each, and could have sold more had we had them.—Yeager & Broshears, Oakland City, Gibson county, Ind.

MISCELLANEOUS.

700 ACRES

Of good farm and pasture land; good $2,000 house; good barn; plenty of water. Two good jacks and three jennets; one good stallion and a good stand—250 mares each year. Must sell at once and go to the high plains of New Mexico for wife's health. If interested, write me at once. **W. C. Milling, Union, Newton County, Miss. R. 5.**

Attention, Farmer or Speculator!

A fine 400 acre bottom farm in Oklahoma; over half in high state of cultivation; fine for alfalfa; five room modern house; five tenant houses; near a Frisco station. All fenced and cross fenced; barn. Has cost owner over $25,000. Willing to lose over $5,000. No mortgage. Must sell. Terms given. No trades. Address **W. H. Holt, Suite 400, Insurance Bldg., Oklahoma City, Okla.**

FOR QUICK SALE

A choice 2-year-old stallion saddle colt at a bargain. Large enough for service. **R. C. Obrecht, Topeka, Kas. Route 7.**

$600 BUYS

The Rex Denmark—Black Squirrel bred saddle stallion, REX KNOX 3115. Black; 15.2; five years; sound. A great acting show horse and sire. Fearless under saddle and in harness.

Also the ladies' beautiful saddle mare, MANCELONA II. Bay; 15.1; four years; sound; eligible to registration; safety city broken to saddle and harness and suckling fine foal by Rex Knox. Destruction of my barns by fire makes this sacrifice imperative. **W. T. Wilkinson, Eureka, St. Louis County, Missouri.**

PERCHERONS

Six Home-grown 3-year-old stallions, making 1900 to 2100 pound horses; the BIG TYPE. Richest dapple and steel grays and blacks. In attractive flesh ready for heavy service. April 10 I have these 3-year-olds besides yearlings and 2's and want to sell them. **Fred Chandler, Route 7, Charlton, Iowa.**

METHOD TO IMPROVE SLOW OR TIMID JACKS.

To the American Breeder: We take a number of farm and stock journals and among them are some of the best in their line, but thus far I have found nothing so instructive and really necessary to the stock man, as the American Breeder. Each and every issue contains something new and helpful to me, and it occurred that I might offer something that possibly would assist some of the beginners in handling their slow or timid jacks.

While I endorse fully the oft repeated cautions that one should abstain from harsh treatment, boisterous conversation, and prevent as nearly as possible having men, boys, dogs, cats or other unnecessary distractions for the jack during service time, yet there is one point on which my experience has differed with that of some others, viz.: in the practice of having the jack do his own teasing.

If a jack will tease, I invariably insist on him doing his own work. Substituting the horse as a teaser is hard on his constitution, very disappointing to him and in many cases quite injurious. On the other hand, if the jack has been successful at his work of teasing, and has been rewarded by a service, he should only be the more prompt next time.

Now comes the point I wish to make—do not use the same stall or pit for teasing that you use for breeding. To illustrate: We use a room 14x18 for breeding room; next to this on one end is joined the box stall for the jack, having a slatted partition between so the jack may observe all that is being done in the breeding room. The mare to be tried is brought into the breeding room at the other end and led to the teasing stall at a corner fartherest from the jack; after the jack is brought out and the mare found to be in heat he is then returned to his box where he may watch the mare being led into the breeding pit (which is in the corner near his box) and may watch while she is being examined and prepared for service. He must not be allowed to tease at breeding pit, but if ready, encouraged to mount at once; if not ready, return him to his box and close the door. This disappointment usually has a good effect; after two or three minutes bring him out again; the second or third time he will be ready. In this way he will soon learn to get ready when he sees the mare in the pit and mount promptly when led out. A month of this treatment—always using the same routine—the jack will scarcely ever get erect at teasing pole and scarcely miss being ready at breeding pit.

Let the same party handle, feed and care for jack from the beginning to the end of the season. A Missouri mule man once said to me: "Be kind to the jack for he can think of but one thing at a time," meaning—if your jack is afraid of you, he will be watching you, when his attention should be entirely on the service, and thus your very presence would be a hindrance instead of a help.—Leonard Smith, Laramie County, Wyo.

ANOTHER MISSOURI JACK.

To the American Breeder:—Our jack, Jumbo, is black with white points; he is seven years old and 16 hands high; weighs 1,270 in breeding flesh; from tip to tip of ear 40 inches; flank 79 inches; heart 76 inches; arm 21 inches; fore leg below knee, nine inches; hind leg below hock, 10 inches, and a 22-inch horse collar is a tight fit.—Wm. Everly, Harrison County, Missouri.

FLOODED WITH INQUIRIES.

To the American Breeder:—Inclosed find check. I wish to thank you for the good done in the ad. Have been flooded with inquiries for the stuff advertised.—J. H. Bright, Bedford, Lawrence County, Indiana.

BARGAINS!

I Am Cleaning Up My Stock Of Big Jacks and Draft Stallions.

And am making the lowest prices you ever heard of for stock as good.

Just come here, pick out what you want and if you don't buy it wont be the fault of the price.

I don't believe in having any good, serviceable stock left when the season ends, and this is the way I keep from it. Come and see.

W. J. Finley, Higginsville, Mo.

A Few Jacks

And They're Good Ones

Still for sale. Big bodied, big boned, with plenty of height, good feet, heads and ears—the class that sire the highest priced mules and bring money to your community. Jennet herd headers, too.

Come and See What I Have.

J. H. SMITH,

Kingfisher, - Oklahoma

14---KENTUCKY MAMMOTH JACKS---14

From three to six years old; from 15½ to 16 hands high with nine and ten inch bone. Priced to sell quick. Write today for prices and description.

Five Percheron stallions left for sale cheap. Farm and sale barn on 21st street; one mile east of Wichita. Union Stock Yards. **J. C. Kerr, Wichita, Kas.**

CLOSING OUT SALE.

Two black jacks, three years old; 14½ hands; sired by imported Black Hawk, dam by Gladstone Jr.; $400 and $500; terms if necessary.

Also 16 hand Saddle Stallion at sacrifice to close barn for season. **Kentucky Sales Stables, Fort Smith, Ark.**

GOT A POINTER ON TIMID JACKS.

To the American Breeder:—I bred a few mares with capsules last spring and I know I will have some capsule colts. Don't know just how many, as I have not been out to see. I am the only man in this part of the country that has tried this method and I have plenty of "knockers." One man, especially, who tried the impregnator and did not get a colt, has discouraged every one he can. I am preparing for a good business this spring. I have the only big jack in this part of the country. Men will have to accept the capsule system or go elsewhere.

Will say for the benefit of men who have timid young jacks to break: I bought a big jack 30 months old last spring; he was so timid I could hardly get him close to a mare; had to lead him up behind the mare, and then if she switched her tail, he would run. I could not get him to serve; tried every way that I knew except the jennet. Had almost given up, but I saw in the American Breeder the experience of an old jack breeder, who said: "Turn the jack loose with a stud colt a few days, then select a suitable mare; lead the jack up close where he can see; lead out your stud quickly; let him serve the mare; take the stud away quickly and lead the jack up

Lake View Stock Farm

For sale, 15 jacks as good as any one has, from six months to five years old and from 14 to 16 hands high. I can sell them for less than any one. Write for particulars or come and see them. T. H. Early, Centralia, Boone County, Mo.

20 JACKS.

Coming one to seven years; the big, rugged kind. Can sell you tried jacks, show jacks or herd headers worth the money. Everything guaranteed as represented. **H. T. Hineman, Dighton, Kas.**

BLACK JACK

For sale; 13½ hands high and built like a British bulldog with lots of quality. He is coming five years old and has had only light service. Any one wanting a showy and well made jack can find him here at $350 cash, or will trade for part cash and part in good young driving mare. **F. D. Terry, Centaur, St. Louis County, Mo.**

JACKS AND STALLIONS

I can furnish a few extra good registered jacks and jennets, also a few choice draft stallions, for less money than any one. L. Donaldson, Olney, Lincoln County, Mo.

JACKS AND PERCHERONS.

25 biggest and best Mammoth jacks in Ky. Few Percheron stallions. Price cut from $100 to $300 on every one. Big stock high grade Percheron mares, Hampshire and Large Black swine. **H. T. Brown & Co., Lexington, Ky.**

JACKS AND MULES

We have 14 jacks from one to six years old; have lots of bone, size and quality; all black with white points.

Also have 128 yearling mules, coming two year old, and 26 mule colts. These mules are from grade draft mares; have lots of bone and width. Only 15 out of the 154 are horse mules, the balance are mare mules. Will sell at reasonable prices. **Scott, Abney & Jenkins, Virden, Macoupin County, Ill.**

JACKS AND JENNETS.

Forty head of Mammoth jacks and jennets for sale. Jacks in age from colts to four years old; in size up to 16 hands. These jacks are all good ones; in this lot are two as good as grows—good enough to head any herd of jennets. I have one of the best herds of jennets in Kentucky. I raise all my own stock and will sell them worth the money. Write for prices today, or better, come and see them. **U. G. Saunders, Flemingsburg, Ky.**

Headquarters for

Mo., Ky., and Tenn. Jacks

Sold singly or in carload lots. I guarantee more bone and more good Jacks and jennets than any breeder or dealer in Missouri. Every one black and from 15 to 16 hands high. Have them of all ages. Thirty-five years doing business with the public, and never had a lawsuit with a customer.

ED. BOEN, LAWSON, MO.
(Lawson is 28 miles from Kansas City.)

KENTUCKY JACK FARM
Established in 1884.

A fine lot of black Mammoth Kentucky jacks. Big bone and plenty of weight. Will sell at special prices in order to make room for young stock. We sell more jacks to the Western trade than any breeder in Kentucky. Write for prices or come and see me. Guarantee to please our customers. **Joe E. Wright, Junction City, Ky.**

FAIRVIEW JACK AND JENNET FARM

32 Jacks and 35 Jennets, the best that grow, 14½ to 16½ hands high—jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address

J. C. HUCKSTEP,
Eolia, Pike County, Mo.

GRANDVIEW JACK FARM.

EIGHT JACKS FOR SALE.

Combining the blood of Autar, Black Giant and Lime Stone Wonder; all black, white points.

Have either a trotting or a coach stallion for sale or will trade for a good Percheron mare or jennets. Must be a good one. These horses are sound and the very best of breeders, but have one too many. **Chas. Wyatt, Petersburg, Pike County, Ind.**

JACKS.

20 good black jacks and some good jennets; coming 3 to coming 8 years old. Large, heavy boned, broken to mares and prompt servers. Prices reasonable. Come and see me. Barns 2 miles from town.

Phil Walker, Moline, Elk County, Kas.

300 head of Colorado raised Jacks, Jennets, Mules and Brood Mares. All guaranteed. Prices right. **Lewis Swink & Son, Rocky Ford, Otero County, Colorado.**

gently and let him smell. Do not let him mount until he is ready, and your trouble is over." I did this and I selected a two-year-old filly that was in good heat; let the stud serve her; before the horse was through the jack was striking the earth with his front foot. I took the horse away and let the jack to her. The work was done as quickly as the horse; brought the same filly out the next morning and he served her promptly. My trouble was all over.—B. H. Jones, Baca County, Colorado.

ASKING TOO MUCH OF STALLION OWNER.

To the American Breeder:—The plan that a stallion owner is to insure the colt to stand and suck is, in my opinion, asking too much of the stallion owner. The expenses of keeping a stallion are much greater than keeping a mare. If the stallion owner makes an agreement with the mare owner to collect the service fee when the mare is known to be in foal, I think this is fair enough. The stand and suck plan may be all right in the east, but here in the west, where the mares are allowed to run out all winter, as well as summer, and the mares are apt to foal during a severe storm, makes it hard on the stallion owner to insure the colt to stand and suck.—Fred Anderson, Meagher County, Montana.

BREEDING ARMY REMOUNTS.

The United States Department of Agriculture has completed for the present the purchase of stallions for use in the encouragement of the breeding of horses for military purposes. Four Morgans, ten Standard breds, eleven American Saddle horses and nine Thoroughbreds have been purchased. These stallions, with four or five Morgans from the Morgan Horse Farm and six Thoroughbreds presented to the government, will be available for public service during the season of 1913, making a total of at least forty-four stallions. Local wishes will be respected and the breed of the stallion placed in a community will be that which is most generally preferred by that community. Accordingly, the Morgans will stand in Vermont and New Hampshire, the Thoroughbreds mainly in Virginia, the Saddle horses and Sandardbreds mainly in West Virginia, Kentucky and Tennessee. Furthermore, every effort is to be made to avoid competing with privately owned stallions, and horses will not be placed in communities which are already well supplied.

The government has not spared expense in the purchase of horses. The first requisites were that they should be good, sound individuals, and registered in the proper studbooks. Good breeding was therefore essential, and in many cases stake and show ring winners were obtained, but no horse was bought solely because he was a race winner or solely on account of his pedigree.

These horses will be available for public service on liberal terms. The owners of sound mares, with a square trotting gait, may breed such mares free of charge provided they give the government an option on the foal during the year it is 3 years of age at $150. However, the government will not hold the breeder of a foal to his option if he wishes to be released, but will allow him to cancel the option at any time by paying the service fee. This fee will be $25 for mature stallions, and less for those under 5 years of age. In buying the colts, the War Department has agreed to purchase both mares and geldings. No service fee will be charged unless the owner elects to cancel his option. If the government buys the colt no fee is charged; if the colt is offered to the government and purchase refused, no fee is charged.

On account of the provisions for free service, the government believes that the mares bred should be suitable for the purpose, and therefore it will be necessary to breed only those which are free from the following unsoundnesses: Bone spavin, ring bone, side bone, heaves, stringhalt, lameness of any kind, roaring, periodic ophthalmia, and blindness, partial or complete. Mares must also be free from manifest faults of conformation, such as curby hocks; pacing mares will not be bred. Approved mares will be given a certificate of registration in the Remount Brood Mare Register of the Agricultural Department.

EVERY MARE BRED WITH CAPSULES CONCEIVED.

To the American Breeder:—Last year was an exceptionally good year for breding on the plains. We will get about 85 per cent of colts. Every mare we bred with capsules will bring a colt. Bred one mare 18 years old that had never had a colt, but had been bred time and again, but if she lives until the first of June she will be a mother for the first time. We think, and in fact know, that the capsule system is a grand thing and a success. There are three things to be careful of, and if followed closely you cannot help having success; namely: First, keep your horse or jack in a good, thrifty condition in order to discharge strong spermatozoa; second, be clean with your instruments and yourself; third, don't let the semen get chilled. —Hester Bros., Sherman County, Texas.

A REMARKABLE STALLION.

To the American Breeder: Being a reader of your paper, I would like to tell you about the gamest and best stallion on earth. His name is Sherbet 9111; trotting bred stallion; 25 years old; had a trial record 2:13½; race record 2:16¼ at 16 years old. Never was sick a day in his life; always ready for a feed and was examined under the new stallion law and was as scund as a dollar. Bred 50 mares; had 27 living colts, last year; seven mares aborted. I stand the horse at $25 to insure; never move him. I bred 62 mares last season; as large percentage in foal as any horse that stands here; he has 34 in list; some going a ten clip. Billie Sherbet paced in 2:05; he gets speed from common road mares; has never had a high class mare. If any one has a better horse for his age, would like to hear from them.—Clyde Johnston, Livingston County, Ill.

One time a good friend of ours advertised that he had for sale the "best jack in the world." Soon he began to get letters from other men offering to prove that they had better jacks. Then along came his second letter saying: "Please change my ad to read—'Best jack in Texas County, Mo.' That takes in quite a lot of territory."—Editor.

21 HIGH CLASS STALLIONS

For sale at low prices for quality of stock. Eight saddlers, five trotters and eight Shetland ponies; royally bred and grand individuals—many of them prize winners in strong competition. For prices and full description, address **Barbee Stock Farm, Monticello, Drew County, Ark.**

MORGAN HORSES.

FOUR MORGAN STALLIONS.

For sale; registered; all blacks; 15½ hands; 1,100 pounds; matured and good ages. Will sell for $300 to $1,000 each. If looking for Morgans be sure and inspect my horses as they are of the very best type and Black Hawk breeding. **E. F. Brown, Derby, Lucas County, Iowa. Rte. 2.**

REGISTERED MORGAN HORSES.

My Morgans are large 15 to 16 hands and 1050 to 1300 pounds, are clean, bony, hard and possess all of the style and endurance for which the breed is noted.

For Sale Weanlings to 3 year olds by The Admiral 3451 A. M. R. sire by Jubilee De Jarnett. Send for catalog. **Richard Sellman, Rochelle, McCulloch County, Texas.**

A GREAT MORGAN FOR SALE, $1500

Perry Morgan, foaled April 25 1910; got by Sherman M. 5512, by Irving Morgan M. 5517; dam Baby, by Logan L. 12959. Sorrel, weighed 820 as a yearling, and will make a 1250 or 1300 pound stallion. He has won first in class three seasons in succession. I am unable to work, due to an injury, and must sell this stallion at once, or find some one to care for him. Have sold two of his half brothers to head studs in Washington and West Virginia.

L. A. FLINT, BOX 77, WABASH, IND.

PURE BRED MORGAN STALLION

For sale; registered; guaranteed sound and a sure breeder. Price $175. Write to **A. A. Koboskie, Beaver Dam, Dodge County, Wis.**

PONIES.

KANSAS CITY IMPREGNATOR CO.,
12th & Central Sts., Kansas City, Mo.

SNAP FOR STOCKMEN

$5 to $15 Per Acre.

For Missouri or Oklahoma lands, practically all in native blue stem grass, 50 per cent subject to cultivation, fine running water, two to eight miles from Kansas City Southern Ry., and only 200 miles straight run to Kansas City market.

Cattle and hogs are being raised and laid down on the K. C. market at less cost and greater profit than at any other point in the southwest. Pasturage most all year 'round. Clover, alfalfa, corn ,etc., make good crops. Ample rainfall. Most of land in native timber with fine grass.

BEST HOG COUNTRY IN THE WORLD

Stock hogs come from this section because they are free from disease and it costs practically nothing to raise them.

Fine climate. No bad blizzards or hot winds. Ideal country to enjoy life and make money. This same land put in fruit is netting annually $100 to $150 an acre. Tracts of several hundred acres or more at $5 to $15 per acre. For particulars address **Wm. Nicholson, Immigration Agent,**

KANSAS CITY SOUTHERN RAILWAY, 671 Thayer Bldg., Kansas City, Mo.

Irrigated Farm Land

With Abundant Water Supply.

Grazing Land (Watered) and Timber for sale in Southwest Colorado. Irrigation facilities here are unexcelled and this has long been Colorado's best live stock section.

Fine, moderate climate; no extremes; tornadoes unknown.

155 acres fine private water right. 2½ miles from Mancos; 30 acres in meadow, timothy and red top. Alfalfa, meadow, grain land, small orchard. Good six room house just been remodeled. Hay barn 40x56. Horse barn, cow sheds, chicken house, shop, granary, ice house, etc. Good fence; $55 per acre; a bargain.

160 acres; good house; barn, cross fences; chicken house; sheds, etc.; four shares in storage system besides fishing in waste water. Four acres in cultivation. New farm; fine land; four acres in orchard; $5,000.

160 acres four miles from town; good small house; barn; fenced; partly under cultivation; fine land; $2,000.

Raw land, agricultural and grazing at $5.00 per acre.

W. L. Morse, Mancos, Colorado.

LAND FOR STOCK OR FOR CASH.

Will sell or trade 320 acres in Crow Wing County, Minnesota. Will trade for registered stallion and mares, jack and jennets, or cattle. Address **C. N. Herbranson, Rollag, Minn.**

800 ACRE STOCK RANCH

For sale or exchange for other property in Kansas or Missouri; fine agricultural and grass land in Eastern New Mexico; 2 sets of improvements, including good windmills and wells. $10 per acre. For further particulars write **L. F. Williams, Murdock, N. M.**

"REAL ESTATE WANTED."

Sell your property quickly for cash, no matter where located; particulars free.—Real Estate Salesman Co., Desk 9 Lincoln, Neb.

WILL EXCHANGE

Good Southern farm and timber land for good brood mares and fillies, or Jersey cattle. **L. A. Byrne, Texarkana, Miller County, Ark.**

160 ACRES OF HAY LAND

for sale or trade for pure bred horses; Percherons; mares preferred. Price $20 per acre. F. D. Maddex, Arcadia, Neb.

PECAN VALLEY FARM

For sale; 162½ acres, deep, rich, black soil. You can't beat it. Come and let me show you, or send for description. Sam Avard, Hawthorn, La.

TAKING IN A LOT OF TERRITORY.

To the American Breeder:—I see some of your readers have what they think are good jack colts. I think I can show the best one in the whole world. He was foaled in good old Arkansas. He is 15 months old; 15 hands high; made good all over and has a 36-inch ear from tip to tip. Mr. Phil. Walker of Kansas, who is a big jack man, measured him and said he would have to take his hat off to this young gentleman.—R. C. Macon, Benton County, Arkansas.

ADVERTISING BRIEFS

Read the advertisement in this issue of M. A. McMahan, Jerseyville, Ill. He has his two prize winning stallions in service at his farm for the season of 1913.

Wm. Hawkins of Blue Mound, Ill., is advertising a black registered Percheron stallion for sale in this issue, priced right.

Among the importers always known for the quality of draft stallions which they bring to this country, one of the first always to be named is the firm of J. Crouch & Son, Lafayette, Ind. This firm from the quality of its exhibits at the leading live stock shows, as well as from the character of its sale stock at all times, has justified its reputation.

The Gudgell & Simpson consignment to the Hereford sale at Kansas City May 6 consists of fifteen heifers, two years old past and all bred. They are all of their own breeding and strong in Anxiety 4th blood. These heifers are sired by Beau Picture, Beau Dandy, Domino, Beau President and Bright Donald. These heifers are all safe in calf to their regular herd bulls. Some of them will drop calves within thirty days from the sale day. They have not been injured by high feeding but have had plenty of good feed for development and spent their entire lives out of doors so that there is every reason to believe they will do well and prove regular producers for the purchaser. With grass right at hand this is the most favorable time to get some of these good heifers. They will soon have calves at foot to pay the bill and at small expense for production. This is the kind of heifers that will look good in any breeder's herd and the very best foundation stock for the new beginner. Send for catalog to R. T. Thornton, 1318 East 15th St., Kansas City, Mo.

A jack sore remedy that has been advertised in the American Breeder now for over a year on a straight "money back" guarantee, and which has undoubtedly made good, is Jack Sorine, manufactured by O. P. Wilson & Co., 3754 Wayne Ave., Kansas City, Mo. Read their advertisement in this issue.

Samuel Drybread, Elk City, Kas., is consigning fifteen choice bulls to the combination sale to be held at Kansas City May 6. These are a very choice lot and run in age from 12 to 26 months. They are the heavy boned, easy feeding sort and are well marked and richly colored. These fifteen bulls have been selected out of 150 head and are strong in Anxiety bloodlines, being close descendents of such bulls as Beau Brummel, Imported Britisher and others. Send for catalog to R. T. Thornton, 1318 East 15th St., Kansas City, Mo.

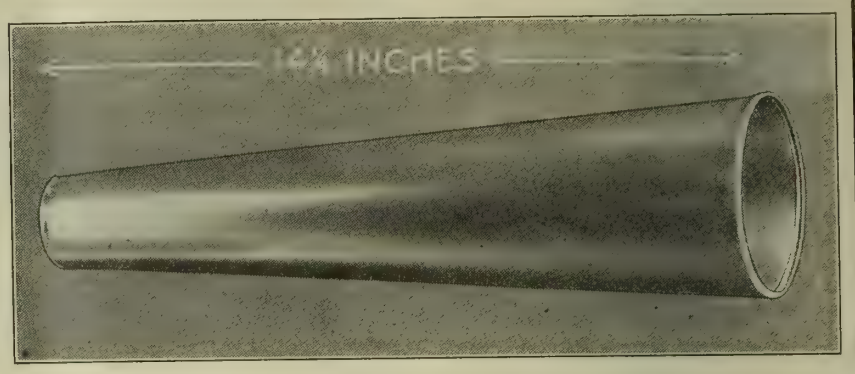
Our most consistent advertiser of high class Morgan horses is Richard Sellman of Rochelle, Tex. Mr. Sellman is one of the improvers of the breed and keeps nothing except Morgans of strictly good lineage. He writes us that he is enjoying the best trade this spring he has ever had, and has been making carefully selected additions to his herd in order to keep up with the demand. We hope every interested reader will write him for a catalog.

J. H. Smith of Kingfisher, Okla., is entitled to continued good business and a great deal of credit for the enterprise he has shown for providing high class jacks for the trade in his and adjoining states. In this connection we want our readers to notice the special advertisement of Mr. Smith in this and the succeeding issue, which shows a group of the jacks he has for sale.

The thousands of live stock lovers on our subscription list who are interested in knowing how they can procure good pictures of their animals, should read the advertisement of the Eastman Kodak Co., Rochester, N. Y., in this issue. The Eastman people are the original and only "Kodak" manufacturers.

We ask special attention to the half page advertisement of Trumans' Pioneer Stud Farm, Bushnell, Ill., which appears on the inside front cover. Here is a firm which can truthfully be called one of the strongest improving firms in the development of draft horses in America. As an evidence of the good work which the Trumans have done, we call attention to the illustration in the ad showing a string of typical grade drafters sired by a stallion from one of the Pioneer Stud Farm's many importations. A fresh importation which landed April 10 is now ready for inspection.

A new remedy for jack sores, grease heel and scratches is advertised in this issue by the Jack Sore Remedy Company, Box 42, Princeton, Mo. Please note the manufacturer's statement and guarantee in the advertisement.



R. M. Fields & Son of Lee's Summit, Mo., are offering in the May 6 sale of Herefords to be held in the fine stock pavillion at Kansas City, Mo., two double standard polled bulls, and two cows. These cows are bred to Prince 5th, a double standard polled bull out of a prize winning cow shown at the World's Fair, St. Louis, Mo. The cows will calve soon. For catalog of this sale address R. T. Thornton, 1318 East 15th St., Kansas City, Mo.

One of the most important draft horse sales of the season will be held by J. C. Robison at the farm, at Towanda, Kas., May 21, when 60 stallions and mares will be sold. Send for catalog at once and make arrangements to attend the sale.

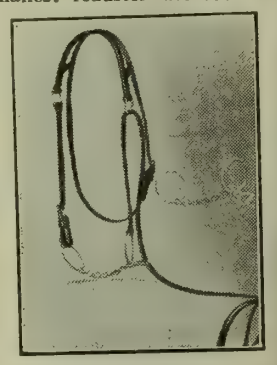
The kind of Hereford cattle going in the big sale at Kansas City on May 6 is shown by the following pointers from the contributors: Gudyell says: "As good a lot of heifers as we ever put in a sale." Z. T. Kinsell: "I am sending heifers I am proud of." Sam Drybread: "I wish I could breed them all like the fifteen bulls I am sending to this sale." John Schmitt: "I am sending only my best bulls." O. S. Gibbons & Son: "The kind that pushes the sale average up." Kansas Agricultural College: "Four useful cows, three with calves at frost and bred again." J. L. McGinnis: "Six splendid bulls of quality and size." E. E. Wall & Son: "I am sending to your sale fifteen bulls and one cow that I think will be a credit to me, the sale and the Hereford breed." R. M. Fields & Son: "I am sending you two good cows, in calf to Polled Prince, and two good polled bulls, carrying 12 polled crosses." E. W. Elliott: "I am sending four of my best cows in calf to Advertiser 10th. Ed Walton: "My three polled bulls I am sending are high class, are by a great polled sire and out of polled dams." E. D. Gorman: "I am sending the kind to advertise my herd."

GET A SPECULUM

if you want to know the condition of a mare's genital tract and whether or not it is diseased. A Speculum is also the only means of examining the cervix to make sure if a mare is in foal. Many an abortion has been caused which the use of the Speculum would have avoided.

This Speculum is made of good material, nickel plated, and with proper care will last a life-time. **SENT POSTPAID FOR $3.00.**

THE KANSAS CITY IMPREGNATOR CO.



12th and Central Sts., Kansas City, Mo.

Johnson Automatic Stallion Bridle

(Patent Applied for Nov. 10, 1909.)

Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.

"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning, Jr., at once. Send by mail. —Val. Thomas, Jr., Hopedale, Ill."

"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one.—E. A. Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not not use with a chain under his jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he can not say too much for it.—De Mott & Son, Scottsbluff, Neb."

The acknowledged standard veterinary eye remedy—$2.00 per bottle postpaid on receipt of price. VISIO REMEDY ASSN., 2475 Calumet Ave., Chicago, Ill.

system, says R. E. Olds, president of the Reo Motor Car Company. Willis Barber writes that he has just completed a run of 17,000 miles with his Reo the Fifth in which he used but two gallons of lubricating oil. He says that it is next to impossible to get his Reo engine to smoke and that he is astonished at the small amount of water which the Reo cooling system requires which is another proof of the perfect design and smooth running qualities of its motor. This is the same model Reo which R. M. Owen drove 1,460 miles as the official pilot car in the last Glidden tour from New York to Jacksonville on less than a quart of water.

Just as soon as President Wilson gets firmly settled in the White House, arranges for credit at the various stores, receives a cow as a gift (which he will name after the donor), he will dig out his bicycle and begin his famous-to-be rides through the city of Washington. For President Wilson is very fond of his bicycle and it is expected of him to put bycycling back into the favor it was in the '90s. If you want to know how we found out about this address the Mead Cycle Company at Chicago, Department 23, for a copy of their 1913 catalog.

The estate of Joseph Phillips, Hay Springs, Neb., have their Percheron stallion, Brilliant, advertised for sale in this issue.

Trumans' Pioneer Stud Farm, Bushnell, Ill., writes: "I am pleased to report the safe arrival of our second 1913 importation on the 20th ult. They arrived without a scratch on them, free from any coughs or colds and looking remarkably well; in fact they are already on sale. This importation, in addition to our February importation, and a few of our noted prize winners last fall, gives us a very complete assortment and makes our stables practically full, every stall containing a high class stallion. Our 1913 catalogue will be mailed to any of your readers that are interested in strictly high class draft horses.

Chas. Irvine of Ankeny, Iowa, writes that he expects to sail for Europe April 15th. He has sold entirely out of Belgian stallions and has to cross the water for more.

Henry Lefebure, the well known importer of Belgian horses at Fairfax, Iowa, wrote us under date of March 13, as follows: My first importation this year of Belgian stallions arrived at my farms in excellent condition today. Not one with a cold, and every horse in the best of health. Bays, sorrels and roans. This makes 120 head imported by me during the past eleven months. I have been making an early spring importation every year and find them fully as sure breeders the first season as are the horses imported in the fall. All my barns are filled full and nowhere will buyers find as large a collection of Belgians from which to make selections. All lovers of heavy draft horses are invited to come visit my stables. Catalog mailed on application.

Mr. S. McLane, superintendent of the Fashion Stock Farm, Coldwater, Mich., writes under date of April 4, 1912: "I have used Absorbine on all of my horses for a good many years in the spring, as that is the time when the horses go wrong, and I find that it is the greatest liniment in the world to keep horses' tendons right. I could not get along without it at this time of the year especially. Your Absorbine I used on Auto 2:04¼, as he hit his knee very bad and it took the soreness and the swelling out, so I could race him." If you are not using Absorbine in your stable, why not try it? You would get the same good success. Absorbine is sold at all druggists or will be sent direct from the manufacturer, carriage prepaid upon receipt of $2.00. Address, W. F. Young, P.D.F., 388 Temple St., Springfield, Mass.

There is something to learn in horse training as there is in every other business, and the man who aids practical experience by studying the best books on the subject has an advantage over one who does not. The book of Prof. Jesse Beery simply tells what this man has learned in a career so successful which has made his work famous. Read his advertisement.

An unusually good season's demand for high class draft stallions has encouraged many importers to bring over in recent shipments some of the best stallions they have ever bought. In this class we call attention to the "Belgian Emporium" of Henry Lefebure, Fairfax, Iowa, advertised in this issue.

Among the standard institutions of the live stock business in this country we must rank Alex Galbreath of De Kalb, Ill., breeder and importer of Clydesdale horses. Mr. Galbraith now writes us that he is offering for sale an importation of Percherons of the same high standard he maintains in his Clydesdales, and we have changed his advertisement to call attention to this fact. The American Breeder will appreciate being mentioned in connection with all answers to this ad.

Visio is an eye remedy for horses which is so widely used as to make the name "Visio" almost a household word. See the new Visio advertisement in this issue.

W. L. Lake of Ft. Cobb, Okla., would like to correspond with any of our readers who are in the market for a good draft stallion or mare. He also has a jack for sale.

Read Ford & Harrington's ad in this issue. They are advertising Percherons and Belgians and would be glad to tell you about them. They are located at Parker, S. D.

If you are in the market for draft stallions or mares, look up the ad in this issue of E. P. Hamilton & Sons. Garden Grove, Ia., and write them.

Write A. Latimer Wilson, Creston, Ia., for prices and particulars about the stock he has for sale.

One hundred weanling mules, the very choicest kind, are offered for sale by L. W. Hoyt, Barry, Ill.

Visit Al E. Smith's farm at Lawrence, Kas., and see his big bunch of jacks and jennets.

Scott, Abney & Jenkins of Virden, Ill., are advertising a good lot of jacks and mules.

J. C. Huckstep of Eolia, Mo., advertises his stock to be as represented and prices right.

J. T. Watson, New London, Mo., is advertising jacks and jennets at bargain prices.

Lewis Swink & Son of Rocky Ford, Colo., has 300 head of Colorado raised jacks, jennets, mules and brood mares for sale at the right kind of prices.

Anyone in the market for a Chester white hog of either sex should send to B. M. Boyer & Sons, Farmington, Ia., for a catalogue of the stock they have for sale.

C. H. White of Burlington, Kas., would like to hear from any of our readers in the market for Shorthorn cattle. He has good ones for sale.

List your property with the Real Estate Salesman Co., Lincoln, Neb., for quick sale.

Read what Henry Obermann of Friestatt, Mo., has for sale in the way of a herd jack. His ad is in this issue.

S. W. Jetton & Co. of Murfreesboro, Tenn., has jacks and jennets for sale at the right kind of prices. They are regular advertisers in these columns.

Look up the advertisement of L. Donaldson, Olney, Mo. He has stallions, jacks and jennets for sale.

G. M. Scott, proprietor of Quiet Glenn Stock Farm, Rea, Mo., says he has the best lot of jacks he has ever offered.

Notice the new ad of L. R. Wiley, Emporia, Kas., making prices on 95 head of Percheron, Belgian and Shire stallions and mares.

Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

N. B.—When we started this ad a year ago the American Breeder required us to deposit $500 with them, to insure the protection of every subscriber who bought **"Jacksorine."** We have sold several hundred boxes, and only 8 buyers failed to work a cure. These got their money back.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in a substantial box and sent promptly by mail. It is a paste and applied with a small brush three times a day.

Send money by bank draft or P. O. money order. Price $5.00.

O. P. WILSON & CO., 3754 Wayne Avenue, Kansas City, Mo.

JACK SORES GREASE HEEL SCRATCHES

With our remedy we guarantee to cure any case of jack sores, grease heel or scratches—no matter how long standing, if directions are followed. This great discovery has been used by stallion and jack owners and also by myself in my veterinary practice for a number of years, and has never been known to fail to effect a cure, even in the most obstinate cases. SUCCEEDS WHERE OTHERS FAIL. We guarantee a cure or your money will be cheerfully refunded.

Put up in pound containers which we will send prepaid PROMPTLY on receipt of $2.50 cash, draft or P. O. money order.

REMERBER: Money back if it fails to cure.

References: Farmers' Bank of Princeton. Testimonials sent upon request.

N. B. We also furnish our "Equine Liniment" at 75c a half pint .or $1.25 a pint, prepaid.

JACK SORE REMEDY CO.

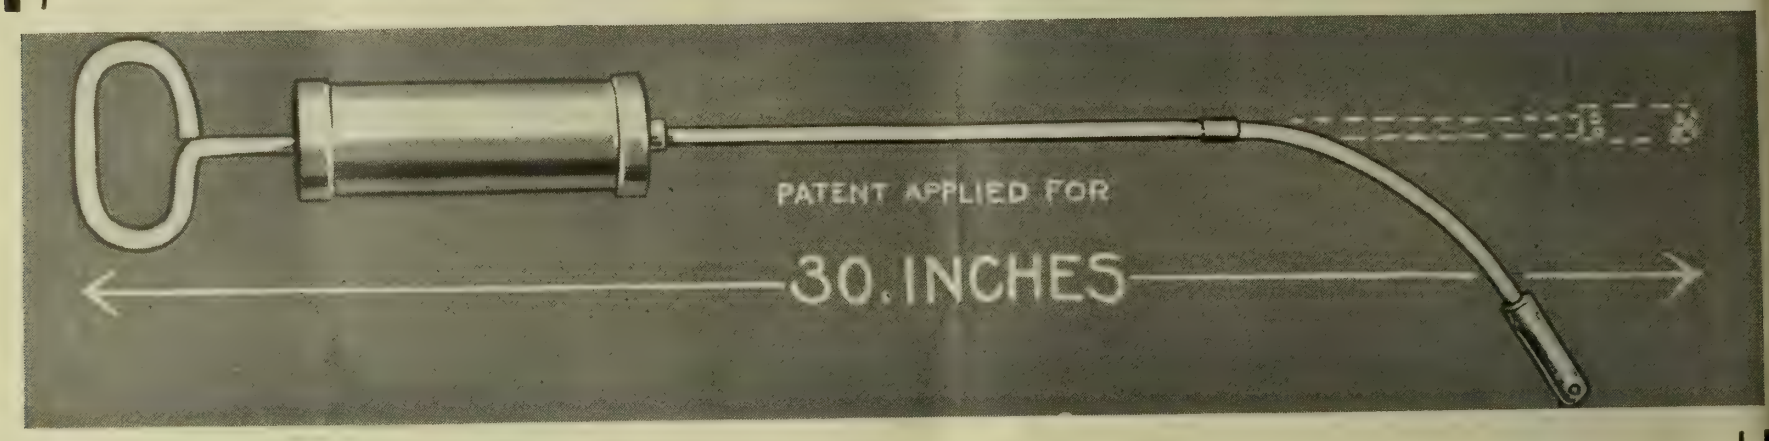
Dr. J. H. Scott, D.V.S. **G. Ellis, Mgr.**

TAIL HOLDER. (PATENTED.)

Most satisfactory and sanitary way of holding a mare's tail while breeding. These **"Tail Holders"** are a proven success. Every owner will appreciate your fixing his mare in good shape to breed. You haven't time to fool with a filthy string, which is a poor method anyhow. You can put on and take off this **"Holder"** in an instant. Send for one and if it is not as represented return it and get your money back. Price, 50 cents, postpaid, stamps or M. O.

E. E. HALL, Kincaid, Anderson County, Kas.



"More Letters Than I Could Answer"

To the American Breeder:—Enclosed find money order for my ad. Received more letters than I could answer. Success to the American Breeder, the best paper of its kind ever published. It has been worth several hundred dollars to me.—Louis Schneider, Vernon County, Mo.

BREEDING APPLIANCES OF ALL KINDS

THE IMPROVED CARLSON SEMEN EXTRACTOR AND CAPSULE SYRINGE

This extractor has been improved so that it is much easier to use. The proper temperature can easily be maintained. Anyone should have good results with this instrument by following the directions carefully. This is the only instrument made that has been successfully used for getting the semen from the uterus. We believe this instrument with its improvements will make it possible for any ordinary breeder to use the capsule system successfully. It has a soft metallic point that will stand bending a thousand times. All necessary directions will be sent with the instrument.

Special Offer: 50 pointed breeding capsules, price $1.00; a tested hot water thermometer, price $1.00; the improved Carlson semen extractor, price $7.50; **ALL FOR $7.50.**

Microscopes

For use in testing the semen of stallions or jacks. Magnifies 500 times and is used by veterinarians and physicians. Price $35.. Boxed in fine case. These instruments are of great value in the breeding business. Through them you can see for yourself and show your mare owner the live spermatozoa of your sire.

Thermometer

Tested and used for keeping water at the right temperature.

Price, $1.00.

Veterinary Thermometers

This thermometer is recognized and used by the leading veterinarians for taking the temperature of animals. It has a metal case which insures it against breaking and will last a life-time. It has a small chain with pin in it that may be fastened to the vest pocket and carried with safety.

Price, $1.25.

Curved Metal Impregnator

This instrument is sold by other dealers for from $5 to $6. It is nickel plated, about 22 inches long, with a glass tube in it.

Price, $4.00.

Breeding Hobbles

We have heretofore handled breeding hobbles made by reputable firms, but we have received so many complaints that we are now manufacturing our own hobbles. They can be adjusted to fit a small pony or the largest draft mare. We believe these are the only hobbles made large enough for draft mares. Most hobbles are made to fit the common race mare.

Price, $8.00.

Emasculator

This emasculator (improved style) is made by the Kny Scheerer Co., and bears their trade mark. It is guaranteed to give satisfaction. If it breaks within one year or gets out of order, return it and get a new one. This instrument is made of the very best steel. It is the latest method, only having three pieces and can be taken apart very easily and thoroughly sterilized. It operates perfectly. Price, $7.00.

Pointed Breeding Capsules

We have the only capsules made especially for horse breeding Some capsules do not dissolve, leaving a foreign substance in the uterus which will prevent conception. Other capsules are too flimsy to use for this purpose. You cannot make any mistake by buying capsules from us as we only have one kind. We have them boxed with 100 in each box. The box is tight so they will be clean. These capsules are properly baked and all bacteria killed before they are mailed. Always keep the lid on the box when not in use.

Price per box (100), $1.50.

Bulb Impregnator

This is the best bulb impregnator on the market. Some dealers sell for $5 and $6.

Price, $2.00.

Breeders' Bags

Three sizes, small, medium and large. Stallions weighing 1,200 or 1,600 pounds usually require a medium size. These bags are guaranteed not to tear from any cause before March 1, 1914. If they do tear before that time return the top part with our stamp on it and 35 cents in cash and we will send you a new bag.

Price each, $1.00.

Directions for Ordering

Send money orders or draft as exchange is always charged on personal checks. Always name your express office as well as your post office address in order to insure prompt delivery.

POSTAGE AND EXPRESS PAID ON ALL ORDERS.

THE AMERICAN BREEDER.

WITH WHICH IS COMBINED THE STALLION AND JACK NEWS

COPYRIGHT, 1913, BY GRAHAM PUBLISHING COMPANY.

VOLUME 6. KANSAS CITY, MO., MAY 5, 1913. NUMBER 8.

Capsule System Experiences

We have been printing statements from a number of breeders, giving their names and addresses, and telling of their actual experiences with capsule breeding. We have received hundreds of others for which we do not have space. We believe that these statements, coming from every section of the country, from reliable breeders, should convince any intelligent man that the capsule system as advocated by the American Breeder is a success.

For those who contemplate introducing capsule breeding into their communities there is no better time to start than the present. In fact, about the first of May is early enough to begin capsule breeding, because the right temperature is more easily retained. For the next few weeks every mare owner will be in a rush to get his mares bred. This is the time that stallions are injured. New beginners should be sure to breed a reasonable number of clean, heathy mares with capsules so they will have colts to show next spring. The capsule method of breeding means real money. Several hundred colts can be produced from a good sire within one short season. The possibilities are great and the owners of good stallions or jacks are standing in their own light when they do not adopt this modern method. It has come to stay, and with it the owners of good sires can practically have their competitors at their mercy, especially those who own scrubs.

Our advice to every progressive breeder who expects to remain in the business would be to start the capsule method on a substantial basis and prepare for the next season by getting as many customers to read the American Breeder as possible. Those who read this publication will be in sympathy with modern methods and better sires. The statements which follow, represent so many different localities that most of our readers will be able to find among them letters from men they personally know. No better evidence of reliability can be put in print.

"Will say that I used capsules and the Carlson semen extractor last year and had splendid success. I consider it would pay any man who is in the breeding business to prepare to use capsules, whether he is crowded or not, for he can fertilize some mares that will not settle with the natural service, and there certainly is no difference in the colts. I had quite a bit of trouble convincing some of my customers last year, but there is not much kick so far this spring. Wishing success to all, I am.—M. W. Goode, Binger, Okla."

"We feel that the capsule system of breeding is the most profitable method of breeding for both stallion and mare owner. As to the kind of colts from capsule service, we can show one of our pure bred Belgians that weighs 1,175 pounds at one year of age. He weighed that on his birthday. There are plenty of other capsule colts in this neighborhood that are extra good for grades. Some mares no doubt conceive more readily from capsule service.—M. M. Clawson & Sons, Okeana, Ohio."

"Anyone who keeps stallions or jacks for public service should (if he has not already done so) prepare to use the capsule system as taught in your valuable paper, thereby saving the unnecessary waste of the horse or jack. The colts are just as good as those gotten by natural service. I have a four-year-old stallion gotten by artificial insemination and I think he is as good as any one has.—Ben L. Washburn, Carterville, Ill."

"I think the capsule system is so

FAILED SIX YEARS; CAPSULE SERVICE GOT A COLT.
This 17-year-old mare, belonging to Henry Van Hoose, Harris, Ark., had not foaled a live colt for six years, when she was bred with a capsule, in 1911. The mule colt from that service, shown herewith, was carried full time and was three feet and seven inches tall when foaled.

profitable that I am adding improvements designed especially for convenience in its use. Can see no difference in the quality of colts. We use the capsules on our own mares because it takes less time than to breed to the horse. Can breed six mares in less than two minutes.—C. M. Jennison, Farnsworth, Kas."

"I want to say that the capsule system is a profit to anyone and that the colts are equally as good as those had by natural service. Some of the best horses we have on the farm were capsule colts. You can also fertilize mares with the capsule when you fail with natural service. To sum it up in a small space, I can't do without the system.—W. D. Berkey, Iowa City, Iowa."

"We have mares in foal that failed by service of the horse and caught by capsule service. Three of our public colt show winners last September, were gotten by the capsule. Our patrons are now convinced that the Graham system is a benefit all around. —R. R. Pittis, Scio, Ohio."

"In regard to the capsule system, I am sure that it will pay anyone in the breeding business to use it if they will follow instructions, and I see no reasons why the colts are not as good as the ones gotten by natural service. I am sure it is more apt to settle hard mares than the natural service.—Wiley Clouston, Jr., Ness City, Kas."

"I have had good success with capsules. It is easy to foal a mare with a capsule when the weather is warm, and it is lots easier to foal a jennet with capsule than with natural service. As to the colts, I can't see any difference.—J. E. Moffet, Chismville, Ark."

"The capsule system as taught by the American Breeder is certainly a success if the operator will follow the instructions as taught. Will also say there is no difference in a capsule colt and one gotten by natural service. I have had three years' experience and have had good results from capsule breeding. I have foaled mares that I had failed to foal with the natural service until I had lost hopes of them, by using the capsule. No breeder need be afraid of the system just as long as the operator does his part, as taught by the American Breeder.—H. Bonham, Cordell, Okla."

"It is profitable to use the capsule system and the colts are just as good, and lots of mares are more easy to fertilize by capsule. On May 23, 1911, I bred five mares to my jack and got six mules—one had twins—all with capsules. I have fertilized lots of mares with capsules that would not breed any other way.—Theo. Tacha, Jennings, Kas."

"I have had very good luck breeding mares with capsules. I think it will pay any breeder well to adopt that system of breeding. Others are asking if the colts are as good. I know the colts are just as good and some mares are very much more easily fertilized than by the natural service.—Claude White, New Franklin, Mo."

"Will say I believe your course as taught in the American Breeder is very profitable to those expecting to use the capsule system. Capsule colts are just as strong as any others. Some mares will fertilize with capsules that won't any other way.—A. S. Miller, Hinton, Okla."

"The capsule system of breeding, as taught by the American Breeder, is the only way. The colts are just as good from capsules as from natural service, and mares are more easily fertilized with capsules, as the semen is put in the right place where otherwise it might not be. Have practiced artificial insemination for five years and would not go back to old methods. The horse breeding lessons now printed in the American Breeder will do more good than anything I ever saw. Success to the American Breeder, as I cannot get along without the paper.—G. Nordquist, Canton, Okla."

"As to using capsules, will say the colts are just as good. I have no trouble in getting the semen from the horse, but cannot get anything from the jack's service, that is, not very often. Have a few capsule mules and they are just as good as breeding the old way.—G. L. Anderson, Cashion, Okla."

"I have used the capsule system for three years and will continue to do it, as taught by the American Breeder. In careless hands and untrained hands it might be a great disappointment and a failure, yet it is scientific and right and when properly learned, will give the results claimed for it.—J. T. Axtell, Newton, Kas."

"I could not hold any trade without capsule breeding. Have colts that won premiums, and one stallion I raised sold for $1,800. Also have mares

that have colts, so know both sexes are absolutely as good as from the natural service.—J. U. Knox, New Florence, Mo."

"I wish to say that the artificial method of breeding, as advocated by you, is a success, and absolutely a necessity to anyone who stands stallions or jacks.—A. T. Ling, Greeley, Colo."

"It certainly is profitable to prepare to use the capsule system as taught by the American Breeder. The colts are just as good in every way. I have fertilized mares with the capsule that have been bred for years by the natural service and failed.—E. P. Ferris, Haskins, Ohio."

"I consider the capsule system one of the best things out for the stallion or jack owner, and also for the mare owners, for the simple reason that we can prevent spreading disease by using the capsule. We can breed a clean mare with the stallion and catch the semen and breed mares that should not be bred by the natural service, and by this means we can keep what clean mares we have without spreading infection. Capsule colts cannot help but be just as good as from natural service. I am sure we can settle some mares with capsules that we could not with natural service.—G. A. Ferrel, Louisburg, Kas."

"Will say the capsule system as taught by the American Breeder is no experiment. It is an established and proven success. I have been very successful in my practice and have been able to settle quite a number of mares where natural service utterly failed. There is absolutely no difference in the colts. Many patrons prefer and demand this service. When you consider the saving of the horse, the vast amount of time and the uncertainty of results by the old method, in many instances, no man can afford to be without it.—J. H. Motley, New Hartford, Mo."

"In reference to capsule breeding, I will state that capsule breeding properly and systematically done, attended with cleanliness, is a success, as practiced at my barn. The colts are just as good and I can show them to speak for themselves. If what I say is not true, I will sign a libel and quit the business. The capsule has brought the services of high priced horses within the reach of all. If you put away the capsule, high prices will return.—K. F. Hawkins, Seymour, Tex."

"In regard to whether or not it is profitable to prepare for capsule breeding, will say that no man who owns a good stallion can afford not to use the capsule system. The colts are just as good as those by natural service, and as for getting mares in foal, I use capsules when everything else fails.—Nels A. Anderson, Farragut, Iowa."

"Will say in regard to capsule breeding with three years' experience, that the capsule system of breeding is a success when handled right, and the three great essentials are cleanliness, right temperature and excluding direct sunlight. I would not stay in the business at all if I had to go back to the natural service system. The greatest trouble with the natural service system is that you serve more than once a day. I think that is a mistake, and I base my conclusions on the microscope. I find so many more germs and the stallion is much more vigorous where only one service is employed.—R. W. Davis, Wolbach, Neb."

"No one should be without the knowledge of scientific horse breeding, as taught by the American Breeder, who intends to stay in the breeding business, whether he be stallion or mare owner. There are some mares more easily fertilized by capsules.—W. R. Clelland, New Hampton, Mo."

"I take the pleasure of writing you in regard to capsule breeding. As this is my third year of breeding with capsules, I can say without a doubt that it is a very successful business. My customers are calling for this kind of work, as they can see for themselves what I have done in this neighborhood. I know the colts are just as good as natural service colts, and I am sure I settle one-third more mares with capsules than I did with all natural services.—H. O. Lackey, Birds, Ill."

"It is worth any man's time to prepare for capsule breeding, if he never uses it, as it better prepares him for natural services. I use capsules some and get good results for what experience I have had, and my conveniences to work with. Some mares, it is true, are more easily fertilized with capsules because you put the semen in where it should be. I have three colts from one mare that will not breed any way except by the artificial method, and the colts are just as good as any natural service colts. Watch for disease if you are breeding many mares. I have mares that come to my barn that are diseased and turn them down if the man will not let me treat them. I have treated them and gotten them in foal 21 days after. You are no exception; you must be able to detect it; if you don't, you are not equal to your job.—H. M. Justice, Stilwell, Kas."

"I am doing better every year with the capsule system; the colts are fine and the capsule breeding is all right if one follows instructions. But for profits the mare must be healthy, the horse must be right and you must be right and you will get colts. I do not breed if the weather is colder than 70 degrees.—D. S. Blakey, Spirit Lake, Iowa."

"I have used the capsule plan for one season, and this is the second season, and I find it entirely satisfactory. The colts are better, as you don't have to work the stock so hard, and the mares are easier fertilized with capsule than with the natural service.—Walter L. Doyle, Krum, Texas."

"Will say that the mules got by capsule service are just as good as those got by natural service. I have foaled some mares with capsules that had not been in foal for several years. I am sure it is the safest and surest way to breed. My trouble is in getting the semen every time. There is no doubt about it foaling some mares that won't settle straight.—J. W. Gillum, Wing, Ark."

"No practical stallion or jack man can afford to do without adopting the capsule way of breeding, and I consider it surer than the natural service and can tell no difference in the colts. Wishing you the success that is due you.—C. E. Hodgden, Galesburg, Kas."

"The capsule breeding is a success in every particular, but anyone to do successful breeding should understand the method in every particular; also be very careful about diseased mares. Speaking for myself, I have been very successful, but still learn something every season.—T. M. Allinder, Conway, Ark."

"A stallion owner must prepare to use the capsule system as taught, for it is the only way. The colts are so good that the mare owners prefer the capsule breeding in place of the natural service. I know beyond a question of doubt that mares are more easily fertilized with a capsule than with natural service. I had a mare come to my place that was bred two seasons to a jack, and once the jack owner said he could not get her in foal and told the man to see what 'Moormann' could do with the capsule system. The result is a black stud colt and a good one. A good many mare owners have been watching this particular mare, and now we are just commencing to advertise. The other fellow is just as proud of the colt as I am.—J. H. Moormann, Solomon, Kas."

"Will say that it is very profitable to prepare for the capsule system. No breeder who expects to make a success of his business can afford to be without the information given by the Graham Scientific Breeding School. I bred 200 mares last season, 100 with the capsule and 100 with the natural service, and I have a better per cent with the capsule than with the natural service. The mares that I bred with the capsule were a sorrier grade than the ones that were served by natural service. Many of the mares that I bred with capsules are ten and 12 years old and never have brought a colt, but are going to bring colts this spring. The colts are just the same. Some mares are fertilized with the capsule system that never could be with the natural service. I would not undertake to breed without this system. I say hurrah for the capsule system.—Henry Highfill, Paragould, Ark."

"It is profitable to use the capsule breeding system as taught by the American Breeder. The colts are as strong got by the capsule system as by natural service. Some mares will fertilize more readily with the capsule system. I am more than pleased with the American Breeder and Graham's Scientific Breeding School. I am going to collect about $720 from a coming four-year-old horse. Out of 62 mares bred last year only 14 have failed so far, and four of these lost colts.—E. A. Wallace, Dallas City, Ill."

"I have been using the scientific breeding method for years and would not do without it. The colts are just as good and it is just as easy to get four or five colts at one cover as not. I have foaled mares the first time that never had a colt and had been bred for years. My patrons think it is all right.—W. A. Earp, Strand, Okla."

"Some mares are more easy to foal with capsules because of the abnormal condition of the neck of the womb, and the colts are the same as any other colts. The system is worth the study of any man who handles jacks or stallions.—C. C. Cole, Six Mile, Ark."

"The colts got by the capsule system are just as strong as those got by natural service and as for fertilizing some mares that could not get in foal by natural service, it can't be beaten. I have a mare that I bred two years by natural service, and got no colt until I used the capsule. Her colt is coming one year old and the owner is well pleased with the success of the capsule service. I have a 17-year-old mare that has one yearling and a suckling that has not been served by a horse in nine years. How is that?—T. U. Williams, Charlotte, Iowa."

"I am having good success with capsule breeding. If done right, there is no mistake about it. Colts are foaled stronger than with natural service. I got a greater per cent of foals with the capsule method than without it. I would not handle the business any other way.—S. C. Williams, Eldorado Springs, Mo."

"It pays to breed with the capsule system, as taught by the American Breeder. It pays the horse man well and the mare owner better. Any mare you can fertilize with a horse you can fertilize with a capsule. Then there are mares you can fertilize with a capsule that you cannot by natural service. Test your horse and jack; have the right temperature; use two or three hot water thermometers, then you will be sure and have the right temperature; then follow the instructions given by the American Breeder. My customers are well pleased with the capsule system.—W. F. Dimick, Kiel, Okla."

I think it is indeed profitable to prepare to use the capsule system of breeding, as taught by the American Breeder, to the stallion owner, as well as to the mare owners in his community, as there are some mares that can be made breeders with the capsule that would otherwise be barren. It is also very important to learn to tell when mares are in breeding condition, and in my judgment, if every man offering a stallion for public service would be required to pass an examination, such as would prove him to be qualified for the breeding business, and also be some judge of conformation, it would do more for the breeding interests than any of the stallion laws.—Wm. Freitag, Minier, Ill."

"The capsule system is profitable and the colts are just as good. I got mares in foal last year that had not been in foal for six and seven years. I expect to use the capsule system for all time to come. I find that the more particular and careful I am, the more success I have.—I. C. Evans, Troy, Iowa."

"I have used an impregnator for several years and have got mares in foal that could not be got in foal by natural service of a horse, and the colts are just as good and strong as those got by the natural service of a horse. The capsule system is the only way to breed mares that are hard to get in foal, and you can breed more mares and get a larger per cent in foal and not hurt your horse by using the capsule system. To have success you will have to keep things clean and sterilized.—Carl Henning, Corning, Kas."

"Will say that the capsule method of artificial insemination is beyond doubt the most successful and up to date way of breeding. In fact, the only way we can use high class sires at the price that the average farmer will pay. I think if every breeder would take the American Breeder and study it he could without doubt increase his number of colts. Have tried to get every mare owner that would read it to subscribe.—J. Frank Dye, Flemingsburg, Ky."

"I have been breeding mares with capsules as taught by the American Breeder, for several years and find it satisfactory. The colts are just as strong as any other way and it is more sure on all mares.—M. M. Chaffin, Pataskala, Ohio."

"I would like to give my idea of the capsule system, as taught by the American Breeder. Any breeder can use the capsule system profitably, if the instruction of the American Breeder is followed. Colts are just as good and just as strong from capsules as from the natural service; also there are mares that are much easier to fertilize with capsules than any other way. I have used the capsules for the past two years and can show as many colts from capsules as from natural service. I would quit the horse business if I had to go back to the old methods. I could fill pages in praise of American Breeder and the Graham Scientific Breeding School.—D. B. Coffin, Dunkley, Col."

"I think the capsules are a success. I used them last year with good success. Lots of farmers don't want me to use anything else on their mares this year. The Carlson Semen Extractor is a fine thing; I could not get along without it. Capsule breeding will be the only way to breed mares in a few years.—B. W. Stites, Hiawatha, Kas."

"We had good luck with capsules.

(Continued on page 12.)

Questions and Answers.

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best autherities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

HEIGHT OF MULE COLTS—Will you please give me the usual height and measurement of a mule colt when foaled?--Illinois Subscriber.

REPLY—We would be glad to publish a few statements from breeders concerning the measurements of mule colts at birth. These measurements should give the height, girth and bone below the knee. We do not wish to encourage long legged jacks.

TWO YEAR OLD STALLION—I have a fine registered Standard bred harness stallion, registered under Rule 1. Will be two years old 21st of this month, is 15 hands and three inches by standard measure, and as large at flank as girth; 17½ inches around hock. Should this colt serve any mares this spring, if so, how many? Will he not be a better horse next year if not allowed to serve any this spring?--Tennessee Subscriber.

REPLY—Your stallion will be a better breeder, in all probability, by not allowing him to tease or serve a mare this year, but if you wish to serve a few mares with him the teasing should be done with another stallion, and as soon as service is made take the colt away where he won't see or smell a mare in heat. Do not allow him to use a paddock where mares have been bred, as he is liable to acquire the habit of masturbation. About 20 mares might be served this season. Do two services closer than one week.

ABORTIONS—Why will a mare be regular in heat before she is bred and then will refuse the horse for a period of six weeks or two months, and come three? These mares are tried back regularly. I have had considerable trouble along this line.—Iowa Subscriber.

REPLY—These mares are probably fertilized but abort at a later date. Such mares should be bred during the fall. If there are many of these mares you should watch closely for contagious abortion. Read the article in this issue on "Contagious Abortion."

CERVICAL PLUG—What do you think of the hard rubber tube that is advertised so extensively to go in the uterus or womb of a mare that is hard to get in foal.—Iowa Subscriber.

REPLY—These hard rubber tubes were used some years ago, but have usually been dispensed with. Stallions do not serve very well where these are in use. Some stallions have been ruined with this method. Breeders generally have come to the conclusion that they have very little value. When the cervix is open enough to insert one of these plugs, there is very little use for it. When the cervix is closed, and one of these plugs is used, it often sets up an irritation, as they are too large. The proper thing for you to do is to get familiar with the capsule system, which any ordinary breeder can do if he will read the instructions.

ALFALFA FOR STALLIONS—Is alfalfa hay good feed for a stallion to feed through the season?—Kansas Subscriber.

REPLY—If your stallion is accustomed to alfalfa, a reasonable amount should not be injurious, but it is not advisable to make a sudden change in feed of any kind. One-fourth of the roughness might consist of alfalfa.

KEEPING YOUNG JACKS TOGETHER—I am raising jacks and would like to know if it is necessary to separate them or can they be kept together without damage to the jacks, provided they are kept from jennets and mules? If necessary, when should they be separated, at what age?—New Mexico Subscriber.

Reply—Some breeders keep their jacks together until they are a year and a half old, but it is generally considered a good policy to separate jacks at from eight to twelve months and give them a filly colt as a mate, for best results.

CONTROLLING THE SEX—Is there any certain time to breed a mare to get a male colt, or any way? If so, please tell me how and when. Some claim there is a time to breed to get a female colt and a time to breed to get a male colt.—Texas Subscriber.

REPLY—We do not believe that there is any way to control the sex.

BRED WHEN NOT IN HEAT—When should mares be returned that are bred when not in heat?—Oklahoma Subscriber.

REPLY—Mares bred when not in heat should be returned for retrial on the 30th day and once a week for three weeks.

IN-BREEDING STOCK—I have a good Percheron that I want to breed to his fillies. Would that be all right. I want to do the same thing with my Hampshire hog. Please advise me.—Oklahoma Subscriber.

REPLY—The leading breeders in this country do not follow this practice. If the sire and the progeny are perfect, some results might be obtained, but a defect produced by this method will be very hard to eliminate. We would not advise this method of mating excepting in the hands of expert breeders who are thoroughly versed in conformation and breeding principles.

ROUGH SERVER—I have a stallion that I got this spring that is ten years old. When he starts to serve a mare he will rear almost straight up and then light on mare. What can I do to keep his from going so high up in the air? It makes no difference how far you are from the mare, or how near, he will rise straight up and usually lights too far front on mare. I know nothing about how this stallion has been trained to serve a mare, but have heard that he was broken by turning loose in lot with mare.—Tennessee Subscriber.

REPLY—Thoroughly break this stallion with a severe bridle so you can handle him anywhere. Teach him to come up within a few feet of the mare and stop still until you give him a signal to mount. This can be done in a reasonable length of time. Take the mare in the left hand and the stallion in the right hand; let them be facing each other. When he mounts, if he goes to rapidly, he will go by the mare. This will discourage him from going too rapidly.

BREAKING A YOUNG JACK—I have a young jack two and a half years old and I cannot get him to get ready to serve. He will mount and tease the mare and act like he wanted to serve, but don't get ready. I haven't the right kind of a mare to turn them out together. What can I do to make him get ready? I have been feeding him a little green wheat. Is that good?—A Subscriber.

REPLY—Be sure that the mare is in good heat; one that he can serve easily. Handle him very quietly; bring him out and let him smell the mare a little and if he does not get ready, put him back in the barn and take his bridle off; after a while bring him out again and give him another chance. Do not teach him to stand around for an hour or two, as he will always want to do that. Do not turn him out with a mare. If you will take a little time you should have no trouble with a young jack, but do not let him see or smell a jennet or a mule under any consideration. Just take plenty of time and break him right. A little green feed is not injurious. Be very kind with him so that he will not be afraid of you, or anything else.

MARE WON'T COME IN HEAT—I have been trying a mare all last summer and this spring she won't horse. She is the first mare I struck that I could not make horse. Her cervix is open all of the time. She is five years old. Please tell me what to do to make her horse. Have been in the horse business for 36 years and this is the first case I ever saw like this. I always open up the cervix to make them horse. Never failed before, but this one is open all of the time. This mare never did horse.—Iowa Subscriber.

REPLY—Breed this mare with a capsule containing live spermatozoa and send her home. She perhaps comes in heat at regular periods, but they are too short for you to find them; they may only consist of a few hours. There is one difficulty with breeding out of heat and that is that one should always be careful about rebreeding them. The examination should always be made with a speculum and not with the hand.

SLOW STALLION—Have you a remedy for a slow horse? One of mine is inclined to be a little slow but he is sure.—Iowa Subscriber.

Reply—Gradually change the feed to oats and diminish the hay ration. Make the roughness a little more laxative, such as clover or alfalfa. Oats will supply this deficiency perhaps as good as anything you can use for this horse. By diminishing the roughness he will not be so sluggish.

A RANK JACK—I have a fine jack; is quick to get ready and works fine and stays on plenty long enough but always comes off with the head of his penis enlarged. Have bred about 20 mares and he works about the same on all of them; have tried two mares back and both refused on the 21st day. This jack eats oats, prairie hay and bran; has half or three quarters of an acre corral. I would like to know why he comes off proud and if he is apt to prove a sure breeder. Only breed one to two mares each day. The jack is quiet and not afraid of the bridle or anything else.—Kansas Subscriber.

REPLY—Try to encourage your jack to stay on as long as possible. You may work him out of this habit of getting down too soon. Some jacks that have this difficulty produce a fair per cent of foals, but, as a rule, they are not very sure. They do not deposit the semen in the uterus as often as they should. The capsiule system, however, would help this defect because the semen could be put in the uterus where it belongs.

EVERY OTHER YEAR MARE—I have a mare that won't breed only every other year, and as this is one of the years to miss I would like to know if there is anything I can do to make her breed every year. Any information on this subject will be appreciated.—Mississippi Subscriber.

REPLY—If you will breed this mare on the seventh day with a capsule without teasing her, she should fertilize again. Be sure that the stallion discharges live spermatozoa at that service.

DOUBTFUL JACK—We have a jack four years old that fails to discharge much semen. He is a large jack and in good shape. Feed oats, clover and timothy hay. Last season he was bred to about 50 mares as a three year old and made two services a day sometimes. Was foundered along in the summer. Does that affect them from a producing standpoint? He has had no exercise the last winter, just on the farm. He is not long in getting ready, but what little discharge there is, is watery and foamy looking. To date there has been 14 returns and all bred again but three. We are just using him once a day now and using the capsules, but there is so little discharge that we can hardly get any. What do you think is wrong? Was he used too much last season to affect him now?—Illinois Subscriber.

REPLY—Your jack had too many services last year and the founder was also injurious. We would advise making a test of the semen. When the weather gets warm you should expect better results. Be very careful that he does not get foundered again, as it is liable to return. Keep his feet in good shape. If his appetite is not good, feed him a little green stuff, enough to make him relish his feed.

JACK WILL NOT SERVE—Please let me know what I can do with a young jack so that he will serve a mare. I have tried him two times but he will not serve a mare. The jack is four years old October 22, 1913. Any information as to what to do for this jack will be appreciated.—Missouri Subscriber.

REPLY—We cannot give you much advice on this jack from the description. Be as gentle as you can with him and do not try to breed any except very gentle mares in good heat.

JACK WON'T MOUNT—I have a fine jack; gets ready to serve mares but will not make the leap. Would the remedy mentioned for slow jacks cause him to make it? I have not had much experience with jacks. This is a young jack; served three jennets last spring and one this, so I was told. He gets wild at sight of jennet, but gets ready for mares. What can I do to get him to serve mares? I want him for mare jack. Do you think the remedy would make him work better. I have only tried him on three mares; the first did not show signs of being in heat; next he seemed to get rank and scuffle with her; got ready at least 25 times quickly. She was in heat but he would not make the leap. The next mare was in heat and would show signs to horse, but none to jack, at which she kicked and bit side of pit. That seemed to scare him and he would not pay farther attention to her. Any advice on how to break this jack would be thankfully received. He is a fine individual and as it is I am losing valuable time. Perhaps some one through your paper could help if the editor does not know.—Illinois Subscriber.

REPLY—We do not have any remedy for slow jacks. The difficulty with your jack is that he has been spoilt. Do not try to breed a mare that is not perfectly quiet. If you will handle this jack and get thoroughly acquainted with him so that he is not afraid of you, you may be able to get him to mount if he gets an erection. Put your mare in the pit and put a twitch on her nose so she will be sure to stand quietly; bring your jack out quietly. Push his head up over her back and "cluck" to him, when he is ready. At the same time quietly run your thumb into his ribs a few times gently. Do not crowd this method, as it may spoil him. If you have paid particular attention to the many articles in this paper on slow jacks you should have much information by this time. You might also get a small mare in good heat and try her outside the pit. Let the mare take a step or two as though she might get away. This sometimes encourages jacks to make a mount. Be careful that your bridle is not too severe. Do not let him see or smell a jennet. You may be able to get him out of the notion of wanting a jennet. If everything else fails it may be necessary to get a jennet for him to look at, but we believe you can finally break this jack if he gets ready without a jennet.

MIXING WATER AND SEMEN—I see that in the Carlson semen extractor there are two holes which will let water in on the semen. Does it hurt the semen for water to mix?—Iowa Subscriber.

REPLY—The opening in the rear end of the extractor does not admit water to the semen; the plunger is always between the water and the semen, but if a little sterilized water should be mixed with the semen, it is not injurious.

STERILIZED WATER—What do you mean by sterilizing water to rinse the hands, water that has been boiled or with some disinfectant? I have always used the hot water. I am of the opinion that a disinfectant would be dangerous for semen to come in contact with: even the scent of it will kill bacteria and germs and it looks like it would kill the semen or spermatozoa. Is there any harm in filling the capsule full or must they be only half full?—Subscriber.

REPLY—Sterilized water is boiled water. Do not use any disinfectants in your breeding operations. The best way to clean your hands is to thoroughly wash them in soap and water, and rinse in sterilized water. The object in filling capsules half full is to keep the ouside dry. One half full is sufficient.

BREEDING YOUNG MARES—I have two colts, one is coming two years old and one coming three years old. They are light driving mares. I would like to have some colts. Would they be too young to breed or not? What kind of mules would they raise? I have a

good jack, stands 14 hands high, 60 inch heart girth, 9¼ inch below knee and weighs 1010 pounds. He will be three years old next September. What is your advice; would you breed them or not?—Ohio Subscriber.

REPLY—Your mares are not too young to breed if they are well developed and you are in a position to care for them properly. They should raise you very nice mules.

SHY JACK—I have a jack I bought this winter. He is eight years old, in good shape and covers a mare any time, but does not seem to settle any of the mares. I have bred two of my own to him twice. He seems to get ready in the barn a good many times when there isn't any mares around, and at times his testicles swell, sometimes one and sometimes both. He has a paddock 24x16 to run in at any time. Will cover a mare even if testicles are swollen. He has a good many colts to show and mares in foal to show that he has been a sure breeder. Is there anything I could do for him? Does it take a stronger microscope to see the spermatozoa of a jack than a horse? How strong should it be. I read the American Breeder, but have not seen a case like this.—Kansas Subscriber.

REPLY—It might be well to get a veterinarian and make an examination of this case. He is not likely to be of any service to you while the testicles are swollen. It may be necessary to withdraw him from service for some time. A microscope of 100 diameters will show the spermatozoa but 500 diameters is much better. The spermatozoa of a jack may not average quite as large as that of a stallion, but there is very little difference. There is, however, much difference in different animals.

TEMPERATURE OF MARE—Nearly all of the mares' temperatures run up to 100½, only one as low as 99. Is this temperature too high or is it climatic conditions? All look healthy. I had one mare this spring that I bred to the jack two years ago and she caught from first service. The party has been breeding her closer to home and could not get her settled, so came back here. Now I made an examination and found a covering over the mouth of the womb; made natural service and found all the semen in the vagina and then used the extractor as an impregnator as that was the only mare that day.—Idaho Subscriber.

REPLY—The average temperature of mares in a breeding condition is about 100 degrees. We would not consider that the temperature was too high.

A FRIGHTENED JACK—I bought a jack this spring that worked all right on 20 mares and quit off all at once. When he does get ready he won't get on. Could you tell me what is the matter? Could it be that he abuses himself?—Kansas Subscriber.

REPLY—Your jack has probably got caught in the pit or been frightened in some way. This is very easily done. If you have been using the pit we would advise trying him without the pit. Either hobble your mare or twitch her. Be very gentle with him until you get him over this scare. Many good jacks have been ruined by carelessness.

A PARTICULAR JACK—I could like to ask you what to do with my jack. He is four years old and has always been somewhat slow. I bred a few mares to him this spring and he worked quite well, but I tried to breed a mare day before yesterday but he did not get ready. I fooled with him three hours so the mare had to go home. Last evening this man came back again to breed the same mare, but the jack did not serve her. Please advise me what to do. He is a good jack and in good condition. He is in a barn where there is a lot of other stock of all kinds. Would it be better if he was kept away from other stock? —Nebraska Subscriber.

REPLY—When you have another mare of this kind we would advise you to get a mare that the jack likes, then he may get ready quickly. In other words use another mare as a teaser for him. If he does not get ready for other mares perhaps you have done something not to his liking. Be very careful with a young jack that they do not get frightened.

OPEN WOMB—Where a mare's womb is too loose and they won't get with foal, is there any harm in putting a small piece of alum in the mouth of the womb to close it up after the

(Continued on page 13.)

AMERICAN BREEDER'S SCHOOL (Horse Breeding LESSON III)

Physiology of the Genital Organs

This is one of a series of lessons prepared expressly for the thousands of our readers whose business requires thorough, systematic instruction on breeding subjects, but who so far have been unable to get away from their homes to take, personally, a regular course of study in a breeding school. These lessons do not in any sense constitute a "correspondence school"—they cost nothing to our subscribers and no "diplomas" are given. We are simply going much farther in the direction of careful, practical instruction on an important but difficult subject, than any agricultural publication has heretofore thought of going, knowing that such a series of articles, if properly studied, will be very valuable, both to those who follow it later in a regular school, and to those who cannot. As a feature, or department of this paper, therefore, we offer the "American Breeder's School" to the thousands of breeders on our lists who seek advancement in their business. As long as our supply lasts we will send the issue of April 5 (which contained the second lesson—"Generative Organs of the Female")—to every new subscriber who requests it. One dollar for a year's subscription to the American Breeder is all we ask any one to pay for the full series.

Estrum is a term signifying a desire or willingness on the part of the female to copulate with the male. This condition does not usually manifest itself until the female has reached a state of physical development that fits her to bear young. The most of animals in their wild state only experience estrum once or twice a year while under domestication it may appear at stated short intervals.

During this period the female is in a more or less state of mental excitement, the genital organs are congested and swollen and the female seeks the company of the male.

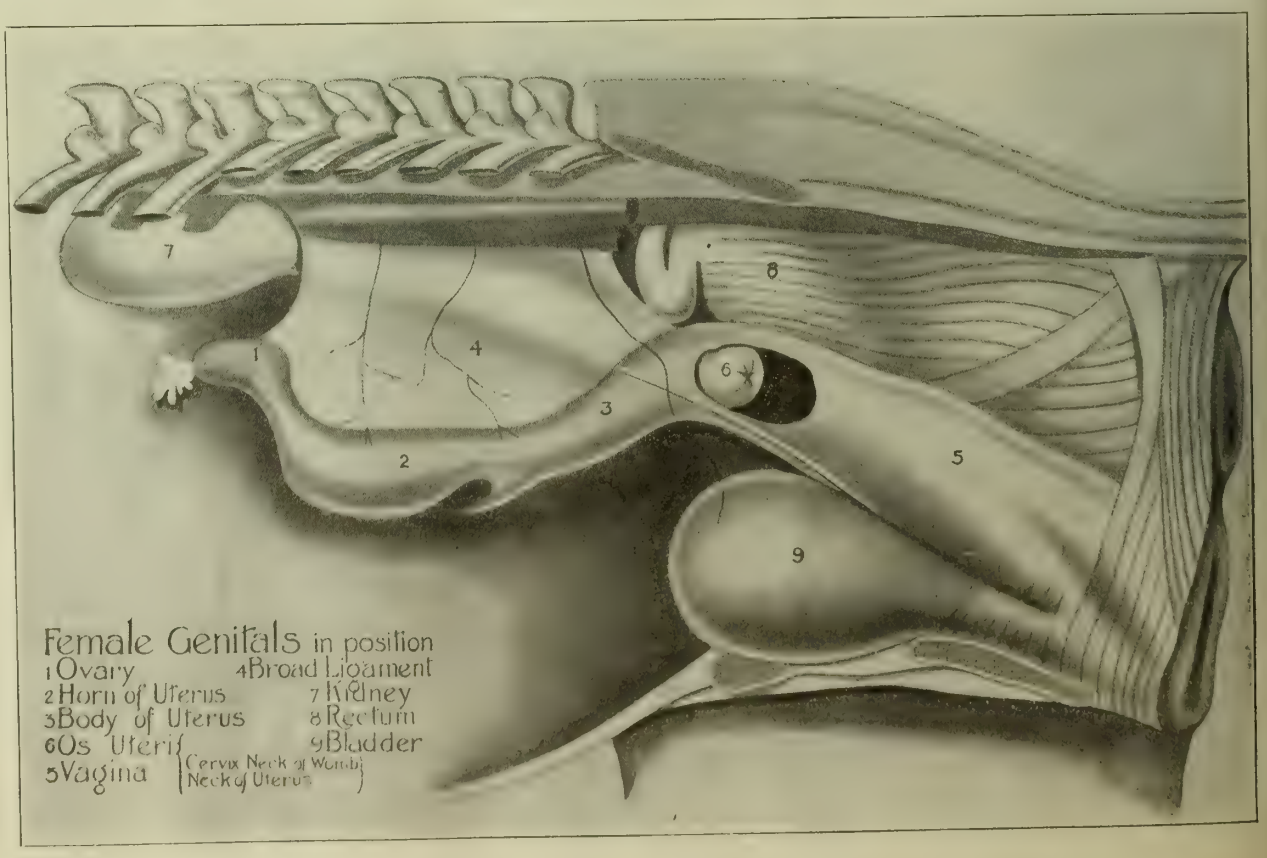
Estrum is closely associated with the release of the ovum from the ovary. In fact, in the great majority of the domestic animals it precedes ovulation. Nature has made no mistake in this regard for by so doing an opportunity is given for spermatozoa to become spread throughout the genital tract so that when the ovum is released it will be promptly met by the active male cells.

In the mare it has been fully demonstrated that the ovum is not released until from three to five days after the close of the heat period which fact may be taken advantage of in practicing artificial breeding on certain classes of mares. In some cases it has been found better to wait a couple of days after the heat period has passed before inserting a capsule, and many mares have been made reliable breeders again by this method that resisted all other attempts of getting them with foal.

The ovum is the female contribution towards a new life. It begins its development within the ovary, being a primary cell that was invaginated into the interior of the ovary from the surface of the latter. Many hundred of these cells are invaginated in this way into the substance of the gland during foetal life where they lie dormant until such time as they are aroused to development. When a certain cell begins development there is arranged about it a capsule which contains fluid and as the process of growth goes on both the cell and capsule enlarge and it forces in the direction of least resistance until it reaches the surface of the ovary when it bursts and releases the ovum. The projecting fimbria catch up the ovum and conduct it into the narrow uterine duct along whose tortuous course it is slowly propelled by the waving cilia that line the latter. It is estimated that it may take as much as three days for the ovum to pass through the entire length of the uterine duct, which in its restricted confines gives every opportunity for the active spermatozoa to meet with it.

The male cells or spermatozoa are developed within the convoluted tubules of the testicles and are to begin with primary cells lining those structures. As they develop they begin to take on the form of the future spermatozoa and in due time an appendage or tail is developed which enables them to move from place to place. This automatic power is essential when we take into account the rather remote distance they are deposited from the object of their search—the female cell or ovum.

While it has been repeatedly demonstrated that the stallion deposits the semen in the majority of cases within the uterus, yet in many cases he does not. In the event the semen is deposited in the anterior part of the vagina the spermatozoa must of their own power pass through the cervix, across the body of the uterus and up through the horns into the uterine duct before successful impregnation can be accomplished.



As the spermatozoa leave the testicle and come into the presence of the secretions provided by special glands they seem to take on greater activity and power. It is essential first that the spermatozoa be at the very highest degree of vigor, and it is likewise important that that vigor be maintained by healthy stimulating secretions.

During the normal copulation the upper part of the body of the penis is the portion chiefly erected, the lower part and head not undergoing complete erection until ejaculation begins.

This feature facilitates dilation of the os and the act of aspiration aids in passing the semen into the uterus. Many more mares conceive when the semen is discharged into the uterus than do when the discharge terminates in the anterior part of the vagina and with good reason for these results. In the first place if the ejaculation is directly into the uterus the spermatozoa have a less distance to travel and they are usually in the most healthy part of the genital tract.

The spermatozoa while in the uterus are not exposed to the same destructive elements they would be for the reason that the uterus is a fairly well sealed cavity, being more remote from infection than the more exposed vagina.

While virile, active spermatozoa will live under favorable conditions for a great number of days, yet in practicing artificial insemination we must remember that, as a rule, these

male cells are promptly destroyed by acids, various bacteria, exposure to bright sunlight, lowered temperature, etc.

The successful breeder carefully studies normal conditions and then proceeds to imitate them just as closely as possible. Spermatoza may be kept active under artificial conditions for from eight to ten days, and under the favorable environment of a healthy uterus it is not unreasonable to think they will live much longer. Sufficient experiments and demonstrations have been practiced to a point where there can be no doubt that vigorous spermatozoa may live in a healthy uterus from one heat period to another.

This fact should help to explain the long periods of gestation that have come under the observation of every breeder.

Of the many thousand spermatozoa that may be ejaculated at a single service only one is used in the final act of conception. It resolves itself into a race of the strong and there apparently exists a cell attraction, that does not abate until an active spermatozoa has come in contact with and penetrated the female cell. When this occurs the external layer of the cell promptly assumes a more resting nature and the entrance of more cells is prevented and the positive attraction becomes negative.

This is the act of fecundation and a new being begins development. The tail of the male cell becomes lost in the fusion and the complicated process of cell division mark the changes from this time on. The divisions of the cell bodies are simple at first, but gradually there becomes arranged three chief layers from which all the separate parts of the body are formed. As the process of development goes on a division of the body's labors takes place. Certain organs are formed whose office it is to perform certain definite functions. For instance, the heart is concerned in propelling the blood throughout the system, the lungs in furnishing the system the necessary oxygen, the kidneys in excreting waste, the skin as a protective covering, and so on.

Early in the history of all this the impregnated ovum is propelled through the uterine duct and becomes attached to the mucous lining of the cornua or body of the uterus, where it reposes during the process of development until it reaches a point where it may be safely expelled into the world to grow into one of its kind.

While in utero the new life is sustained for a time by nutrition furnished by its own cell and the secretions from the walls of the uterus, but nature shortly begins an investment with membranes which makes the problem of nutrition more certain and permanent, and these membranes are attached to the uterine wall which facilitates an interchange of nutrition including oxygen, and gives opportunity for an outlet for the waste material developed by the growing foetus.

It is difficult for one to appreciate the marvelous function of the uterus. It has certain functions to perform and in order to do those functions properly must be in a healthy state. Not only must it arrest the outward moving fecundated ovum but after securing it to its own wall it must aid in nutrition and build up around the embryo membranes that will contribute to its well being.

This work is physiologically shaken somewhat for a time by those subsequent periods that marked regular estrum, but in the course of time this influence all subsides.

The third and sixth week, however, are critical periods inasmuch as the attachment is so frail that the young embryo may become easily dislodged and an early abortion occur.

Having read carefully through this lesson, one or more times, the student should now ask himself the following questions and find the answers thereto from the text and the accompanying drawings:

1. What is estrum?
2. Does it ever appear after conception?
3. What bearing has this on the carrying of the newly formed foetus over the three and six weeks periods?
4. What caution do these physiological facts suggest in connection with the teasing of mares when brought back to the stallion for retrial?
5. Is the ovum released before or after estrum?
6. Does the fertilization of the female cell take place during heat?
7. Where does the fertilization take place?
8. In what cases is it necessary to introduce semen into the uterus of the mare after the heat period has closed?
9. What difficulties are avoided by introducing semen in a capsule directly into the uterus?
10. Why is the ovum likely to be fertilized by one of the strongest of the male cells.
11. Why is the depositing of semen in the vagina, as occurs sometimes in natural service, unfavorable to fertilization?
12. Describe the processes which follow the meeting of the male and female cell?

Stallion Service Record Book for Two Hundred Mares—The latest and best on the market, as cheap as the cheapest. It is a handy pocket size, with 224 pages of strong bond paper and a waterproof cover. It has a calendar, a gestation table and an index of twenty pages so that each mare can be found easily. Each mare has an entire page. This book can be used for several sires without carrying more than one at a time. Notice how easily it is to record the breeding of a mare and give the details. This record book is the result of the opinions of many breeders. It has no worthless advertisements in it. If you are not satisfied with it, return it and get your money, which will be cheerfully and promptly refunded to you. Price 50c each, postage prepaid. Published by

THE AMERICAN BREEDER
225 WEST 12TH STREET
KANSAS CITY -:- MISSOURI

FROM AN ENGLISH SUBSCRIBER.

Dear Mr. Graham:—Your paper is excellent. I am looking forward to the articles about the horse. As you know, I am one of those who would like to come out for a course in the breeding school, but cannot manage to do so. I hope when you think of coming over to England you will let me know. I hope to procure a farm in this district soon. Your capsule system interests me much. Horse breeding is in a very unsatisfactory state in England. By your system the high priced stallion would be brought within the power of the little man. I should like to further it here. I think if I could get hold of Mr. J. W. Ranerman, something might be done. He is a real good man. I should like for you to show me how to examine mares and be able to know why one won't breed. Farmers here sit still and never seek the reason why. Our Shire stallions are over pampered and won't get the foals they should.

I should be obliged to you if you will put me in connection with some of your agricultural implement firms. We are far behind you here. I mean some day to go in for those patent self-lifting gates. I heard a great account of them from a man here. Wire fencing and everything is of interest. With kindest regards. You remember our meeting at the Royal at Norwich. I've never ceased talking to people about your paper.—George Eyve, Warren House, Brandsby, Essingwold, York, England.

IMPORTANT SADDLE AND HARNESS HORSE DEALS.

The record price of $10,000 is said to have been paid recently for the famous saddle bred show stallion, My Major Dare. This horse was a part of an important purchase made by R. A. Long of Kansas City, for his farm near Grandview, Mo. The purchase included the entire stable of Paul Brown of Paris, Mo.; the prize winning gelding, Gingerbread Man, being the next most noted animal it contained. Mr. Brown had only recently bought My Major Dare in Kentucky, paying $6,500 for him.

Two express cars loaded with race horses, trotters and pacers, passed through Kansas City recently on their way to Australia. These horses had been bought by an Australian sportsman from W. B. Taylor of Sedalia, Mo., and were being shipped to San Francisco by rail and from there to Melbourne, Australia, by steamship. The shipment included nearly a dozen campaigners with marks ranging from 2:11¼ up to 2:28½.

HOW TO TIE KNOTS.

Many an accident with live stock, and much annoyance and work, have resulted from lack of knowledge in the tying of knots. In the old countries, and in rare cases in this country, boys on farms are early taught how to tie and splice rope. But there are many people who daily need this knowledge but have had no chance to gain it excepting through unfortunate experience. All such will be glad to know that a bulletin has been printed by the Minnesota Agricultural College on tying and splicing rope. This is a very handy bulletin, illustrated with photographs and drawings. The author is Prof. J. M. Drew of the college. It may be had by asking for Extension Bulletin No. 33, from the Minnesota College of Agriculture, University Farm, St. Paul, Minn.

NEW NEVADA STALLION LAW.

To the American Breeder:—Last winter I noticed a bill you had drawn for the collection of service fees. I gave it to one of our representatives at the legislature, and here is a copy of the bill that was passed:

An act to provide for lien on mare and offspring for service of stallion, and to make it a misdemeanor to sell such mare or offspring without the written consent of the party holding the lien.

Section 1. The owner or keeper of any stallion may advertise the terms upon which he will let such stallion to service, by publication thereof in some newspaper of the county where such stallion is kept, for sixty days during the season of each year, or by printed handbills conspicuously posted during such period, in four or more public places in said county, including the place where such stallion is kept; and the publication or posting, as aforesaid, of the terms of such service shall impart notice thereof to the owner of any mare served by such stallion during any season; and in all actions and controversies in respect to the foal, the owner of such mare so served shall be deemed to have accepted and assented to said terms when so advertised and published or posted as provided herein.

Sec. 2. When the said terms of such service by any stallion, published or posted as provided in section 1 of this act, shall provide that the mare and foal will be held for the money due for the service of such stallion, then in that event the owner or keeper of such stallion shall have a lien for such sum on the mare from the time of service and on the offspring of the mare served, for the period of one year after the birth of such foal, which said lien shall be preferred to any prior lien, encumbrance or mortgage whatever; and the publication or posting, as aforesaid, of the terms of such service shall be deemed notice to any third party of the existence of such lien.

Sec. 3. Any person who shall sell convey or dispose of any animal upon which there exists a lien, as created in section 2 of this act, without the written consent of the party holding such lien, and without informing the person to whom the same is sold or conveyed that said lien exists, or who shall injure or destroy such animal, or aid or abet the same, for the purpose of defrauding the lienor, or who shall remove or conceal, or aid or abet in removing or concealing such animal, with intent to hinder, delay or defraud such lienor, shall be deemed guilty of a misdemeanor.

It seems to be a very good law, but does not give any protection to the owners of jacks, but I suppose that a jack would be termed a stallion.—Dudley Wilson, Lander County, Nev.

PERMANENT BREEDING DISTRICT

Those who expect to have a profitable district in which to do business must spend some time in educating the residents. Practically every community has a lot of "fogy" ideas that must be eliminated. Knowledge from a reliable source must be used in driving out "beliefs" and practices which have no foundation in fact. There is very little excuse for having many "fogy" notions in a community, where there are intelligent breeders interested in improved conditions.

A little time spent soliciting subscriptions for the American Breeder is a cheap and most effective way. The intelligent men will be very glad to post up on these subjects, because they want to raise good horses that will be profitable to them. They want to make money. These are the individuals that will argue from the right standpoint if given a chance. A reasonable number of intelligent men, well supplied with information, can talk to those who still argue in favor of old "fogy" notions.

The special subscription offer for clubs of five or more at 50 cents each, which was announced in the last issue, could be made use of to a good advantage in any community. The way to get these subscriptions is to simply ask the prospect for his subscription; simply state to him that you want him to read it and if he is not satisfied that you will give him back his money. Show him your copy of the paper and simply state that you would not take a dollar for it if you could not get another. This shows on the face of it that you believe what you are preaching. It is not necessary to have a lot of sample copies to hand out. That has been tried with all kinds of publications. An individual will take a sample copy and state that he will look it over and let you know at a later date. Many a good move fails in just this way.

We believe that practically every breeder has enough prestige among his customers and friends to get hundreds of subscriptions if he cares to. Every breeder of live stock could well afford to spend 50 cents to get the American Breeder. A very good introduction is to ask the prospect to look at the 49 different photographs on the front page of this paper. This will be a very good introduction. If every breeder in the country would get busy and send in their subscriptions they would have a better locality in which to do business.

All those who sends in one club of five can send in any number of additional subscriptions up until July 1, for 50 cents each. It will not be necessary to get a club of five or more in each case, just the first club. A little effort will convince any breeder that it is very easy to get a large number of subscriptions in his locality if he cares to.

OUR NEW COVER PAGE.

Cuts representing typical specimens of 48 different breeds of live stock make up the front cover page design for this issue. For one breed of cattle, the oldest and most numerous recorded breed on this continent, we have two illustrations to represent the beef and dairy types, making 49 cuts in the design. These illustrations represent nearly all the registered breeds of live stock which are to be found to any extent in this country. In the case of sheep we had only space to show the leading types—one breed of long wools, one breed of fine wools and two of the more numerous classes of medium wools. The Dorset Horns are enough different in type also to be pictured separately, although they, too, are classed as medium or short wools. Some breeds of horses and cattle well known in Europe, are purposely omitted, since they have not yet entered into the animal husbandry of this country. We show also only those breeds of hogs which have found recognition among American stockmen. It has been very difficult, using photographs of all sizes and from all parts of the country, to make the cuts so that they show the animals of a kind in the right proportion as to size. The hog and sheep cuts (particularly the hogs) have purposely been made too large as compared with the cattle and horses, in order to secure more distinctness. Every illustration came originally from a life photograph of a prize winning animal, made without any retouching.

GUARDING AGAINST INFECTIOUS DISEASES.

Every breeder would do well to arrange some kind of a convenient hitch-rack between the gate leading to the barn, and the barn, so that all horses would be tied at the hitch-rack for inspection. The proprietor would do well to examine this stock before admitting them to other enclosures. It must be remembered that practically every farm in that vicinity will be represented at the breeding barn some time during the breeding season. If there should be any infectious disease in that community it might be spread at this place. Not only that, but there is considerable money invested in breeding stock that should be protected. If the hitch-rack, located as it is, does not prevent trespassers, a temporary fence might be erected. The owners of these establishments must use every precaution as there are many careless people who patronize such places. There are some, also, who do not believe that diseases are transmitted from one animal to the other from contact. But it is a fact that a horse having some disease may leave enough germs on the hitch-rack so that the next animal might be infected. If this hitch-rack is in the sun the sun will destroy the germs, as a rule. In fact, the sun is one of the best germ destroyers known. It is not expensive to make an arrangement of this kind and it will be very profitable for the average breeder.

Another advantage in having a quarantine arrangement, is that otherwise many breeders bring their horses right into the barn, or close to the stallion or jack, causing them to be very uneasy. The more quiet these animals can be kept in this respect the better the results obtained from them.

READING AND THINKING.

One of our readers has paid us a visit for the purpose of asking several important questions. He has been a subscriber to the American Breeder for three years. He has spent considerable money and time to come to Kansas City to get these questions answered. Each and every one of the questions he asked have been thoroughly discussed since January 1, 1913. When asked if he had read the American Breeder he stated that he had read every article in every issue for several years. Evidently he has not been a good reader.

The difficulty with this party is that his mind is not on the subjects that he is trying to absorb. He is a large farmer and has much other stock. In fact, he is a business man, having his mind occupied with various important things. He evidently has done like many others do; when an important article is prepared they look at it and lay it aside with the expectation of reading it thoroughly at some future time, but forget it.

It is not the great number of things that one hears about that gives one knowledge, but the mastery of a particular subject when it is presented. The best results are gained in this way.

Since the April 5 issue has been printed we have received about 300 inquiries concerning barren mares. Nearly every one of these questions was answered in that number. We do not wish to discourage any one from asking questions, but frequently a reader can save considerable time by reading these articles over a time or two. We realize that in the spring when the sun shines brightly after several months of winter, one is very anxious to accomplish something and does not take enough time to read and study this subject.

KEEPING YOUR SIGN OUT.

We have never urged advertisers to keep their ads. going, as much, perhaps, as we should. Some of our advertisers have only two or three animals to sell in the course of a year, so that a short time ad. is plainly all they need. But there are many breeders who have stock for sale at all times—enough so it must certainly be to their advantage to keep an advertisement going the year round in some good paper like the American Breeder. We are reminded to call attention to this fact by a letter just received in which a regular customer says he was surprised at the small cost of running an ad. in this paper by the year. It is a fact that the American Breeder is one of the most economical advertising mediums a stockman can use—or any one, for that matter—as shown by the letters we have published from advertisers of all classes.

But the point we make here is that a breeder with a stud of horses, or a herd of cattle or hogs, or a flock of sheep large enough so that he always has something good to show, and price, to visitors will find it pays him to keep his announcement in one good medium all the time. An inch advertisement in the American Breeder costs only $44 by the year, with a discount for advance payment. This is 25 to 30 per cent less than the rate on an ad. which runs only a month. The saving in rate, however, is of small importance compared with the advantage of keeping your sign out all the time. Other things being equal, the custom reached by a paper will be divided among its advertisers, but it is a fact of common experience that the regular advertisers get more than their proportion of custom in a busy time for the simple reason that the public prefers to trade where it feels best acquainted. In the more quiet times when many advertisements drop out of the papers the regular advertisers get all the business there is going.

HORSES IMPORTED FOR BREEDING PURPOSES.

Since the Bureau of Animal Industry withdrew its recognition from all American live stock record associations on January 1, 1911, a record of all animals imported to this country for breeding purposes has been kept. Several new rulings have gone into effect since that time. The animal in question must correspond exactly with the pedigree in every respect or the animal is not admitted to this country free of duty. In this connection pedigrees issued by certain foreign associations are recognized. A bulletin containing all of the horses imported for breeding purposes during the year of 1912, was issued April 17. The bulletin gives the name of the animal, registry number, importer, port of entry and date of arrival. Each animal has a department number so that in case of correspondence the number given to the animal by the Bureau of Animal Industry can be referred to, which will make it more easy to find a given animal. In this bulletin the animal's numbers in parentheses ( ) are the registration numbers of stud books across the seas. The numbers printed between equal signs = are the registration numbers of the Canadian National Records. These animals are recognized by the Bureau of Animal Industry. All of their certificates are stamped and approved by the United States Government. This bulletin may be had by writing to the Bureau of Animal Industry, Washington, D. C. It is entitled, "Horses, 1912." The breeds, and number of each imported, are given below.

Breed.	Stallions.	Mares.	Total.
Belgian Draft	609	347	956
Clydesdale	33	57	90
French Draft	9	...	9
Hackney	14	12	26
Percheron	1,104	859	1,963
Shetland Pony	4	27	31
Shire	156	91	247
Standardbred	1	2	3
Suffolk	10	15	25
Thoroughbred	4	8	12
Welsh Pony	13	92	105
Total	1,957	1,510	3,467

Of the above, 10 of the Belgians, 3 of the Percherons, 1 of the Shires, 1 of the Thoroughbreds and 1 of the Welsh Ponies were imported in 1911.

"YOU ARE RIGHT."

To the American Breeder:—I want to thank you for the mention of my new horse, Mon Gros, which I bought of J. Crouch & Son. You are right. I never would have bought such a high priced horse if I had not known I could breed with capsules. I had two Percherons and I changed one for a Belgian because I thought one of a kind was enough where you can breed with capsules, and I think the day is coming when the people will demand the best. He cost me about $4,500.

I would advise men that are going to breed with the capsule to not breed any more shy breeding mares with capsules the first year; it will hurt the capsule system. I got several of them in foal, but several I did not, and it hurts your per cent. People are asking me now what per cent of foals I got with the capsules. I breed both naturally and with capsules, but do not want to commence the capsules until the first of May if I can keep from it. I want the weather to get warm. Some have been wanting to breed with the capsule, but I am put-

ting them off until the weather gets warmer.—M. A. McMahan, Jersey County, Ill.

SCIENTIFIC BREEDING SCHOOL.

We were in hopes that the American Breeder school, printed in this paper, would largely take the place of the Graham Scientific Breeding School, as the American Breeder has grown to such proportions that it takes most of the editor's time. But the management of that school is receiving letters asking when the next term of the Scientific Horse Breeding School will be held. These letters state that they want some practical work where they can see these demonstrations; they want to dissect mares and see barren mares so that they can distinguish a good one from a bad one.

There will only be two terms of the Graham Scientific Breeding School this year, one of them will be about the middle of August and the other one in December; the exact dates will be given later.

It is a pleasure to meet these intelligent breeders who attend this school, even though it adds an enormous amount of work. Those who have attended this institution have made history, as much of the work given is absolutely new to the world. These men, as a rule, have been very successful. There have been some failures, of course; this must be expected from any institution, but the fact that such a large per cent of the members have been successful is evidence that these failures are not the fault of the institution. There are two things that those who attend this school are usually proud of, and that is that the instruction is of a high class both scientifically and morally. It offers an opportunity for a breeder to be an expert. If he is not satisfied with the knowledge received he may return at as many future terms as he cares to without additional tuition.

The scope of the school will be advanced in coming terms, as the breeders will be taught how to detect diseased mares with a microscope. This is the only place in the world where this is taught. The average breeder will believe that this is beyond his capacity, but it is not. It is made so plain and simple that any breeder can learn it in one week if he will pay attention to the instruction. In fact, it is so simple that the average breeder is surprised. A part of this work has been given at the last few terms, but it will be made complete this year. The plan is to make this instruction so complete that the breeders can diagnose the exact breeding condition of all mares very quickly and easily.

The tuition fee will be $25 for a life membership. Any one attending this school who is not satisfied in every way can have his tuition fee refunded without any questions. This school has been attended by leading breeders all over the country and all have been satisfied.—Advertisement.

NAVEL ILL IN YOUNG ANIMALS.

To the American Breeder:—Navel ill, often called "joint-ill," or "foal lameness," is a disease of young animals, occurring soon after birth, and usually terminating in death.

It is a form of blood poison entering through the unhealed navel. The first symptoms of the disease noted are swollen joints, fever, lameness, and later, abscesses and diarrhea, resulting in death.

Colts and calves are the principal victims, although all young may become affected.

The treatment is principally prevention. Do not turn the mare about to foal in an old filthy box stall, or in a stall where the disease has occurred. Remember it is highly contagious. Disinfect the barn thoroughly. In warm weather, turn pregnant mares or cows outdoors. Paint the navel cord with a weak solution of tincture of iodine or very weak carbolic acid—five drops of carbolic acid to half pint of water. Keep the young animal clean and examine the navel cord to see if it is drying up normally.—E. T. Baker, Veterinarian Idaho Experiment Station.

FAULTY CONFORMATION VS. BLEMISHES.

To the American Breeder:—Having never owned a blemished stallion is evidence I am not in favor of that brand of stock horses. On the other hand, having owned and used stallions with faulty conformation, I am emphatic in denouncing the latter class from expensive experience.

The fact is always at hand that the individual himself transmits the blemishes or faulty conformation and not necessarily the entire class. If the entire class of hereditarial blemished stallions is destined for the discard by the "stallion boards," the other class should be coupled with them. Of course this will never come to pass, but nevertheless breeders should be cautious of the faulty made ones.

In illustrating this point I'll take a stallion with two large bone spavins and a stallion with faulty conformation, which in this case was poorly set stifles. We will follow these horses several generations of descendants covering a period of 15 years.

The stallion with the spavins was a rugged, handsome registered Clydesdale, owned by a rancher from Missouri. He had probably 60 mares of various types and distinguished chiefly as being straight horse. The Missourian's method of breeding was simple. He bred all the fillies back to their sire; sold the original mares and when the stallion was 19 years old, sold and replaced him with a son from a granddaughter. Now during this entire period I have diligently been on the outlook for spavins among these horses, but never a blemish. Horse buyers have repeatedly maintained that this bunch of horses has never, in this territory, been equaled (considering their number) for class, bone and uniformity in size and color. One year a carload of these horses topped the Omaha market.

Now for my faulty sound horse. He was a first class stallion every way excepting his stifles. At a distance this horse appeared to have only one leg so snugly did his hind legs fit together. He never sired a colt that did not have his weakness. I kept him as he was a high priced and weighty horse and expected to overcome this defect with good stallions following. After three outcrosses with first class stallions free from this defect, the offspring still held their heritage and I never did correct it, but shipped every females that traced to the original horse.

The results were, after starting with a high priced stallion and expensive mares, I had to make a new beginning and the Missourian with a cheap start had a profitable and satisfactory ending. Each stallion had a defect but only one transmitted.—L. R. Dillon, Perkins County, South Dakota.

SPEAKS FOR THE BELGIANS.

To the American Breeder:—As your Utah subscriber seems to be unsettled as to the better breed to raise for the city market, I will say that, in my opinion, the Belgians are the better for several reasons.

A grade Belgian can be made to weigh at age of three years, coming four years, from 1,800 to 2,000 without much difficulty. His vigorous constitution makes him less subject to diseases than any other breed; makes his an easy feeder and keeper; a good shipper and a horse that will give satisfaction to the man that uses him. They are just as sound as any of the other breeds and have plenty of bone, style and action, and are good sellers.

Judging from observation, the other breed the Utah gentleman mentions, has good quality of bone but are slower maturers and not so easily kept, making them of greater expense to the producer.

In comparison with other breeds the Belgians have proven themselves superior to all breeds, having won championship over all draft breeds in the years 1878-79-80-81-84. Since that time they have competed only once; in 1900, at Paris, where it was won by a Belgian stallion and mare.—G. S. Perkins, Peoria County, Ill.

HORSE SALE AT MEXICO, MO.

One of the last important horse sales of the season was held at Mexico, Mo., April 17 to 19. In this sale about 75 head of saddle and light harness horses were sold, bringing a total of somewhere near $35,000. Prices were uniform throughout the sale; good enough and at the same time moderate enough to be satisfactory to both buyers and sellers.

Among the more important purchases we list the following:

Governor Major, gelding, bought by E. D. Billings, Chicago, Ill., for $700.

Champ Clark, bay gelding, same buyer, $450.

King Hamilton, black stallion, Richard Dillard, Shamrock, Mo., $605.

Nat Goodwin, bay gelding, C. D. Ragsdale, Shelbina, Mo., $500.

Sally McDonald, chestnut mare, John R. Thompson, Chicago, Ill., $800.

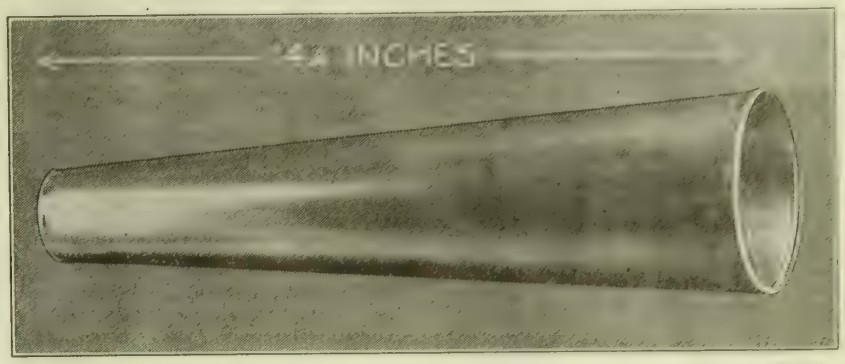
Jack O'Diamonds, chestnut gelding, James Houchin, Jefferson City, Mo., $450.

High Ball, bay gelding, C. R. Wells, Washington, Ia., $710.

Willie Green, trotting stallion, M. F. Brannon, Knoxville, Tenn., $450.

May Morning, bay mare, C. N. Arnett, Ames, Ia., $305.

AMERICAN BREEDER IN THE LEAD



To the American Breeder:—Have sold all the stock that I can spare. Will have more next year. The American Breeder is in the lead in finding buyers. Will try to give you a better ad. next time.—Isaac Lohman, Clinton County, Mo.

A STRONG SHIRE ARGUMENT.

The Trumans' Pioneer Stud Farm of Bushnell, Ill., has issued a little book, written by J. H. Truman, and entitled "The Sovereign Shire," that is doing a good service for every man in the business of breeding and selling English Shire horses. It is one of the best and most interesting booklets of this kind we have ever seen, and it is well worth the while of every one interested in Shires to write Mr. Truman for a copy of this book—which doubtless can be had for the asking.

GET A SPECULUM

if you want to know the condition of a mare's genital tract and whether or not it is diseased. A Speculum is also the only means of examining the cervix to make sure if a mare is in foal. Many an abortion has been caused which the use of the Speculum would have avoided.

This Speculum is made of good material, nickel plated, and with proper care will last a life-time. SENT POSTPAID FOR $3.00.

Horses and Sheep Strongest.

Increasing City Orders For Drafters Strengthen a Steady Market. All Meat Stock But Sheep Went Off Last of April, Cattle Recovering Partially.

A good healthy tone prevails in the horse and mule market. The one exception to the general encouraging news around the circuit was that St. Louis was a little top heavy on the mule side. But that condition has been righted and a good even tone prevails. The market is not rushed or boomed, nor yet is it by any means lifeless. There is just that persistent, even demand that takes liberal supplies without disturbing prices. Of course slight variations occur due to difference in personal judgment, but such a condition is present all the time, as standards and fancy in the horse market are less uniform than for any other class of live stock. The principal demand is for chunks, farm horses and drafters. The almost impossibility of buyers to get farm mares makes them a market factor of little consequence. However, their scarcity does not indicate lack of demand, but on the contrary shows their desirability. A good mare will sell from $150 up and the proper class with good color would bring above $300 easily. Farm horses are bringing from $75 up and nothing with much class is obtainable under $150. The drafter class is quoted at $150 up, and for something fancy, with a good advertising string attached would go as high as $400.

The most important feature reported from Eastern markets is that the city users of traffic power are beginning to increase their orders. There it is reported that firms that use two to twenty horses are filling orders, and some of them have not been in the market for over a year. The inference is that they have tried the motor truck and are now returning to the surer way of hauling. If this is the beginning of a general turning to horse power again the market is due for a period of prolonged activity. Farm horses are in general demand, made so by a fine opening season for farm work. In the past week general rains have fallen in all states from the Rockies east. The wheat crop is assured, with few exceptions, and corn planting is well along under favorable conditions. The first crop of alfalfa is assured, and grass in general is off to a good start. The favorableness of the season thus far is a bar to a possible course of liquidation.

Flood conditions in certain sections of the South have retarded demand for mules to some extent, but present indications are that such conditions will be adjusted later. Southern demand from now on will decrease, and in the hot months of July and August become dull, if trade keeps to its precedent of former years. The June harvest field heretofore has been a source of considerable outlet for big mules, and this year will be no exception. Fairly active markets are expected for the next two weeks.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs. up	$250@300
Drafters, fair to good	175@245
Chunks, fair to choice	135@175
Chunks, fair to good	90@130
Expressers and light draft	60@120
Plain workers	50@ 90
Southerns, good	135@165
Southerns, plain to fair	85@130
Plugs	15@ 45
Mules—	
13 to 14 hands	$ 85@135
14 to 15½ hands	125@165
15½ to 16 hands	160@200
16 to 16½ hands	190@285

Slump in Cattle Prices.

Unexpected heavy receipts on the closing days of the last month sent cattle prices into new low levels for the season. Heavy steers in the past two weeks declined 35 to 50 cents, and the light weight grades only 15 to 25 cents. This decline, however, in connection with the weakness of the preceding ten days has carried values below this period a year ago. At present the market is but little stronger than Tuesday, the lowest time this week, and is the direct opposite of a year ago. In May last year prices started up and the advance was practically unchecked until in November, when prime beeves were selling at better than $10. Now the best steers are quoted at $8.50 to $8.65 at river markets and up to $8.75 in Chicago. The heavy receipts this past week can be traced to the desire of feeders to get rid of cattle in order that the rush of farm work will be undisturbed later. The supply carries an unusually large amount of beef and for spring offerings the quality is unusually good. The liberal receipts of the past ten days have put killers on easy street and now they are in a position to tide over a period of moderate supplies without having to boost prices. However, the movement of the past two weeks has reduced feed lot supplies and other cattle on dry feed have been turned to grass on account of the slump in prices. Prime finished beeves for the past two months have shown a comparatively small margin over those of lesser quality, and if any class is in for a rise thick fleshed steers will get the benefit. Prime steers are quoted at $8.50 to $8.65, good to choice $8 to $8.45, common to fair $7.25 to $7.90. On the quarantine side meal fed steers brought $7 to $8, and some steers fed cotton seed cake on grass brought $6 to $7.40. The light weight grades, with some finish have sold on an equality with the heavier kinds, yearlings bringing up to $8.60, within the past two days. Lines of fed cattle are being closed out rapidly, but an early movement of meal and caked steers will fill in the gap between this and the movement of straight grassers.

Quotations from the various grades of killing steers are as follows:

Prime corn fat steers	$8.60@8.75
Good to choice steers	8.15@8.55
Fair to good steers	7.60@8.10
Common to fair steers	7.35@7.50
Meal fed, choice	7.40@8.00
Meal fed, common to fair	6.25@7.35

Butcher Cattle Moderately Lower.

Butcher cattle lost only 10 to 20 cents in prices in the past two weeks. While killers were fighting shy of the fat steers they were scrambling to get the tidy weight heifers and steers and heifers mixed. All the decline came in the past three days. Heavy cows were quoted off 25 cents, but bulls and calves remained firm. Butcher cattle at present quotations are relatively higher than steers, but scarcity together with the broad general demand is keeping values up.

The following quotations are for the various grades of butcher stuff:

Cows—	
Choice	$7.00@7.50
Fair to good	5.75@7.00
Common to fair	5.40@6.75
Canners	4.00@4.50
Heifers—	
Choice fed	7.90@8.35
Good to choice	7.25@7.75
Plain to fair	6.25@7.20
Common	5.25@6.20
Veal calves	4.50@10.00
Bulls	4.50@7.50

Less Demand for Thin Cattle.

Since the fat cattle market has shown a slump demand for stockers and feeders has slackened and prices fell back 25 to 35 cents. Considering the high levels that have obtained this decline is of little consequence. The cattle too are beginning to show grass sap and in a few weeks prices will have to be reduced to offset weight increases. However, stock feeding and feeding cattle are scarce and no large supply is in sight for the summer months. Prices will continue to show a big margin over the past few years.

The following quotations are for stock and feeding cattle:

Selected feeders	$ 7.95@8.30
Good to choice feeders	7.45@7.95
Plain to fair feeders	6.90@7.20
Good to choice stockers	7.35@7.75
Selected stockers	7.75@8.15
Plain to fair stockers	6.75@7.70
Stock calves	6.25@8.00
Stock cows	4.25@6.00
Stock heifers	4.75@6.50
Milch cows	35.00@90.00

Big Decline for Hogs.

Hog prices in the past ten days fell back 85 to 90 cents, reaching the lowest level of the past three months on Tuesday. In the past two days moderate rallies occurred, but the market still showed much uncertainty. Receipts have been fairly liberal, but not large enough to cause such a decline. The downward movement in prices was rather arbitrary. Shippers have been out of the competition and this left packers in control. They lowered prices quickly. Receipts, however, continued to show a falling off compared with a year ago, and the May supply is expected to show further decreases. However, the spring pig crop is liberal, the shortage of sows considered, and if there is no renewal of the cholera scourge hogs next winter should be fairly plentiful. The summer and early winter run is scheduled to be light. Heavy hogs predominate the supply, and light weights command a premium over the other kinds. Shipping demand shows early summer weakness, and it is doubtful whether the decline in prices of the past two weeks will be regained at any time this summer.

The following table shows the range in hog prices in the last two weeks of April:

		Preceding Week.
Mon., Apr. 28	$8.25@8.60	$8.60@8.95
Tuesday	8.15@8.37½	8.60@8.85
Wednesday	8.20@8.45	8.40@8.70
Thursday	8.25@8.50	8.35@8.75
Friday	8.20@8.45	8.50@8.80
Saturday	8.20@8.35	8.40@8.70

The following quotations are for hogs on April 16:

Choice, 250@300 lbs	$8.30@8.35
Choice, 200@245 lbs	8.35@8.40
Medium weight	8.40@8.40
Light weight	8.35@8.45
Common to fair	8.15@8.35
Stags	7.00@8.30
Boars	4.00@5.50
Bulk of sales	8.25@8.40

Good Demand for Sheep.

While prices for other classes of live stock were lower the changes in sheep values were unimportant. Early this week prices were up 10 to 15 cents, but later the advance was lost. Demand continues good with receipts fairly liberal. The season shows some marked changes. Wooled grades are getting scarce and clipped grades predominate. Texas sheep are moving freely and Southern spring lambs are due as a supply factor. There is a broad demand for mutton and while that meat is relatively cheaper than either pork or beef there is no reason why demand should not continue broad. Wooled lambs are quoted at $8 to $8.75, yearlings $7 to $7.75, ewes $6.25 to $6.75, wethers $7 to $7.25, clipped sheep $6 to $6.75, and clipped Texans $6 to $6.35.

April Live Stock Receipts.

Receipts of live stock in April were nearer normal than in any previous month this year. The combined receipts at the five Western markets were 542,000 cattle, 1,294,200 hogs, and 830,000 sheep, showing a decrease of 9,800 cattle, 124,000 hogs and 2,000 sheep. Kansas City was the only market that showed increased supplies of cattle and hogs, but sheep showed a decrease. In the first four months this year combined receipts of cattle were 95,000 short of the same period last year. Hogs decreased 1,098,000, and sheep 360,000. May holds out prospects for light receipts. Farmers will be busy with crops, grass and other cheap feeds are available, and close marketing has been the program all season. Grass fat cattle will not be a factor before July.

WHITE'S SHORTHORNS

Good Cattle, Good Breeding, Good Dealing.

Have had a good season's business and stock is sold down to calves.

Inspection invited.

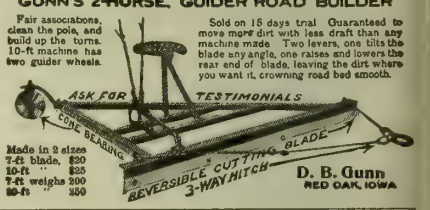
SCOTCH COLLIE PUPS

for sale. Sable and white; from fine working parents. Also the mother of the pups for sale. These will be sold cheap as I want to close them out. Can furnish pedigrees. **Amasa Roberts, Bentonsport, Iowa.**



GOT 'EM ALL READING AMERICAN BREEDER.

To the American Breeder:—As an agent for your paper, you will think me rather quiet, but writing is not in my line at all. Now I am located in a part of the country where ranches are the rule. I have every rancher for 12 miles around reading the American Breeder, and that is about my limit. I would like to have put on ten new names but I cannot find them just now. I may get a few before the season is out. I think the paper just right for the stock man. I used to get the ——— ———, but I find that this paper is all that is needed to keep me posted on live stock. The capsule system is all right. I tried a few and it works all right. Wishing your paper every success.—Robert R. Johnston, Dupuyer, Teton County, Montana.

AGENTS—$173 IN TWO WEEKS,

Made by Mr. Williams, Illinois, selling the Automatic Jack Combination 12 tools in one. Used by auto owners, teamsters, liveries, factories, mills, miners, farmers, etc. Easy sales, big profit. Exclusive county rights if you write QUICK. **Automatic Jack Company, Box O, Bloomfield, Ind.**

CAN VACCINATED HOGS TRANSMIT CHOLERA?

A test begun at the Kansas Agricultural College in April will show whether a hog vaccinated with anti-hog-cholera serum can transmit the disease to a susceptible animal—one that has not been vaccinated. When a hog is vaccinated by the "simultaneous" method it undergoes a light form of the disease. It hasn't been proved to the satisfaction of veterinarians that an animal in this condition is not capable of transmitting cholera.

The experiment will show, it is hoped, whether it is advisable to bring susceptible pigs on a farm and place them in a pen with animals that have received the simultaneous treatment. It should prove or disprove the assertion, sometimes made, that animals undergoing the effects of simultaneous vaccination should not be exhibited at fairs because of the danger to other animals. The question also of vaccinating, simultaneously, only a part of a herd doubtless will be settled by this test. Sixty or seventy hogs will be used in the experiment.—Kansas Industrialist.

INDIANA CATTLE FEEDERS' CONVENTION.

To the American Breeder:—The annual spring meeting of the Indiana Cattle Feeders' Association has been called by President Maurice Douglas to meet in Lafayette, Ind., at 10:30 a. m., Friday, May 23, 1913. A program of special interest to cattle feeders has been prepared. Prof. W. A. Cochel, formerly at Purdue, but now at Manhattan, Kas., will give the principal address. The experimental cattle now on feed at Purdue Experiment Station will be ready for market at the time the convention is held. These cattle have been fed on different rations since last November. A complete record of the cost of cattle, feed consumed, cost of grain, value of cattle, and profit or loss per head in the different lots, will be presented to the members of the convention. Every person interested in cattle feeding is invited to attend. Information can be secured from the secretary of the Experiment Station at Lafayette, Ind.—F. G. King, Secretary Indiana Cattle Feeders' Association.

KAFIR SILAGE MADE MOST PROFITABLE GAINS.

A calf feeding test, recently completed at the Kansas agricultural experiment station, demonstrated the value of kafir corn silage—at least under the conditions, and prices of various feeds, experienced in this particular case. As outlined in a previous issue of the American Breeder, the test was made with 50 very uniform high grade beef bred calves, all bought in a bunch from the herd of C. A. Johnson of Russell county, Kas., and fed until they were about 12 months old.

The 50 head were divided into five lots of as uniform quality as possible, and these lots were fed 100 days at the college at Manhattan. Mr. Johnson was paid $7,80 per hundred for the calves, and the initial cost of each lot (at the weights shown in the table) was figured on that basis. In estimating the cost of making the gains, labor as well as feed is included, and the various feeds are charged at the purchase prices, or the current prices for that locality, and time, as follows:

Corn silage, $3 per ton; kafir silage, $2.66; sorghum silage, $2.66; alfalfa hay, $10; corn stover, $3; cotton seed meal, $30 per ton; shelled corn, 50 cents per bushel.

In the case of Lot V (as noted in the table) the weight of corn stover given does not represent the amount consumed, as nearly 3,000 pounds of this (corn stalks) was left uneaten and thrown out of the mangers.

This experiment was reported, and the calves exhibited, on May 2, to one of the best gatherings of cattle men ever seen in the state. President Waters of the college, and Professors Cochel, McCampbell and Vestal of the Animal Husbandry addressed the meeting. Dean Jardine of the school of agriculture, presided.

	Lot I—Fed Corn Silage, Cottonseed Meal.	Lot II—Fed Kafir Silage, Cottonseed Meal.	Lot III—Fed Sweet Sorghum Silage, Cottonseed Meal.	Lot IV—Fed Corn Silage, Alfalfa Hay.	Lot V—Fed Corn Stover, Shelled Corn, Alfalfa Hay.
Initial weight (pounds)	4,172	4,124	4,281	4,248	4,294
Initial cost at $7.80	$325.40	$321.65	$333.90	$331.35	$334.95
Feed consumed (pounds):					
Corn silage	27,431	.....	.....	18,533	.....

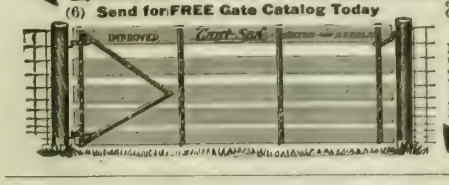
Profit, per lot	47.05	60.46	51.03	48.04	49.34

*Note:—Of the 8,710 pounds of corn stover fed only 5,792 pounds were consumed, the balance (cornstalks) being the waste—excepting for its bedding value—from that method of feeding.

AN IDAHO IRRIGATED FARM.

To the American Breeder:—I own two stallions and one jack and an 80-acre irrigated farm, one and one-fourth miles from town. I raise timothy and clover hay which I cut twice a year, and average about three and one-half to four tons per acre. Alfalfa hay, which I cut three times a year, about eight to ten tons per acre. I generally raise some grain; wheat as high as 52 bushels per acre; oats as high as 87 bushels per acre. I keep three brood mares to do the work and raise colts. I live on the R. F. D. and have a telephone and am going to have electric light before fall.—Frank N. Taylor, Ada County, Idaho.

"Can't-Sag" Gates Cost Less Last 5 Times as Long



I'll save you big money on your farm gates. My new catalog quotes such astonishingly low prices on CAN'T-SAG GATES AND GATE STEELS that you simply can't afford to build another clumsy, all wood gate. My FREIGHT PAID PRICES are half what others charge for short-lived steel, wire and gas pipe gates.

30 Days' Free Trial—5 Year Guarantee

I give 30 days free trial and a signed 5-year guarantee. Send for my big free Gate Catalog at once—see why Can't-Sag Gates outsell and outlast all others. Read what other farmers and customers say about them. When you get this book you can either select complete CAN'T-SAG GATES, Ready to hang, any height, any length—painted or unpainted or if you prefer you can order just the GATE FITTINGS which includes everything but the boards. With these you can build your own Gates in 20 minutes and SAVE BIG MONEY.

(6) **Send for FREE Gate Catalog Today**

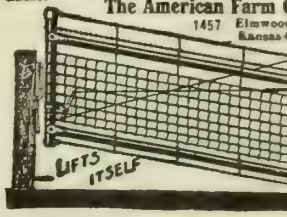
Note These Special Features

Each board double bolted between 4 pairs of ANGLE STEEL uprights and 6 TRIANGULAR TRUSS BRACES. Patent reinforced SELF-LOCKING HINGE. Gate swings easily both ways—always hangs square and plumb. Elevating Attachment (furnished at slight additional cost) permits gates to be raised over deep snow or allows small stock to pass under. Write for Free Catalog and FREIGHT PREPAID OFFER TODAY. Address

A V Rowe, Pres. Rowe Mfg. Co. 616 Adams St. Galesburg, Ill.

MONEY SAVING GATE BOOK FREE

I want every reader of this paper to have and read, my Money Saving Gate Book. You can have one copy free if you will write me at once. This booklet tells you all about my



American Self-Lifting Galvanized Steel Gate

The only gate made with frame and couplings of 2-inch high carbon drawn steel galvanized tubing, equipped with an Automatic Equalizer, which allows the gate to Lift Itself and swing clear over uneven ground or snow, and a Ratchet Stretcher System which insures a tight, rigid gate forever. REMEMBER: This is the gate sold on a Three Years Guarantee. The gate that must be exactly as represented or you get your money back by simply returning it to your dealer. Write me today for my FREE gate book and nearest dealer's name.

AN INNING FOR CATTLEMEN.

To the American Breeder:—Cattle breeders who went through the discouraging experiences and low prices of twenty years ago had some cause to doubt the prophecy of better times. It required some faith to believe and no little courage to act on that belief. But those who had the faith and ability to hold on are now enjoying a well-deserved reward.

During recent years men raising beef cattle have come into their own. For some time prices have brought encouragement, but the last year has brought handsome profits to all classes, whether ranchmen, breeders or feeders. The writer has been connected with the beef cattle industry for more than 40 years, but he does not remember a time when the market papers were so full of letters of stockmen expressing satisfaction with prices received as they have been during the months of this year. Without exception these reports show handsome profits and some of them reveal returns so large that they almost challenge belief. The most gratifying feature of this desirable condition is that it is not transient but is destined to remain some years. It is the universal belief of men closely connected with the live stock trade that the price of beef cattle will rule high until there is a considerable increase in the supply of cattle. Commission men at the market centers generally hold this opinion.

It required two or three years to convince the country that there was a shortage in cattle, but that fact is now generally admitted and many erratic and senseless measures have been offered to prevent the further reduction of cows and heifers by sale or slaughter. As a result of high values for beef cattle, there is such a strong demand for cows and heifers as a foundation for cattle breeding that the trade in pedigreed cattle will undoubtedly be greatly benefitted. Commission men at market centers are holding orders from the country for cows and heifers for breeding purposes.

The trade in pure-bred cattle is slow to respond to an enhancement in beef values, yet a commendable interest has been manifested in recent public sales and will be more noticeable in those of the future. When beef cattle were at moderate values and grain high, farmers asserted and no doubt believed they could not afford to raise cattle on their valuable lands, but the present price of beef with a prospect of cheaper corn has modified the problem. Aside from their value in maintaining the fertility of the land, it is not difficult to figure a profit on cattle raising on farms of the cornbelt. When good feeders sell at 6½ and 8 cents and fat yearlings bring from $80 to $120 each, their production ought to leave the farmer a margin; and as this industry is developed, the demand for pure-bred bulls will increase. As farmers cattle, Shorthorns are peculiarly adapted because of their dual capacity for beef and milk production. For restocking the farms with a profitable class of beef cattle, they will be found useful and desirable.—B. O. Cowan. Los Angeles County, Cal.

Capsule System Experiences

(Continued from page 4.)

Got some mares in foal that never raised a colt before, and one mare 13 years old that never had a colt before until this year, and the colts are just as good.—A. H. Biegert, Junction City, Kas."

"I find the one service-a-day-capsule-system economical—in that I get a larger percent of just as good colts as by the old way. Also with one horse and one jack can breed as many mares as I could with three horses and three jacks by the old way of breeding.—L. M. Laflen, Milo, Mo."

"It surely will pay any man standing a stallion or jack to prepare to use the capsule system. It will save him and the mare owners a great deal of time besides being more profitable for both him and the mare owners. There is no difference as to size and strength between capsule colts and colts got by natural service. Two of the best colts I have seen this spring are capsule colts. There is always a certain class of mares that is hard for a good serving stallion to make a service on; such mares will be more easily fertilized with capsules.—F. H. Taylor, Sedgwick, Kas."

"I have very good success with the capsule system. I have some colts and can't tell any difference in them from the ones got by natural service. I think the system is all right and it will pay anyone to learn it.—L. M. Tucks, Morrisville, Mo."

"In regard to the capsule system, I think it would be profitable for anyone standing a stallion or jack for public service. I have had very good success with the capsule system. I haven't attended the Scientific Breeding School, but I intend to this fall. I attribute my success to the American Breeder. As far as the colts are concerned, I can't see any difference at all.—F. B. Griswold, Agra, Okla."

"I have been using the capsule method of breeding for three years and find it a great help in breeding. Have fertilized mares that way that I could not any other way. I had one customer that would not let me breed his mare with the capsule so I had to breed her with natural service, but could not get her in foal; tried two years. Last spring he came back and I would not breed her any more only with the capsule, and he finally let me try once, and the first one got her in foal. I could tell you of many just such, but for want of space will close. Hurrah for the capsule system!—John W. Turner, Earlsboro, Okla."

"My experience with the capsule breeding has been very limited, but what little I have done convinces me that it is a success. I expect to use the system more extensively this year as it is a great saving to the horse, and there can be no doubt about the foals being just as good as from natural service.—C. F. Heffner, Clyde, O."

"I have a Morgan filly colt 1-year-old, from semen that I caught in my hand, put in a capsule and inserted in the mare's womb, that is as good as I ever saw. I have foaled four mares at a service with the capsule system and all brought living foals."—Nat W. Stewart, Plain Dealing, La.

"I think it profitable to prepare to use capsules, as taught by the American Breeder. The colts are just as good from capsule as from horse. No man can tell any difference in them; if there is any it is in favor of the capsule colts. A mare will not fertilize any more readily from a capsule than she will from a horse if he makes a complete service. The beauty of the capsule is, if handled according to directions in the American Breeder, that every service is a complete one while many services from the horse are not complete. I have poor faith in a mare fertilizing if the semen is left in the vagina. It is possible but not very probable."—D. L. Olson, Moroni, Utah.

"I can say that the capsule breeding is all right and the way to breed. The greatest difficulty is the ignorance of some men who try to make it their business to inform others that they are sure it will not work. There is no difference in the colts from a capsule than from natural service. I am breeding my registered mares with capsules when I can.—Arthur Colegrove, Girard, Kas.

"I used the capsules on five mares last season and got two colts from mares that had been bred regularly for three seasons before without result. This, I think, is pretty good for a beginner. I heartily indorse the capsule system."—James A. Barker, Conconully, Wash.

"I have used a Carlson extractor and capsules to some extent for three years with good success, though I have not had a fair chance, traveling so much territory, making seven stands, having no set hours and therefore having no conveniences and breeding all kinds of mares. I have settled at least 70 per cent. I have bred seventeen that were from 18 to 26 years old and which had been bred to horses and jacks every year without results, and I settled eleven of them and most of them the first service, so I can call that pretty fair."—B. H. Haskin, Coquille, Ore.

"Have had good results with capsules. Got two mares in foal bred out of season. A customer brought me two Shire mares 7 years old that he said would not breed. One of them settled to the first capsule; will foal May 20; the other one did not settle."—H. L. Salmon, Fowler, Kas.

"I think the capsule system is far the best if your directions are followed carefully, and I think the colts are just as good or better, and a man can more than double his income with the capsule system."—Charles Wright, Elsworth, N. D.

"I have used the capsule system of breeding and think it very profitable as you can breed so many more mares with one service of the horse. The colts are just as strong as from the natural service. I have gotten mares in foal with the capsule that would not settle with the natural service."—Chas. E. Parrish, Tulare, S. D.

"The man does not live who can tell capsule colts from those gotten by natural service. I have been able to get a number of so-called barren mares in foal (and they produced fine colts) by the capsule system. In fact, every mare that does not conceive to the first natural service is never bred again that way on my ranch, but from then on is booked as a mare to be capsuled only."—H. F. Fox, Sedan, Mont.

"I have used the Carlson extractor to some extent as an impregnator with reasonably fair success. I believe the Carlson extractor the best on the market. I have never employed the capsule method but believe it O. K. If I had the help and a little more experience along that line would employ that method of breeding altogether."—Julius Landwehr, Elmont, Mo.

"Capsule colts are just as good as other colts. I have three imported Percheron mares and I breed them with capsules. Also breed all of my grade mares with capsules. Mares that are too open can be bred with capsules and get 20 per cent more mares with foal than with natural service. Would rather breed my mares with capsules than any other way."—E. S. Jordan, Cheney, Wash.

"I have twenty imported mares in foal with the capsule this year to Buck 44521, one of the best breeding horses in the state, having won the championship at the Indiana state fair in 1911 for stallion and four colts. Buck is the horse I raised on the farm and has made the farm famous for good horses. I got sixteen out of eighteen in foal two years ago with capsules, something we have never been able to do with the natural service."—C. A. Randolph, Fowler, Ind.

"I saw an account of the Bayless-De Ro sale and wish to tell you that I purchased Modele, the horse that sold for $2,000. He is a great horse and is doing fine. He is making one service per day. I am using the capsule system, with which I have had the best of results for the past three years. If it was not for the capsule system I never could have owned Modele. He is standing at $20. I have bred as high as nine from one service."—Bert Taylor, Frederick, Ok.

"I have practiced capsule breeding since the Graham Scientific Breeding School first taught it, and now I would not think of doing business as a breeder without it. It now comes as a matter of course and has always proven a success. I now have capsule colts of all ages and my patrons never object to using them. Your inquirers can, by close attention to the teachings of the American Breeder, easily become proficient in using capsules, but if I had it to do over again I would attend a session of the Scientific Breeding School."—William Douglas, Rogersville, Mo.

"I consider the capsule breeding a great improvement over all other ways of breeding. There could not be any difference in the colts. I prefer the capsule breeding to all other ways. I believe that it is the best for both the mare owner and the man that owns the horse or jack."—J. H. Marshall, Lead Hill, Ark.

ONE SHARE OF STOCK
In The
PERCHERON SOCIETY OF AMERICA
For Sale; Price $7.00
WM. BACHMAN, NASHVILLE, KANS.

AT QUALITY STOCK FARM.
Full blooded registered stallions for sale from one to three years old. Sires and dams are imported price winners, the wide out, heavy boned kind, with plenty of quality. All will make ton horses or better. Also one imported Belgian stallion, weight 2080; six years old. A great breeder. Plenty of colts to show. **E. A. Silverthorn, Rossville, Clinton County, Ind.**

YOUNG PERCHERON STALLIONS For Sale
Some of them by the famour sirs
NICHOLAS 21997 (43394)
GEORGE HIRSCHMAN, Pierson, Ia.

PERCHERONS

Six Home-grown 3-year-old stallions, making 1900 to 2100 pound horses; the BIG TYPE. Richest dapple and steel grays and blacks. In attractive flesh ready for heavy service. May 5 I have these 3-year-olds besides yearlings and 2's and want to sell them. **Fred Chandler, Route 7, Chariton, Iowa.**

PERCHERONS TO BE DISPERSED.
A change in business makes it necessary for me to dispose of my Percherons. I have a 5 year old stallion by Tremont 33647, dam Suzanne 17340. I have some mares 3 years old and in foal. These mares combine size with quality and action; some weighing a ton. Mares sired by Nicholas 21997 (43394) and out of good mares. These horses are all of G. L. Carlson's breeding. It is worth your while to come and see this stock. **Dr. P. L. Benthack, Platte Center, Neb.**

IMPORTED AND HOME BRED STALLIONS AND MARES.
PERCHERONS, BELGIANS, SHIRES.
The best importation we ever made is now in our barns ready for inspection. The mares include some of the best fillies that came out of the Perche this year. See what we have before buying elsewhere. **Address Hart Bros., Osceola, Iowa.**

PERCHERON, BELGIAN AND COACH STALLIONS AND MARES, ALL AGES.
100 head to pick from; size, quality and breeding. We won over 50 first and second prizes and gold and silver medals at the Wisconsin State Fair. Grand Champion Belgian and Percheron stallion at head of stud. Prices and terms to suit. **Ives & Bellman, Delavan, Wis.**

CLYDESDALES
STALLIONS AND MARES FOR SALE.
Two of the stallions are coming 3-year-olds and extra good ones. They are sired by the International Prize Winner, Prince Henry. Come and see the values I am offering, or write **James Spear, Stanwood, Cedar Co., Ia.**

BARGAINS TO CLOSE OUT
Breeding Stock and Barns.
3 stallions: Two Percherons and one Belgian.
4 jacks: Two good big ones and two jack colts, also two big black jennets, one in foal to Black Cloud.
Will give anybody a good trade and will cut price in two to sell barns and all to one man.
W. E. Long, Roll, Blackford Co., Ind.

HERE THEY ARE
Just what you have been looking for, a pair of matched registered Percheron filly colts; steel gray; highly bred. **O. E. Fulghum, Richmond, Ind. National Road Stock Farm.**

CLYDESDALE HORSES
Stallions and mares of all ages for sale.
Also Shorthorn Cattle.
W. A. DeMerritt
Route 2, Plainfield, Ill.

Black Imported English Shire
stallion, Stuntney Domino, for sale. Weight about 1850; good breeder; sure foal getter; good bone and style; easily handled. I cannot use him in this neighborhood to do much good, as most of my customers want the Percheron and jack. **M. B. Cate, Dunlap, Grundy County, Mo.**

Draft and Coach Stallions
A fine bunch of Percheron, Belgian, French Draft and Coach stallions for sale; priced from $350 up. I have the big ton kind that are right. Come and see me, or write. **J. M. Nolan, Paola, Miami County, Kas.**

Four Clydesdales and one Percheron coming two years old; all big fellows with plenty of bone and quality. **John H. Chambers, Edinburg, Johnson County, Indiana.**

PERCHERONS.
Imported and home bred stallions and mares, from $200 to $900 each. **H. Redenius, Rushmore, Nobles County, Minn.**

REGISTERED DRAFT STALLIONS and mares for sale; mostly Percherons. Also road stallions, mares and colts. Prices to suit. **E. P. Hamilton & Sons, Garden Grove, Decatur County, Iowa. R. F. D. No. 2.** (Station, Leroy.)

QUESTIONS AND ANSWERS.

(Continued from page 6.)

service? Would it help any or would a little salt be of any benefit, or do any harm?—Missouri Subscriber.

REPLY—Do not use alum or salt, for both are injurious. If the mare is not diseased she may be bred with a capsule two days after she goes out of heat, with good results. If the flabby condition is caused from a disease, you will please refer to the articles on barren mares in the April 5th issue.

WHANG FOR MASTURBATION—Kindly describe in your paper just how the harness for masturbation is made and if it can be made in an ordinary harness shop.—Colorado Subscriber.

REPLY—Take a piece of whang leather three-eights of an inch wide; measure the penis when it is not erect; stitch the ends of the leather together making a ring; have the harness maker trim the edges so it will be perfectly smooth. Do not leave this ring in one position too long, as it might cause an irritation; move it forward and back.

TEMPERATURE OF SPERMATOZOA—Please inform me at how high a temperature spermatozoa will live.—North Dakota Subscriber.

REPLY—Do not get the temperature of the semen above 101 degrees if you expect any results with it in artificial breeding.

A TIMID JACK—Will you advise me what to do for a slow jack? He is three years old and a good one. Some mares he will serve in ten to 30 minutes and others he won't serve at all. Any information will be much appreciated. Now, is there anything to feed him?—Kansas Subscriber.

REPLY—Be careful that the mare does not show any signs of fighting. Do not feed him anything except good, clean jack feed. Be very careful with him and he will not be so particular after he is thoroughly broken.

STALLION WILL NOT MOUNT—What would be your advice for a stallion that will mount but not make entry? The horse is in good condition. —South Dakota Subscriber.

REPLY—Get a mare that is in good heat; turn your stallion loose with her. The feed should be diminished for at least 24 hours before such an operation, as he is liable to get warm and sickness might follow. We cannot give you much advice in a case of this kind for you have not given a very good description of your horse.

HINNIES—We have several good jennets that we would like to breed to stallion. What breed of stallion would you recommend to get the best results, or is there any sale for a cross of that kind? Will an animal of that kind be as big and as good as a mule from the same class of stock? What would you recommend, capsules, impregnator or natural service? Would a good, big, registered Hambletonian stallion and a good jennet get an animal suitable for farm work? Or what size animal would a person expect from such a cross?—Kansas Subscriber.

REPLY—A close made, heavy built stallion will probably give you the best results. The get of this union will be just as good as a mule, but not as large as a mule with the same blood lines. The capsule system, properly employed, should give you good results. All undersized jennets should be bred to stallions. A little mule will find a ready market. Small, inferior jacks have practically no value. All large jennets should be bred to the best jacks obtainable.

PASSES BLOOD—I have a mare 13 or 14 years old that until three years ago has raised a good mule colt. She always after being bred has regular monthly periods of passing blood whether she is in foal or not. I have been unable to settle her for the last three years. Could you suggest a remedy?—Missouri Subscriber.

REPLY—It will require a very careful personal examination in a case of this kind to find the exact cause of the hemorrhage. On account of her advanced years you can hardly expect to make her a breeder again. Should the hemorrhage continue annoying, have a qualified veterinarian examine her.

INFECTIOUS ABORTION—A great many mares have slunk their foals in this vicinity this winter, and we are at a loss to know what is the cause. We had a few days when the ground was covered with ice, but the mares that were in foal were in barns nearly all of this time. Our rough feed is in splendid condition and we can hardly attribute the cause to moldy roughage. Would be glad to have your opinion of the cause. What concerns me is this, would it be advisable to breed these mares again this spring? If not, what course of treatment would put them in condition so that they might safely be bred?—Indiana Subscriber.

REPLY—Your inquiry would indicate that infectious abortion is quite prevalent in your locality. Perhaps a careful investigation will disclose that there were a fewer number of such cases last year and that these mares were bred, as is usually the practice, resulting in infecting a number of the stallions in the community. One should never consider breeding an aborting mare to a stallion, no matter what the cause of the act. Whenever such a mare is fit to breed it should be done by the capsule method and thus do away with all danger of contaminating the stallion. Aborting mares need local attention in the way of disinfection at the hands of a skillful veterinarian who understands the use of medical agents on these parts These cases should be referred to such a man and should not be bred again until sound.

DOURINE—How can we tell if we should have a mare or a stallion come to our place that was affected with dourine? What are the symptoms?—Illinois Subscriber.

REPLY—Dourine is not easily recognized in its early stage and it is only when the disease advances to the point of causing depigmentation of the skin in the genital region with beginning paralysis can one be sure of a diagnosis. It is not likely that under the efficient federal control now exercised one need greatly fear meeting with the disease.

RHEUMATISM—Will you tell me what to do for my horse? About twice a year he becomes stiff and swells at the joints. Before he begins to complain I notice his urine becomes clear as spring water. This smells musty; last time from six to eight weeks. He does not seem to suffer and never refuses to eat. I have been told by doctors that it was his kidneys and about all that could be done was to give him something to move them. This horse is seven years old and has had these spells for four years.—Kansas Subscriber.

REPLY—We suspect your horse has occasional attacks of rheumatism. At such times give him three times a day a half ounce of salicylate of soda in his feed or dissolve in water when it may be administered with a syringe. Avoid exposure to inclement, changeable weather. Rub the joints affected briskly with alcohol three times a day.

ANNOYANCE FROM FLIES—For the past few seasons, but more especially the last season, our horses, both in pasture and in team, have been pestered to the limit by a small nose fly that looks similar to a bot fly, but is only half the size, and has the bot fly completely backed off the boards for being pestiferous. The horse in use can of course be protected by wire screens or other nets, but it is not so easy to relieve the pastured stock, especially if they are of range variety. We are wondering if other states are being bothered with this fly and whether they have any remedy. Can you enlighten us?—North Dakota.

REPLY—While screens, nets and sprays will aid in protecting work stock, it is rather impracticable to make use of any of these where stock runs in pasture or on the range. The chief breeding place for flies is the manure heaps and if these were not permitted to accumulate, or were daily sprayed with strong coal tar disinfectants, it would materially reduce the annoyance. Unless a community would co-operate in such work the efforts of one individual would not count for much.

CARE OF MARES—Can you tell me how to care for mares at foaling time, also care of colt? I have handled horses for years, but I have never cared for mares with foal. They are in fine condition now and I work them every day for exercise, nothing heavy. Anything you can say bearing on this I will certainly appreciate.—Idaho Subscriber.

REPLY—There is nothing particularly different in the way of care for mares that are in foal from other breeding stock. The main thing to

SNAP FOR STOCKMEN

$5 to $15 Per Acre.

For Missouri or Oklahoma lands, practically all in native blue stem grass, 50 per cent subject to cultivation, fine running water, two to eight miles from Kansas City Southern Ry., and only 200 miles straight run to Kansas City market.

Cattle and hogs are being raised and laid down on the K. C. market at less cost and greater profit than at any other point in the southwest. Pasturage most all year 'round. Clover, alfalfa, corn ,etc., make good crops. Ample rainfall. Most of land in native timber with fine grass.

BEST HOG COUNTRY IN THE WORLD

Stock hogs come from this section because they are free from disease and it costs practically nothing to raise them.

Fine climate. No bad blizzards or hot winds. Ideal country to enjoy life and make money. This same land put in fruit is netting annually $100 to $150 an acre. Tracts of several hundred acres or more at $5 to $15 per acre. For particulars address **Wm. Nicholson, Immigration Agent,**

KANSAS CITY SOUTHERN RAILWAY, 671 Thayer Bldg., Kansas City, Mo.

Irrigated Farm Land

With Abundant Water Supply.

Grazing Land (Watered) and Timber for sale in Southwest Colorado. Irrigation facilities here are unexcelled and this has long been Colorado's best live stock section.

Fine, moderate climate; no extremes; tornadoes unknown.

155 acres fine private water right, 2½ miles from Mancos; 30 acres in meadow, timothy and red top. Alfalfa, meadow, grain land, small orchard. Good six room house just been remodeled. Hay barn 40x56. Horse barn, cow sheds, chicken house, shop, granary, ice house, etc. Good fence; $55 per acre; a bargain.

160 acres; good house; barn, cross fences; chicken house; sheds, etc.; four shares in storage system besides fishing in waste water. Four acres in cultivation. New farm; fine land; four acres in orchard; $5,000.

160 acres four miles from town; good small house; barn; fenced; partly under cultivation; fine land; $2,000.

Raw land, agricultural and grazing at $5.00 per acre.

W. L. Morse, Mancos, Colorado.

PARTNER WANTED.
OWNER OF FIRST CLASS STOCK RANCH.

Fully equipped, in Southwest Colorado, stocked with Percheron horses, Galloway cattle, Duroc Jersey hogs, besides other stock, desires to sell a half interest to young or middle aged man who has had practical experience in the handling of stock, purchaser to assume active management, $9,500 required, but would carry a part of this if necessary. Sickness the reason for selling.

Three acclimated Percheron stallions for sale, all young and good. Address, **M. F. Laycock, 608 Kansas Ave., Topeka, Kas.**

800 ACRE STOCK RANCH

For sale or exchange for other property in Kansas or Missouri; fine agricultural and grass land in Eastern New Mexico; 2 sets of improvements, including good windmills and wells. $10 per acre. For further particulars write **L. F. Williams, Murdock, N. M.**

TO EXCHANGE

For good Percheron stallion, 44 acres land; good improvements. Joining good Missouri town. Write **N. A. Schwald, Maxwell, New Mexico.**

HAVE RETIRED.

Old, and wish to sell. I will sell you this highly improved stock farm, good buildings; woven wire fencing; 485 acres. Can't be beat. Write **Lock Box 285, Wellington, Kans.**

160 ACRES OF HAY LAND

for sale or trade for pure bred horses; Percherons; mares preferred. Price $20 per acre. **F. D. Maddex, Arcadia, Neb.**

"REAL ESTATE WANTED."

Sell your property quickly for cash, no matter where located; particulars free.—Real Estate Salesman Co., Desk 9, Lincoln, Neb.

R. L. HARRIMAN, Bunceton, Mo.

The Fine Horse and Jack Auctioneer of the West

I sell more horses and jacks than all others. Terms always right: work always up to the highest standard.

WANTED.

A situation to handle the Capsule System. Had good success last season. Twenty years' experience in the breeding business. Have had charge of some of the highest priced stallions and jacks in the United States. Can furnish the best of references. Address, **Box 166, Columbia, Mo.**

$600 BUYS

The Rex Denmark—Black Squirrel bred saddle stallion, REX KNOX 3115. Black; 15.2; five years sound. A great acting show horse and sire. Fearless under saddle and in harness.

Also the ladies' beautiful saddle mare. MANCELONA II. Bay; 15.1; four years; sound; eligible to registration; safety city broken to saddle and harness and suckling fine foal by Rex Knox. Destruction of my barns by fire makes this sacrifice imperative. **W. T. Wilkinson, Eureka, St. Louis County, Missouri.**

FOR SALE OR EXCHANGE.

King Hal 2749; chestnut; snip; 10 years; weight 1100 pounds; sure; can guarantee him in every way. Goes all the gaits. He is one of the best individuals you ever saw. If you can fault him in any way will pay all expenses to see him. Traded all my breeding stock for him and my county don't suit for a saddle horse. This is all the stock I have so I will sell him for half of what he is worth or trade him for young jack or Percheron that has the quality and is all right. This ad appears but once. Don't write unless you mean business. **Address Box X, Wheatland, Hickory County, Mo.**

REGISTERED MORGAN HORSES.

My Morgans ars large; 15 to 16 hands and 1050 to 1300 pounds; have clean, heavy bone and possess all of the style and endurance for which the breed is noted.

For Sale—Weanlings to 3-year-olds, by The Admiral 4871 A. M. R., he by Jubilee De Jarnett. Send for catalog. **Richard Sellman, Rochelle, McCulloch County, Texas.**

21 HIGH CLASS STALLIONS

For sale at low prices for quality of stock. Eight saddlers, five trotters and eight Shetland ponies; royally bred and grand individuals—many of them prize winners in strong competition. For prices and full description, address **Barbee Stock Farm, Monticello, Drew County, Ark.**

EXCELSIOR SHETLAND PONY FARM.

Registered stock a specialty; a limited number for sale. **W. H. Fulcomer, Prop., Belleville, Republic Co., Kas.**

FOR QUICK SALE

A choice 2-year-old stallion saddle colt at a bargain. Large enough for service. **R. C. Obrecht, Topeka, Kas. Route 7.**

SADDLERS FOR SALE.

Thirty head of high class stallions at very low prices for next 30 days. Also services of Foss McDonald, Eastern Cloud and others. **H. A. Greenwell, Lakenan, Monroe County, Mo.**

STANDARD BRED AND REGISTERED

Trotting stallions for sale. Also young jacks and jennets as large as they grow anywhere. I guarantee them to be right. Come and see them. **Henry Obermann, Freistatt, Lawrence County, Missouri.**

SADDLERS.

40 saddle stallions, mares, colts and fillies of the best Denmark and Chief breeding. Special prices on stallions for the next 30 days. **J. F. Cook, Lexington, Ky.**

KENTUCKY JACK FARM
Established in 1884.

A fine lot of black Mammoth Kentucky jacks. Big bone and plenty of weight. Will sell at special prices in order to make room for young stock. We sell more jacks to the Western trade than any breeder in Kentucky. Write for prices or come and see me. Guarantee to please our customers.
Joe E. Wright, Junction City, Ky.

FAIRVIEW JACK AND JENNET FARM

32 Jacks and 35 Jennets, the best that grow, 14½ to 16½ hands high—jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address
J. C. HUCKSTEP,
Eolia, Pike County, Mo.
GRANDVIEW JACK FARM.

JACK AND STALLION

For sale. The jack is Brillador, by Brigadier, sire of the champion jack of State Fair at Dallas last year. Brillador is 15:3 hands high; coming four years; weighs 1100 pounds; plenty of style, and fully guaranteed.
The stallion is one of our regular stud horses (roadsters), but we have three and need only two.
McLaughlin Ranch, Water Valley, Tex.

Two Big Mammoth Jacks

for sale July 1st; 15 and 15½ hands high, or will trade one for a jennet spoiled jack if a good one. Mine both guaranteed breeders and performers.
John W. Carolan, Booneville, Ark., Route No. 3.

JACKS.

20 good black jacks and some good jennets; coming 3 to coming 8 years old. Large, heavy boned, broken to mares and prompt servers. Prices reasonable. Come and see me. Barns 2 miles from town.
Phil Walker, Moline, Elk County, Kas.

16 **SEE HERE.** 16

For sale: 7 black jacks from 3 years to 5 years old; all sound; prompt performers on mares; 15 to 16 hands. Three of them weigh over 1100 pounds each. 8 black Mammoth jennets, 14½ to 15½ hands high. One black Percheron stallion. His number is 11839; will make a 2100 lb. horse.
All cheap for cash or will trade for land within 100 miles of K. C.
W. W. Shott, Lathrop, Mo.

EIGHT JACKS FOR SALE.

Combining the blood of Autar, Black Giant and Lime Stone Wonder; all black, white points.
Have either a trotting or a coach stallion for sale or will trade for a good Percheron mare or jennets. Must be a good one. These horses are sound and the very best of breeders, but have one too many. **Chas. Wyatt, Petersburg, Pike County, Ind.**

keep in mind is to be temperate with them, to exercise such care as will preserve them from accident, and will not encourage sickness from exposure or errors in diet. One of the best guides when in doubt as to the proper care of animals is to place yourself in their stead, which will often give one a prompt hint of the proper course. Practice the Golden Rule on not only the human but the lower animals.

CASTRATING AGED STALLION—I have a grade Percheron, a good worker and individual. Have used him as long as I care to. He is nine years old. Is there danger of losing him if I should cut him?—Kansas Subscriber.

REPLY—We are not informed of how much personal experience you have had in castrating animals. When an operation is done by an experienced veterinarian it is accompanied with little danger. What would be a simple operation in a young animal entails far more care in the aged.

BOG SPAVIN HEREDITARY—Will a horse with bog spavin breed bogs in his colts? Would you breed to a horse of this kind?—Missouri Subscriber.

REPLY—If the stallion has this weakness the conformation may be transmitted to his progeny. After a reasonable time the foals may encounter certain accidents that will bring about this condition. If a colt does not have this weakness they might withstand these accidents without blemish. If the sire has a weakness it is not advisable to patronize him. There are many stallions that are full in the hock through bad management which are not cause from any weakness. Such stallions will not transmit these defects, as a rule.

ABORTION—I have a mare seven years old that has lost three or four colts. Carried two of these six or seven months (mules). I work the mare on farm; is a hard puller. This mare is in good shape now. Would like mighty well to raise a colt.—Kentucky Subscriber.

REPLY—You should read the article on abortion in another column. You will not make much progress in overcoming the trouble if you continue to pull this animal hard.

STRING HALT—One of my stallions shows the string halt the last two or three years. He is 13 years old and has never shown it before nor I do not know of any of his colts having it. He is an imported Percheron and has a gold medal. Some claim that I have no right to stand him. He was O. K. at ten years of age. He got hurt three years ago and quarter split one of his front feet and since that this has come on gradually, getting worse each year. Is it best or not to have him operated on for it? Some say yes and some say no. I have two stallions and work them out of the season. I think of leaving him at home on the farm and only taking the one.—Minnesota Subscriber.

REPLY—You should first have your stallion examined by a competent veterinarian for the purpose of learning whether or not the crack in the forepart is responsible for the string halt. If it is there is no reason why it should not be treated successfully and this objection removed. You can hardly encourage unfavorable comment by not having the crack attended to, as such conditions are usually easily repaired.

INJURED MULE—Please tell me what is the matter with my mule and remedy for same. About six weeks ago it got down in the stable and hurt its right hind leg and it throws leg out when it steps and knuckles some in pastern sometimes when it puts its foot down. Is swollen at pastern. It eats hearty.—Missouri Subscriber.

REPLY—It would be difficult to tell just where and how badly your mule has been injured, but we believe you should call in a qualified veterinarian to look the case over, as it is very likely the firing iron will have to be used before the case improves to the point of being useful again.

TWIN JACKS—I raised twin jacks and some people said that one of them would not breed, and some said they breed better. Do you know if there is any difference? I would like to know how it is with twins.—Missouri Subscriber.

REPLY—There is no good reason why twin jacks should not prove satisfactory breeders.

SWOLLEN SHEATH—I have a stallion that stocks (swells) in the sheath. Could you tell me what to do for it and what the cause?—Wisconsin Subscriber.

REPLY—Swollen sheaths are first most frequently induced by filthiness, rough handling when cleaning, or lack of exercise. Nothing of an irritating nature in the way of grease or strong soap should be used in cleaning a horse's sheath. A bran mash made up with warm water usually serves best, and is about all that is needed. A stallion troubled in this manner should be exercised daily and given access to a roomy box stall where he can continue to take exercise. If some of these points are observed it will do more to prevent swelling of the sheath than internal medication.

RUPTURED COLT—Kindly advise me what I can do with my colt. When it was born it was ruptured; it did not seem to be all right in its hind logs; was first lame in the left hind leg then in the right front leg and now it is lame in the right hind leg. These legs are very thick as though there was some pus in them. A veterinary told me it was from feeding the mare, as I feed her nothing but oats and hay. Would like to know if ruptures can be cured. This rupture is in the bag as big as a cocoanut. This same mare has slipped her colts for me before. The horse man told me I should not work the mare, which I did not this year, and now this horse man tells me I should have worked the mare.—Minnesota Subscriber.

REPLY—We would judge from your inquiry that your colt has navel ill in addition to being ruptured. A competent veterinarian should be able to treat the rupture successfully by resorting to a surgical operation. This operation should not be undertaken, however, until the colt has recovered from the navel trouble.

HEMORRHAGE—Will you please tell me what is the matter with my mare. The mare is about 12 years old; in fairly good condition. I bred her last year. Now she has been passing blood clots from out of the vagina. This has been going on for two months. I am very anxious to know what to do for her.—Washington Subscriber.

REPLY—You do not say whether or not your mare is with foal. It will require a careful examination at the hands of a skillful veterinarian to locate the true source of the hemorrhage. We would suggest that you have such examination made, as we cannot advise you how to treat the case until a proper diagnosis is made.

ABORTION—Will you please tell me if mares that have aborted in their fifth and sixth month of pregnancy will abort again if bred this season, if the mares are in a healthy condition? Will it be necessary to treat them, and if so, please tell me how. These mares had what our veterinarian called "pink eye." I am part owner of a good Belgian stallion.—Minnesota Subscriber.

REPLY—Numerous inquiries are still coming in about the subject of abortion. We refer you to a discussion of this disease in another column.

WARTS—I have a yearling standard bred colt that has warts on his muzzle. A veterinarian told me they would go off in time but they seem to be getting some worse instead. What would you advise doing? In your opinion would his having warts seem to indicate that his blood was too much out of order to allow of castration this spring? He is in only fair condition. I rather think he has worms, so have started feeding Sal Vet. Our other colts are doing fine. We are feeding clover and timothy hay with a grain ration of equal parts of corn and oats, all they will clean up well.Iowa Subscriber.

REPLY—Where warts are small and have a well defined neck they may be removed by ligating close up to the skin with a strong thread—or they may be snipped off with a pair of scissors and the part touched with a stick of lunar caustic. The warts should in no way hinder castration at the proper time.

FEEDING QUESTION—What is the best bran to feed stallions and jacks, mill run or the straight bran? This is something worth knowing, especially for me. Subscriber.

REPLY—We do not have a very high opinion of the feeding value of the bran as produced at present by our up-to-date mills. It is a splendid thing to fool a horse's stomach with. Bran containing the middlings or

A Few Jacks
And They're Good Ones

Still for sale. Big bodied, big boned, with plenty of height, good feet, heads and ears—the class that sire the highest priced mules and bring money to your community. Jennet herd headers, too.

Come and See What I Have.

J. H. SMITH,
Kingfisher, - Oklahoma

BARGAINS! **I am cleaning up my stock of Big Jacks and Draft Stallions**

And am making the lowest prices you ever heard of for stock as good.
Just come here, pick out what you want and if you don't buy it won't be the fault of the price.
I don't believe in having any good, serviceable stock left when the season ends, and this is the way I keep from it. Come and see.

W. J. Finley, Higginsville, Mo.

Headquarters for
Mo., Ky., and Tenn. Jacks

Sold singly or in carload lots. I guarantee more bone and more good Jacks and jennets than any breeder or dealer in Missouri. Every one black and from 15 to 16 hands high. Have them of all ages. Thirty-five years doing business with the public, and never had a lawsuit with a customer.
ED. BOEN, LAWSON, MO.
(Lawson is 28 miles from Kansas City.)

JACKS AND MULES

We have 14 jacks from one to six years old; have lots of bone, size and quality; all black with white points.
Also have 128 yearling mules, coming two year old, and 26 mule colts. These mules are from grade draft mares; have lots of bone and width. Only 15 out of the 154 are horse mules, the balance are mare mules. Will sell at reasonable prices. **Scott, Abney & Jenkins, Virden, Macoupin County, Ill.**

JACKS AND JENNETS.

Forty head of Mammoth jacks and jennets for sale. Jacks in age from colts to four years old; in size up to 16 hands. These jacks are all good ones; in this lot are two as good as grows—good enough to head any herd of jennets. I have one of the best herds of jennets in Kentucky. I raise all my own stock and will sell them worth the money. Write for prices today, or better, come and see them. **U. G. Saunders, Flemingsburg, Ky.**

TWO BLACK JACKS

for sale. Six and eight years old; good breeders. One 64 inches high; 70 inches heart girth; 9½ inch shin. Price $600. The other 61 inches high; 64 inch girth; 7¼ inch shin; blocky built. Price $400. Either one of these jacks will pay for themselves in a single season if rightly handled. Good terms to good parties. No trades. **G. T. Peage, Garrison, Mo.**

300 head of Colorado raised Jacks, Jennets, Mules and Brood Mares. All guaranteed. Prices right. **Lewis Swink & Son, Rocky Ford, Otero County, Colorado.**

JACKS AND STALLIONS

I can furnish a few extra good registered jacks and jennets, also a few choice draft stallions, for less money than any one. **L. Donaldson, Olney, Lincoln County, Mo.**

JACKS AND PERCHERONS.

25 biggest and best Mammoth jacks in Ky. Few Percheron stallions. Price cut from $100 to $300 on every one. Big stock high grade Percheron mares, Hampshire and Large Black swine. **H. T. Brown & Co., Lexington, Ky.**

CRUSHED OATS
ARE FAR BETTER FOR HORSES
and cattle than ground feed. Get a "NATIONAL" Oat Crusher. Up-to-date stock farms are rapidly adopting crushed feed. Hand and power sizes. Send for catalog. Agents wanted.

97 Warren St., New York.

shorts possesses more food value, as the average stock man can testify.

DISPLACED TESTICLE—I have a pure bred Percheron stud colt two years old this spring that weighs 1400 pounds. One of this colt's testicles is out of its place most of the time; it stays down near the end of the sheath, four or five inches from where it ought to stay, and at other times it is back in its right place. We have noticed it this way for the last year. What is the cause of this? Do you think as the horse gets older the testicle will stay in its right place? What do you think about serving four or five mares with this colt this summer?—Illinois Subscriber.

REPLY—The displacement is perhaps caused by a sacculation of the scrotum, and you might be able to adjust and pack a suspensory so that it would aid in keeping the testicle in place. By keeping the testicle in its proper place it may form a more perfect receptacle in the scrotum. A skillful surgical operation might correct the condition, but we are not in position to advise on this point without the opportunity of making a personal examination. If your colt is a good, vigorous fellow he might be bred to a few mares this season.

GARGET—I have a black cow eight years old and every so often one quarter of her bag seems to cake and gives stringy milk. It does not stay caked for only about two milkings and the next time it comes it is on one of the other quarters. She is in fair condition and seems to eat good and is healthy outside of this trouble. Her bag cakes once a week or goes a month or so. I feed her corn fodder with corn on and some oats and bran and she runs in pasture in day time. Is her milk good at any time? She had some trouble in cleaning, but is in calf again. Has been milking since last December.—Iowa Subscriber.

REPLY—Your cow has a catarrhal condition of the mucous membrane lining the sinuses of the udder which is frequently induced by food that is more or less eliminated through the mammary gland and proves irritating. You will have to make a close study of what she eats and reject any food supply that is moldy or has noxious weeds in it. The treatment consists in injecting solutions into the udder through the teat canal, and this you should not personally attempt, but turn that part over to a qualified veterinarian if conditions do not yield to proper regulation of the food supply.

OBSTRUCTED OS—I have a mare when I try to open her up there is a tight veil grown over the neck of her womb and it has to be torn to admit the fingers and it grows back before the mare gets in foal. The mare has had one colt and seemed to do well. Has not been bred for five or six years, is a good one, eight or nine years old.—Kentucky Subscriber.

REPLY—Mares with obstructions of this nature should be bred with a capsule, which insures the semen entering the proper part of the genital tract.

IMPACTION IN COLTS—Will you please tell me what to do for young colts just foaled in order to move their bowels. I see remedy for colts getting the scours, but not for constipation.—Utah Subscriber.

REPLY—The safest practice is to give these little fellows warm saline injections per rectum. The impaction is usually in the posterior bowel and can be best reached in this way. A fountain syringe answers very well for this purpose. Use a heaping teaspoonful of common table salt to a quart of water which should be injected at body temperature. It may be necessary to repeat the injections at intervals of one hour for two or three times. The colt should be encouraged to retain as much as one-half or two-thirds of a pint so as to secure the mechanical effect of the water in softening up the mass.

FISTULA AND POLL EVIL—Is a poll evil or fistula contagious? I have

ABSORBINE
TRADE MARK REG. U.S. PAT. OFF.

YOUNG, P. D. F., 388 Temple St., Springfield, Mass.

three head of horses out of 17 that have it. I have no low places such as a shed for them to get bruised.—Missouri Subscriber.

REPLY—While it is generally recognized that abscesses involving the poll or withers are dependent upon some external injury in the nature of a bruise, yet it is a matter of common observation that when the disease appears on one's premises there is very apt to be several animals affected. We believe it very poor practice to permit a diseased animal to run with or mingle with the remainder of the herd. The disease is dependent upon a certain class of micro-oganisms and they should not be allowed to spread broadcast over one's premises.

RETAINED AFTERBIRTH—A neighbor of mine had a mare retain the afterbirth 18 hours. He sent for me and I made an examination and found the afterbirth grown to the end of the cornua and the cornua was telescoped nearly to the cervix. I used nearly four gallons of sterilized water and then sent for a veterinarian. He cleaned the mare up in good shape. How long after using the hot water does it take for the afterbirth to come away?—Idaho Subscriber.

REPLY—You did the right thing in making free use of hot sterilized water in this case. Whenever the afterbirth is strongly adherent, one should not forcibly remove it but should continue daily flushing until it comes away easily. If one uses force there is great danger of producing lacerations which open the way for infection and death from septic metritis.

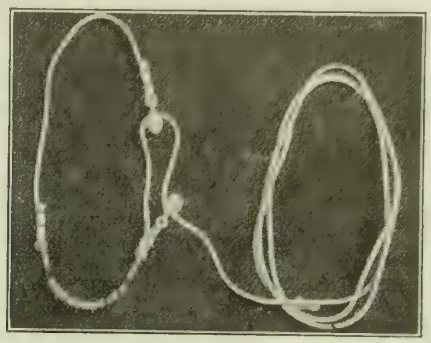
PARALYSIS OF THE BLADDER—I have a yearling mare colt that never has made water naturally but is constantly dribbling, and this spring it is taking the hair off her legs. Can you tell me what to do?—Kansas Subscriber.

REPLY—We fear you have an incurable case, inasmuch as it would appear that your colt is affected with paralysis of the sphincter muscle of the bladder.

RAISING A COLT ON COW'S MILK—As I have a colt which lost its mother when a day old, and I am raising it on cow's milk, please inform me, through your valuable paper, how much to feed, how often and how much milk does the average brood mare produce?—Washington Subscriber.

REPLY—When first teaching a colt to drink one should give it milk every two or three hours. The amount given should be governed by the age and size of the colt, but the little fellow should always be underfed so as not to provoke indigestion. Be very careful on this point. Dilute the cow's milk about one half with warm water that has been boiled. Add a couple teaspoonfuls of lime water to each pint of milk. Feed warm. As the colt grows older the time of feeding may be lengthened to three times a day and the amount increased as the condition of the colt justifies. You will find that the colt will soon learn to eat oats and bran if placed within easy reach.

LAME STALLION—I have a four year old imported Belgian stallion that is lame in the left front foot, leg or shoulder. He walks slightly on the toe and is inclined to thrust the ankle forward. Some days he is lamer than others. Has been in this condition most of the time since last October. He gets better and then worse. I have given no treatment other than to bathe in hot water the foot, leg and shoulder. Please advise some treatment.—Kansas Subscriber.



REPLY—You are not exercising good business judgment in neglecting this stallion and permitting this lameness to go on until it becomes so chronic that your animal may be ruined. Why not have had this animal examined months ago and the lameness located, when a very few dollars would have covered the cost of treatment?

SWELLING IN THROAT—I have a mare six years old, value $200, that has a swollen neck under where throat latch works. Has been there quite a while. It is very hard. It affects her wind like a wind broken horse. She is a great brood mare; heavy in foal. Would be pleased to have a cure.—Ohio Subscriber.

REPLY—You have a good subject for personal investigation by some well qualified veterinarian. A growth of this nature might yield to repeated vesication or it might be more feasible to have it removed by surgical means. We are in no position to advise you just what ought to be done, but feel safe in saying that it would perhaps be best to delay doing anything until she has fully recovered from foaling.

THE RIGHT WAY

Jack Sores Cured
By Using Jack Sorine. Sold With a Cash Guarantee.

N. B.—When we started this ad a year ago the American Breeder required us to deposit $500 with them, to insure the protection of every subscriber who bought **"Jacksorine."** We have sold several hundred boxes, and only 8 buyers failed to work a cure. These got their money back.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in a substantial box and sent promptly by mail. It is a paste and applied with a small brush three times a day.
Send money by bank draft or P. O. money order. Price $5.00.
O. P. WILSON & CO., 3754 Wayne Avenue, Kansas City, Mo.

BREEDING APPLIANCES OF ALL KINDS

THE IMPROVED CARLSON SEMEN EXTRACTOR AND CAPSULE SYRINGE

This extractor has been improved so that it is much easier to use. The proper temperature can easily be maintained. Anyone should have good results with this instrument by following the directions carefully. This is the only instrument made that has been successfully used for getting the semen from the uterus. We believe this instrument with its improvements will make it possible for any ordinary breeder to use the capsule system successfully. It has a soft metallic point that will stand bending a thousand times. All necessary directions will be sent with the instrument.

Special Offer: 50 pointed breeding capsules, price $1.00; a tested hot water thermometer, price $1.00; the improved Carlson semen extractor, price $7.50; **ALL FOR $7.50.**

Microscopes

For use in testing the semen of stallions or jacks. Magnifies 500 times and is used by veterinarians and physicians. Price $35.. Boxed in fine case. These instruments are of great value in the breeding business. Through them you can see for yourself and show your mare owner the live spermatozoa of your sire.

Thermometer

Tested and used for keeping water at the right temperature.

Price, $1.00.

Veterinary Thermometers

This thermometer is recognized and used by the leading veterinarians for taking the temperature of animals. It has a metal case which insures it against breaking and will last a life-time. It has a small chain with pin in it that may be fastened to the vest pocket and carried with safety.

Price, $1.25.

Curved Metal Impregnator

This instrument is sold by other dealers for from $5 to $6. It is nickel plated, about 22 inches long, with a glass tube in it.

Price, $4.00.

Breeding Hobbles

We have heretofore handled breeding hobbles made by reputable firms, but we have received so many complaints that we are now manufacturing our own hobbles. They can be adjusted to fit a small pony or the largest draft mare. We believe these are the only hobbles made large enough for draft mares. Most hobbles are made to fit the common race mare.

Price, $8.00.

Emasculator

This emasculator (improved style) is made by the Kny Scheerer Co., and bears their trade mark. It is guaranteed to give satisfaction. If it breaks within one year or gets out of order, return it and get a new one. This instrument is made of the very best steel. It is the latest method, only having three pieces and can be taken apart very easily and thoroughly sterilized. It operates perfectly. Price, $7.00.

Pointed Breeding Capsules

We have the only capsules made especially for horse breeding Some capsules do not dissolve, leaving a foreign substance in the uterus which will prevent conception. Other capsules are too flimsy to use for this purpose. You cannot make any mistake by buying capsules from us as we only have one kind. We have them boxed with 100 in each box. The box is tight so they will be clean. These capsules are properly baked and all bacteria killed before they are mailed. Always keep the lid on the box when not in use.

Price per box (100), $1.50.

Bulb Impregnator

This is the best bulb impregnator on the market. Some dealers sell for $5 and $6.

Price, $2.00.

Breeders' Bags

Three sizes, small, medium and large. Stallions weighing 1,200 or 1,600 pounds usually require a medium size. These bags are guaranteed not to tear from any cause before March 1, 1914. If they do tear before that time return the top part with our stamp on it and 35 cents in cash and we will send you a new bag.

Price each, $1.00.

Directions for Ordering

Send money orders or draft as exchange is always charged on personal checks. Always name your express office as well as your post office address in order to insure prompt delivery.

POSTAGE AND EXPRESS PAID ON ALL ORDERS.

BREEDING APPLIANCES OF ALL KINDS

THE IMPROVED CARLSON SEMEN EXTRACTOR AND CAPSULE SYRINGE

This extractor has been improved so that it is much easier to use. The proper temperature can easily be maintained. Anyone should have good results with this instrument by following the directions carefully. This is the only instrument made that has been successfully used for getting the semen from the uterus. We believe this instrument with its improvements will make it possible for any ordinary breeder to use the capsule system successfully. It has a soft metallic point that will stand bending a thousand times. All necessary directions will be sent with the instrument.

SPECIAL PRICE ON EXTRACTOR AND CAPSULES

Until further notice we will sell 1 box of 50 pointed breeding capsules (price, $1.00), and one Improved Carlson Semen Extractor, complete as described above (special price, $6.50), ALL FOR $6.50.

Pointed Breeding Capsules

We have the only capsules made especially for horse breeding Some capsules do not dissolve, leaving a foreign substance in the uterus which will prevent conception. Other capsules are too flimsy to use for this purpose. You cannot make any mistake by buying capsules from us as we only have one kind. We have them boxed with 100 in each box. The box is tight so they will be clean. These capsules are properly baked and all bacteria killed before they are mailed. Always keep the lid on the box when not in use.

Price per box (100), $1.50.

Bulb Impregnator

This is the best bulb impregnator on the market. Some dealers sell for $5 and $6.

Price, $2.00.

Veterinary Thermometers

This thermometer is recognized and used by the leading veterinarians for taking the temperature of animals. It has a metal case which insures it against breaking and will last a life-time. It has a small chain with pin in it that may be fastened to the vest pocket and carried with safety.

Price, $1.25.

Thermometer

Tested and used for keeping water at the right temperature.

Price, $1.00.

Breeding Hobbles

We have heretofore handled breeding hobbles made by reputable firms, but we have received so many complaints that we are now manufacturing our own hobbles. They can be adjusted to fit a small pony or the largest draft mare. We believe these are the only hobbles made large enough for draft mares. Most hobbles are made to fit the common race mare.

Price, $8.00.

Emasculator

This emasculator (improved style) is made by the Kny Scheerer Co., and bears their trade mark. It is guaranteed to give satisfaction. If it breaks within one year or gets out of order, return it and get a new one. This instrument is made of the very best steel. It is the latest method, only having three pieces and can be taken apart very easily and thoroughly sterilized. It operates perfectly. Price, $7.00.

Microscopes

For use in testing the semen of stallions or jacks. Magnifies 500 times and is used by veterinarians and physicians. Price $35.. Boxed in fine case. These instruments are of great value in the breeding business. Through them you can see for yourself and show your mare owner the live spermatozoa of your sire.

Curved Metal Impregnator

This instrument is sold by other dealers for from $5 to $6. It is nickel plated, about 22 inches long, with a glass tube in it.

Price, $4.00.

Breeders' Bags

Three sizes, small, medium and large. Stallions weighing 1,200 or 1,600 pounds usually require a medium size. These bags are guaranteed not to tear from any cause before March 1, 1914. If they do tear before that time return the top part with our stamp on it and 35 cents in cash and we will send you a new bag.

Price each, $1.00.

Directions for Ordering

Send money orders or draft as exchange is always charged on personal checks. Always name your express office as well as your post office address in order to insure prompt delivery.

POSTAGE AND EXPRESS PAID ON ALL ORDERS.

VOLUME 6. KANSAS CITY, MO., MAY 20, 1913. NUMBER 9

SCIENTIFIC HORSE BREEDING

Information Essential to Success in the Most Important Branch of Our Live Stock Industry and On Subjects Concerning Which Ignorance Has Prevailed.

By FRANK B. GRAHAM.

Note:—The following article, written by Mr. Graham last winter, in response to many requests from horse breeders who heard him lecture, has been published and quoted from, probably more widely than any other article ever prepared on the general subject of horse breeding. A score or more of the most progressive live stock and agricultural journals have printed it in full and quotations from it have appeared and are still appearing in all parts of the country. Some of the features have been covered by special articles already published in the American Breeder, but so great has been the recent interest, especially on the part of mare owners who have not heretofore made a general study of this subject, that we are printing the article in full. Many of the oldest horse breeders on our list have written us lately that they are now having better success than ever before, largely as a result of a more hearty support on the part of mare owners who have learned through the American Breeder what scientific horse breeding really means to them; more and better colts, less loss of time, less danger from spreading disease, and (without added cost) a better class of stallions as the profits increase. We have reached the point where the best class of mare owners and stallion owners realize that their interests are mutual.

From now on more attention than ever before will be given to showing our thousands of new subscribers of this class that the up-to-date stallion owner is their business ally and worthy their fullest co-operation.

The first thing necessary in studying horse breeding is to get a fair knowledge of the anatomy of the male and female animals. Learning the names, functions and locations of parts is easy. A little time will make the average breeder very proficient in this direction. I have heard breeders say they could not learn those big names. But they are mistaken, any breeder can accomplish this if he will only give it the proper application. Without this information the breeder is not in a position to read intelligently or to give satisfactory reasons for carrying on experiments.

It may not be generally known, but a great many stallion and jack owners, even some who have been in the business a great many years, open the mouth of the bladder instead of the cervix when they "open a mare." When a mare is opened the hand which is used in that process should be washed with soap and water and rinsed in sterilized water so that the operator will not carry any infection into the uterus. The uterus of a mare is a peculiar organ; in many cases it has a cavity from two to four inches deeper than the os uteri. Excepting through absorption there is no way that infection bearing matter can escape from the uterus but to drain through the os uteri. Then if infection is introduced into the uterus the fluid matter may accumulate to a considerable depth before it can escape. The uterus of a mare is one of the best mediums in which to grow bacteria. It is not unusual to see a stallion or jack owner have a bucket of lard or other grease in which his hand is immersed before being inserted into the vagina, with one finger into the uterus. Others have used soap. All of these agents are injurious. Other breeders believe that it is necessary to insert two or three fingers into the cervix in order to open a mare sufficiently—some of them insert four fingers. This manipulation creates an irritation which is responsible for many mares not fertilizing. One finger is sufficient in a case of this kind. More mares are made barren temporarily through the opening process, under the average management, than are ever benefited. It is necessary occasionally to open the cervix before a mare is served.

A careful estimate of the mares in this country that have raised colts to weaning age is one mare out of each three bred. This is a remarkable condition. There are many factors at work in this process. In all other civilized nations breeders charge a part of the service fee at the time of service, so that most of the shy breeding mares are not bred. But in the United States the "stand and suck" custom invites all mares to be served regardless of their diseased condition. This custom is so well established that I do not believe it advisable to try to make any change, for it would only make a harvest for the inferior sire. The country is full of stallions that would not even make good geldings, whose owners are willing to guarantee the colt old enough to work before the service fee becomes due.

When in communication with stallion and jack owners one would believe that the per cent of foals was anywhere from 80 to 100, but by having the opportunity of confidentially investigating a large number of service record books, one learns conditions in a more authentic way, on the subject. The low per cent of foals in this country attracted my attention a great many years ago. I sold a stallion to an individual under a breeding guarantee and the stallion did not fill it. This surprised me greatly, for I had stood this horse the year before. After I had investigated this case I found from the service record book that each time following the breeding of a certain mare several other mares failed to conceive. This particular mare (as well as others of the same kind) was examined. Since then I have been investigating this matter a great deal further and have been able, by means of a culture secured from a diseased mare, to produce disease in a clean, healthy, productive dam to the extent that she would not fertilize during that year under any condition. In the spring of 1910 I resolved to carry this matter on from a scientific stand point and learn more about it. I employed several expert veterinarians to assist me in the examination of more than 1,000 barren mares. Among those were Dr. S. L. Stewart of the Kansas City Veterinary College, who was the successful investigator in finding the particular germ that is the cause of a great many mares being barren. These germs were injected into a clean, healthy mare, and this mare was destroyed and examination showed the condition that this infection produces. This work was carried on with many subjects (mares and other animals) producing the identical symptoms in each case, and in each animal dissected the same germs were found. All of these animals were previously healthy in the genital tract so far as could be diagnosed.

It is very interesting, indeed, to inspect a clean, healthy mare, using a speculum to diagnose the condition at the time of infection and then to notice the great change that has taken place in that genital tract in five days. The investigation along this line was carried on under the supervision of Dr. A. T. Kinsley, one of the best bacteriologists in the world. A statement of this investigation has been sent to nearly every graduate veterinarian in the United States and accepted so far without any questions. The results of this investigation are probably the most important secured in all horse breeding history.

A stallion may serve a diseased mare containing these germs and transmit that infection to clean, healthy mares as long as two to four days after copulation. It does not seem to affect the penis of a stallion or jack, as in other cases of veneral diseases. This is probably the reason that this subject was never investigated. The first thought is that the penis of a stallion may be washed to prevent conveying infection to other mares. This is impossible, as a rule, for the glans penis is expanded during the act of copulation and usually wrinkles soon after ejaculation to the extent that it conveys enough infection to be serious. There is a small place on the penis (fossi) where the bean forms that is impossible to clean without an instrument to inject fluid into it as a cleanser. This is a serious condition and the only remedy at the present time is for the stallion and jack owners to reject all suspicious mares and not breed them with natural service at least. Every up-to-date stallion or jack owner should be able to diagnose certain conditions. We are sorry to say that the stallion and jack owners know less about their business than any other class of men—horse breeding is a profession now days. Many a stallion and jack owner is spreading infectious disease among the mares; that means a great loss to his community as well as to himself financially. Stallion owners who are capable of making certain examinations with a view of refusing to serve diseased mares with a natural service, can usually increase their per cent of foals from to 30 per cent.

The movement to make stallioners realize the necessity of this information must first start with mare owners. If they demand more intelligence in their horse breeding operations a great change will take place. The stallion or jack owner's business has been a "side line" too long. It must assume the position of a recognized profession before any great results in this line can be accomplished. A lot of stallions are being ridden throughout the country that have no value as producers, yet they are patronized extensively because they are convenient. I have seen the owner of a valuable mare refuse to patronize an excellent sire within two miles of his own place because a little mongrel would be brought to his barn without any inconvenience to him. It is this stock that prevents the purchase and use of valuable sires all over this country. If mare owners would study this situation and realize that colts sired by little misfit mongrels would be necessarily produced at a loss, they certainly would pay more attention to the selection of good sires. There are always men who, if they can buy an animal for a song, and use it to the extent that they make better wages than they could make as farm hands, will follow that occupation. It is up to the intelligent mare owners of this country to refuse to patronize this inferior breeding stock and to give their assistance in discouraging their neighbors from raising so many horses that fill no market place, and are at the present time a drag on all the leading horse markets. The market for good horses and mules was never in a better condition. Mules are worth $10 a head more now than they were one year ago. Horses will reach the highest price in American history before April 1. (This came true). What is the use of producing a misfit that can not be used satisfactorily or sold for enough to pay for its production?

During the last few years a new method in horse breeding has been established. One mare may be served and a dozen mares bred from that one service by extracting the semen from the first mare served. During the period of all early text books it was taught that the discharge of a stallion or jack was made in the vagina. This was proven to be untrue. More than one-half of such services are injected into the uterus when a normal mare is served by a good serving stallion or jack. This has been the difficulty in artificial breeding; the operator could not get the semen. Many experiments have been tried in the way of breeder's bags, mare bags, cervical plugs and other devices. The only successful method employed in this direction is an extractor having a soft metallic point that may be inserted into the uterus and bent down to the lower part of that organ. By this means the semen of the stallion is drawn into a syringe where it may be immersed in warm water at 100 degrees and there kept a considerable length of time. A special capsule with a pointed end, made of the best material, is filled half full and inserted into the uterus of the next mare to be bred, and so on until all the mares present are served. Twenty mares can easily be bred at the average service of a mature draft stallion, as eight ounces is the average discharge for an animal of this kind. The per cent of breeders that are making a success of the capsule system is greater than the per cent of those who breed by the natural service. There are failures in both classes. There is this advantage in the capsule system, that when properly employed it is a complete service. The semen is deposited directly into the uterus

where it must be deposited before fertilization can take place. A large per cent of the services made are not complete with the natural service; a great many mares have had difficulty at a previous foaling resulting in the cervix being closed or not in a proper position so that the spermatozoa could not find its way into the uterus. Such mares would not fertilize with the natural service under any condition.

It has been estimated that 20 per cent of the shy breeding mares can be fertilized with the capsule system when all other methods fail. With the capsule system only one service a day is necessary. This should be at a particular advertised hour so that all customers could be there at one time and save much annoyance in the way of making dates and crowding the stallion. With one service a day the spermatozoa is stronger, a greater per cent of mares will fertilize and the colts have more vitality. It is not uncommon for a stallion or jack to sire as many as 200 colts in a few weeks of one spring's service. When a dozen or more mares are bred each day the opportunities are greater. From the average discharge of a mature stallion there are millions of spermatozoa, only one of which is necessary to cause fertilization; the balance are wasted. There is no danger of getting the ovum, or female egg, when extracting the semen, as it is not liberated from two to five days after the heat period has closed. Fertilization in the mare takes place in the uterine duct, near the horn of the uterus. It is frequently claimed that foals gotten by the capsule system are not as strong, or may be deformed in some particular. This is only used as an argument by those who are not able to employ such system, or that of a competitor who wishes to injure the up-to-date breeder. There is absolutely no difference in any respect in the colts except that the tax on the stallion being less, the average vitality of the colts is higher

A great many of our valuable sires are being injured each year by an excess of services. Not more than two services one day and one the next (no two services closer than ten hours) should be employed for any length of time by any stallion or jack owner. There are those who contend that stallions or jacks are capable of making a great many services in one day, and prove it by records obtained in Europe. I have tested numerous stallions in Europe with a microscope and find that they can not successfully make a great number of services each day for a great length of time. The reason that mares fertilize under a condition of this kind is that in Europe regular routes are made, as a rule, so that in case a mare does not settle at one heat period she may be bred again. Every stallion owner should have a microscope so that he can test the semen of every service and know just what his sire was doing. Mare owners should demand this service so that they would have a means of knowing whether the stallion was fertile. The semen under a 500-diameter microscope will show thousands of spermatozoa that look very much like wiggletails in great motion, if a stallion tests satisfactorily. Then the mare owner may know that his mare is not in breeding condition if she does not stand to the service. When natural service is employed quite frequently a stallion or jack may be out of condition for days at a time. Some stallions can stand a little more service than others. Occasionally a stallion or jack can not discharge live spermatozoa more than once a day when used regularly for two weeks.

The best method of "trying" mares is to tie them to a hitch rack, removing all harness and bridle, leaving them perfectly quiet for a few minutes. Then the stallion may be brought out and led around the mare

(Continued on page 16).

COUNTY FAIRS OFFERING $1,000 SHOW HORSE PURSES.

To the American Breeder:—Enclosed find notice of most remarkable evidence of interest in draft horses in Missouri.

As secretary of the Draft Horse Breeders' Association, I would thank you to give this matter publicity.

Sincerely yours,
E. A. TROWBRIDGE,
Missouri College of Agriculture.

With the above letter Prof. Trowbridge enclosed a special premium list of a Missouri four-fair circuit for show horses, at each of which $4,000 is offered in purses—$1,000 in each of four rings, or $16,000 hung up in the four fairs. This new move is in accordance with a recommendation which Prof. Trowbridge is making, and in which he says: "Horsemen cannot afford to shape horses to show at but one fair nor can they afford to ship a long distance for the next show. I think agricultural fairs, that have racing circuit should put on show ring circuits for the leading breeds. Offer as liberal purses and conditions as associations feel justifiable in doing. Associations can require a certain number of entries to fill, and thus protect themselves. Have entries close some thirty days before date of first fair on circuit. Any ring not filling, notify each nominator ten days after entries close and return entrance money; thus protecting each exhibitor. He would then never ship to a fair unless he knew his ring was filled and when he did ship, he would know he would get to show for the prize offered."

The four fairs in this circuit, with their dates, are Knox City, August 12 to 15; Green City, August 19 to 22; Pattonsburg, August 26 to 29; and Trenton, September 2 to 5; all on Q. O. & K. C. railroad. Each offers $4,000.00, to be provided and competed for under the following conditions:

The Four $1,000 Purses.

Ring No. 500. Best registered Percheron Stallion, 3 years or over. $1,000
Ring No. 501. Best registered English Shire Stallion, 3 years or over. $1,000
Ring No. 502. Best Saddle Horse, mare or gelding, 3 years or over. $1,000
Ring No. 503. Best Roadster Horse, mare or gelding, 3 years or over. $1,000

Conditions.

In all above described rings, five per cent of purse required to enter and five per cent additional deducted from winners.

Twelve entries required in each ring, no horse can win more than one money in one ring, but nominators may make as many entries as they desire, by paying upon each entry.

Money divided, in each ring, as follows: First, $300; second, $200; third, $150; fourth, $125; fifth, $100; sixth, $75; seventh, $50.

Entries close July 15, 1913, when each animal must be named and five per cent of purse must accompany each entry.

Nominators have the right to substitute another animal, in case of sale or accident, any time before the fair opens, provided the animal nominated is not shown.

If entrance fees amount to more than guaranteed amount of purse, all surplus will be offered as consolation purse for horses not standing as good as fourth in the ring where the surplus occurs.

No entrance charged in consolation, and such money divided 50, 25, 15 and 10 per cent.

Any ring that does not fill, the nominators will be notified within ten days after entries close and entrance money will be refunded.

In ring number 503, judge will consider speed, action, style, size and endurance, but conformation, manners and soundness to be considered.

Ring No. 502, rules of American Saddle Horse Breeders' Association to govern.

Premiums will be awarded by an expert live stock judge that has been endorsed by the Agricultural College of Missouri.

Good box stalls $2.00 each during fair. Bedding free.

Good water furnished on grounds.

T. R. Davis of Green City, Mo., is the circuit secretary and will furnish premium lists or other information on application. Prof. Trowbridge is urging other Missouri county fairs to take up this plan of encouraging better horse stock in the state.

Questions and Answers.

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

NASAL CATARRH—I have a jack that took the distemper two and a half months ago, taking same from a horse; later he took a fresh cold caused by being in a shower of rain. Have smoked him with tar and cotton rags. Discharge has changed from a dark offensive to a clearer one without odor. Had this jack gleet? Please give treatment.—Texas Subscriber.

REPLY—The treatment you are giving your jack, while a popular one, is often responsible for extensive irritation of the mucous membrane of the upper air passages, and we have known of the death of the animal resulting from a too persistent application. Application of mildly medicated vapors serve better and with less danger to the animal. A porous sack may be arranged about the muzzle of the animal and the opening at the other end connected with a pail of hot water. Every few minutes a few drops of oil of eucalyptus may be placed on the water and on account of its volatile nature it will quickly vaporize and the animal will inhale it.

LAME COLT—I would like to know what is the matter with my colts up to coming four years old. One got so lame he could hardly move; trouble was in the front knee between the legs; some swelling and was hot to the hand. I greased it with lard and one-third kerosene and now he moves fairly good, but seems lame in shoulder blade. He is three years old and in good flesh and not worked. Then I have several coming three years and one four years old. First their upper lip swelled extra large and terrible sore; four days later as swelling went away they broke out all over the lips and nostrils like little warts, oozing some watery blood; neither case was sick to note. What is the trouble with the colts and what can I do for them? They are fed corn speltz, some hay, an open range and a stack of Russian thistle to run to.—Nebraska Subscriber.

REPLY—Your lame colt was probably injured in some way, and very likely if you apply soap liniment to the parts every one or two days, and permit the colt to run in the pasture, he will come out all right. Your other colts have come in contact with something that has produced extensive local irritation, and you should investigate the food supply for the cause. Should you be able to find the cause the cases will no doubt recover rapidly upon removing it. In the meantime bathe the parts once or twice a day with a two per cent creolin solution.

INFECTION—I have a neighbor that has a horse that had the distemper about two years ago, and the distemper settled in his legs and they are swollen very badly and one of them is still in bad shape. They had it operated on about six weeks ago; they cut about seven pounds off of it. It is still swollen some and is raw from in front of hock down to the hoof. The horse isn't much lame, but it don't seem to heal at all. It gets at times dry skin over it, then chokes and bloody water runs out of it. Can there be anything done for it If so, please give me instructions.—Pennsylvania Subscriber.

REPLY—It would be folly for us to attempt to prescribe for a case of this kind. You need the personal attention of a competent veterinary who can keep in touch with the progress of this case. If you cannot do this, the humane thing to do is to have the horse destroyed.

CONTRACTED TENDONS IN FOAL—Will you please tell me the cause of colts being born with the cords of their forelegs contracted so that it is impossible for them to stand and suck. Some people think it is caused by working the mare too hard; others lay it onto the stallion. Is there any cure?—Montana Subscriber.

REPLY—Abuse of the mare has some influence on the offspring, but the main cause of misshapen limbs is a long distorted position assumed by the foal while in the uterus. The great majority of these crooked young things outgrow their deformities in a few months.

UNTHRIFTY SOW—I have a sow that weaned her pigs in October; she was too cold; she shivered when the other hogs did not. I can't get her fat. She is a year and a half old.—Mississippi Subscriber.

REPLY—We would judge that this sow was suckled down thin and being in this condition late in the fall makes it difficult to arouse a gain in flesh without a little extra care on your part. When a sow is found in this condition she should be given a pen by herself and fed milk, house slops, shorts, oil meal, etc., something outside of the usual corn diet. If this is done, as a rule, they can be made to thrive. A run at grass this time of year would be one of the very best things you could do for her and give her an opportunity to root in the earth for such things as she needs. You should also know that she is not infected with worms. A standard remedy for this trouble is advertised regularly in these columns.

SUSPECTED PARASITES — We moved here early in December with two cars of colts and breeding mares. People said we would have shipping fever, etc. The stock did very well until the last 30 days; suckers and yearlings going back very fast; getting good feed of grain twice a day and stabled at night; eating good all the time. Once in a while one coughs a little and one rattled a little in throat; not as bad as often in winter up North. Are getting very poor for amount of grain fed. Have to lift with rope every time they lie down. Cannot see much wrong. One man says horses always get that way here every winter. I wrote to station veterinarian and have had no reply. Think after putting in $12,000 to $15,000 in land and two cars of breeding stock he might write me. Can you give me any idea what to do? One man here says give pine tar once in a while. Stock does not seem as bad off as they often do with distemper, but seem to get so weak.—Mississippi Subscriber.

REPLY—We suspect from the nature of your complaint that your animals are infested with some form of internal parisites, and we would think with the number of head of animals you have that it would pay you to secure the services of a good veterinarian that he may have an opportunity to look these cases over carefully and find out the cause of this rapid decline. One thing is certain, if you do not do something soon, you are going to meet with extensive loss.

PARALYSIS—I lost a stallion coming two years the 19th of April; died five weeks ago. I had two veterinarians but they did not know the cause. He was all right at night, but in the morning he set up, but could not raise his hind parts off of the ground. Died the next morning. The doctor drew his urine and it was all right. He would eat hay and grain. His feed consisted of oats and corn and a little flax meal. The veterinarian said his care and feeding were all right. He had a large stall to exercise in and was not haltered. The veterinarians said they did not know what the trouble was, but pronounced it paralysis. He was in terrible misery before he died; worked himself around in a circle; kicked a hole in the partition; was dripping wet with perspiration just before he died.—Iowa Subscriber.

REPLY—It would appear from your description that the diagnosis made by your veterinarians was correct,

but it would be mere conjecture to suggest a cause of the trouble. The majority of these cases result from injury, the animal having been cast in the stall.

SLOW SHY BREEDING JACK—I have a jack six years old that I bought last season; his former owner had him two seasons, but only worked him a little at the end of second season, and that with the aid of a jennet. At the beginning of last season his former owner started him in for me with the aid of a jennet, and all at once he started to work without the jennet and did fine for three weeks; then all of a sudden stopped and had to go back to the jennet. From what I can learn he got about 60 per cent of the mares in foal. This season I started him in myself with the aid of the jennet, and have to use her right along, but the queer part is that I don't seem to get any mares in foal; they are all returned. If some one had given him Spanish fly last season, would that have hurt his fertility for this season? Is it dangerous to use the stuff? Would rheumatism hurt his fertility? He was complaining last February for several weeks with what the veterinary called rheumatism, but has been strong and well and hearty ever since, and is in good condition.—Kansas Subscriber.

REPLY—We have known some very good jacks to be ruined from feeding drugs. Rheumatism might make your jack slow, but should he make a service, the semen probably would test satisfactorily.

MARES RETURNING—I have a black colt three years old in May. The mares seem to return. He is in good condition; has a box stall 16 feet and a run in a lot almost every day, and he moves some when he is out. I have other horses in this corral night and morning. He smells and makes urine some. He bred six mares last year and they are all in foal; were strung out from May until September. Sometimes I have to let him serve three times before he discharges. He is very ambitious. Of course, he frets some; the semen looks thick and clear; he seems to discharge a large amount and there is some waste when he dismounts. I started him slow with no two services closer than 24 hours; three mares a week. Am almost sure that he does not abuse himself. Can I make him sure next year?—Oklahoma Subscriber.

REPLY—Test the semen with a microscope; if the test is satisfactory, use another stallion for a teaser. Sprinkle a little hay under the stallion so he will urinate before you put the bridle on him. Allow the stallion to mount before the erection is too severe. After the entrance has been made allow the mare to take a step or two. By this method he is not so likely to fail in the service. It is best not to have other stock in the paddock where this colt is allowed to exercise. If the semen test is not satisfactory, watch your colt day and night to see if he is masturbating. If he is not masturbating, you should be able to make a successful season with him.

A BITING STALLION—Will you please advise me in regard to a stallion I have which has a bad habit of biting a mare while serving her. Does not bite them on top of the neck, but bites them on the shoulder; does his biting with his corner teeth. How can I break him of this habit? Have tried a muzzle and also a strap; these seem to make him mad. When he gets hold of the mare if I try to get him loose he will dismount.—Illinois Subscriber.

REPLY—Wrap the stallion bit so the stallion cannot bite and allow him to wear this arrangement until he gets familiar with it, then it will not be new to him when he has an opportunity to bite. A sweat pad may be so arranged to prevent his biting the mare. Some breeders use a collar with a very large sweat pad made for that special purpose.

SLOW JACK CLIPPED—Would clipping a jack make him slow to serve a mare, or be harmful to him?—Iowa Subscriber.

REPLY—Be careful about your jack taking cold. He should be blanketed for a few nights. If he does not take cold the clipping should not make him slow. In fact, it would be a good plan with many slow jacks to clip them and give them a cold bath every morning

(Continued on page 14.)

Capsule Breeding Outfit

You have not made it plain as to just what will be needed in capsule breeding. I have been using an impregnator for some years with some success, but wish to be more up to date and get a better per cent of foals. I notice the Kansas City Impregnator Company advertises a Carlson semen extractor, fifty capsules and a hot water thermometer, all for $7.50. I have a good hot water thermometer and do not wish to buy another one. It is my intention to breed a few mares with capsules and get a little practice so that I can adopt the entire system next spring.—North Dakota Subscriber.

The Kansas City Impregnator Company has changed its advertisement, and now offers an Improved Carlson Semen Extractor complete with the new point protector and other improvements, with 50 pointed capsules, all for $6.50. The new extractor is much better than the old one. The mucous membranes do not clog the suction so easily with the new point protector. The point protector also serves as a cut off valve. By turning the point a little it closes the extractor so that it may be laid in warm water and kept there for several hours with very good results at this time of year. This makes it possible to keep the semen for a few hours by having a "cracker box heater" under the pan in which the warm water is kept. In this cracker box two small No. 2 lamps are placed and regulated so that the water can be kept at about 100 degrees F. for a considerable length of time. Breeders are using this simple method now and it has been found very successful. When the semen is to be kept for several hours a tablespoonful of salt should be boiled in the water in which the extractor is to be immersed.

The principal tools for capsule breeding are an improved Carlson semen extractor, a hot water thermometer, special pointed breeding capsules, a pan 40 inches long, eight inches wide and six inches deep and a cracker box with two holes cut in it so that the heat from the two lamps located under the box, will regulate the temperature of the water. When semen is to be kept any length of time the temperature of this water should be regulated sometime before the breeding is started, so that the temperature will not change. All water must be boiled before it is used. A few gallons of water may be boiled in advance and placed in jugs so that it will cool and can be used for cooling the freshly boiled water.

A microscope is a very useful instrument in horse breeding, and sooner or later every breeder who expects to remain in the business should arrange to have one of these. It is also an excellent advertisement, because mare owners can look for themselves and see the evidence of the virility of the sire. They will talk about this at many gatherings. The operator also knows just what he is doing when a microscope is used, and its use has often saved ten times its cost by detecting trouble when it first appeared.

The fact that it has been found possible to keep the semen alive for several hours so that mares can be bred at any time, should make it very interesting for every breeder. Great care should be taken, however, to keep the right temperature and be clean with the work and follow the rules for capsule breeding. By using the Improved Carlson Extractor, with the cut-off valve, semen is not changed in temperature and is protected from contact with light. A little salt boiled in the water gives it an alkaline condition, which favors the retaining of its vitality. For only a few dollars a breeder can prepare to breed practically all the mares that come to his place. One extra colt should pay for all of the tools necessary for capsule breeding.

There is another advantage in this for those who are not able to convince their customers that the capsule system is satisfactory, and that is that after a mare has been bred and the semen extracted from her, other men will come later, usually one at a time, and are more easily convinced that capsules are all right than when a body of them are assembled. When the owner takes a mare to the stallion and the stallion has been used, he can usually be persuaded to use the capsule rather than to make a date at some future time when the mare might not be in heat, because he is very likely to be quite busy at this particular time.

To the American Breeder:—Mr. Ellis of Sentinal, Okla., bred a mare to his jack March 9, 1911; tried her in 18 days; she showed signs of heat, and he bred her to his stallion; rebred her every 18 days with horse for five times, and on May 22, 1912, she brought a mare mule. I am personally acquainted with Mr. Ellis and he told me of the case himself.—A. B. Minier, Kiowa County, Okla.

GOOD LETTER AND A GOOD JACK.

To the American Breeder: Some time ago I advertised a good jack for sale and it certainly brought in letters of inquiry. We got three or four letters every day for several days. We consider it a great paper. We sold the jack to a man about fifteen miles from us. We have a young jack colt and I should like to ask the readers of the American Breeder if it is a good one or not. Here is his description: He is black; 40 inches high; 25 inches from tip to tip of ear; 32 inches around girth; 5 inches bone smallest place below knee. Is he a good one or not?—A. T. & Geo. W. Steelman, Green County, Ill.

To the American Breeder:—I see where Mr. Dad Sprague of Clay county, Ohio, and W. L. Garratt, Smithfield, Henry county, Kentucky, have been telling of their jacks. I have one, too, which can take theirs down. My jack was foaled August 25, 1905; steel grey; 16½ hands high, standard measure. Will weigh 1,300 pounds now. Girth, 72 inches; flank, 76 inches; arm, 22 inches; knee, 16½ inches; below knee, 10 inches. He is a great jack. He has some fine mules and some fine jacks. He serves mares and jennets well. Is smooth and fine.—Albert Beaverkamp, Grayson County, Ky.

To the American Breeder:—I wish to thank you for the splendid paper which you are putting out. Think it is great and should be in the hands of every man that is raising horses. Feel confident that after reading it they will all try to raise better ones than they have been raising. I keep only a few mares, but find it a great help.—J. F. Martin, Winfield, Cowley County, Kas.

Stallion Service Record Book for Two Hundred Mares—The latest and best on the market, as cheap as the cheapest. It is a handy pocket size, with 224 pages of strong bond paper and a waterproof cover. It has a calendar, a gestation table and an index of twenty pages so that each mare can be found easily. Each mare has an entire page. This book can be used for several sires without carrying more than one at a time. Notice how easily it is to record the breeding of a mare and give the details. This record book is the result of the opinions of many breeders. It has no worthless advertisements in it. If you are not satisfied with it, return it and get your money, which will be cheerfully and promptly refunded to you. Price 50c each, postage prepaid. Published by

PROFITABLE HORSE BREEDING.

A breeder states that he does not wish to adopt the capsule system as he is afraid the percentage of foals would not be large. The percentage of foals depends largely on the breeder. If he selects all barren mares he cannot expect to get them all in foal, but it is a settled fact that a stallion or jack can only make so many natural services, and the business cannot be enlarged by the natural service. If there are a number of mares present on Saturday or a rainy day, why should he object to using the capsule on all the mares present that are in a breeding condition? He will be a very poor operator if he cannot get some of them in foal. He will make his regular services anyway, and have all the capsule colts a clear profit. If he fails on any of these mares he can still have an opportunity to breed them with natural service later.

This kind of talk does not show good business judgment because if the operator is careful with his work and breeds producing mares, so that later on he will have colts to show by this system, he can enlarge his business and make more money. The capsule system is profitable for any breeder, no matter what kind of a horse he may have. It is not expensive. One extra colt will pay the whole bill and after his business grows and he gets his community accustomed to this way of breeding, he can buy the best horse in the country and make plenty of money. Every extra horse that is kept requires feed and attention. They are expensive. If one stallion can take the place of several, the profit can easily be seen. The mare owners will take readily to this because it saves them a lot of time if they can be convinced that it is as good as the natural service.

We cannot understand why a lot more breeders do not get enthusiastic over this proposition. With the great opportunity now of learning something about horse breeding through the American Breeder school, we expect great results, but if the breeders are satisfied with their financial success, and do not want to learn anything, we cannot force it upon them. The writer has had a world of experience along this line; he has seen thousands of men who have made extra money, and many who have doubled their business without increasing the investment to speak of. We have hopes of convincing every intelligent breeder that the sooner he begins to study this subject the more money he will make.

FAILURES IN CAPSULE BREEDING.

There are failures in breeding with capsules just the same as will be found in the natural service. During the last breeding season the writer spent considerable time investigating those who had made failures.

At one place a breeder was making three natural services a day and using the capsule system. The stallion was so nearly exhausted that there were no live spermatozoa in the semen. He was not getting his mares in foal with the natural service either. This individual supposed that all that was necessary would be to put some fluid in a capsule and breed a mare. He did not realize that it was necessary for that semen to contain live spermatozoa that look like "wiggle tails" under the microscope.

At another place where a breeder had made a failure, he had not boiled the water in which the extractor was immersed. This water was taken from a rain barrel which was full of wiggle tails and other germs.

At another place the breeder did not wash his hands nor boil his instruments, so that he could not expect any results.

At another place a breeder had a large bottle in which he would put the semen and keep it in warm water. When he would breed a mare he would get new semen and put it in the bottle without cleaning the bottle. I asked him to smell of it and he made an awful face. It was "stinky," yet he expected to get results.

At another place the breeder was doing the work by himself; instead of having some mare owner help him he would bend the soft metallic point up and let it stick out of the water, then when he would fill a capsule the fluid would run through the cold end of that extractor, which would destroy the life of the semen.

At another place the breeder filled all of the capsules and left them lie on a dirty table and would use them as he could; before he would get one capsule in the rest would be nearly dissolved, and all of them would be chilled.

At another place where the breeding was done it was so dirty and dusty that the writer could not stay in there long. What results could anyone expect in a place of that kind?

At another place a breeder said it was not necessary to boil the water in the pan where the extractor was immersed, as he had tested the water with his microscope. He had only a 500-diameter machine with which he could not test the water.

At another place a breeder did not have an extractor but used a cervical plug in the mare so that he could rake the semen out into a pan where the direct rays of the sun could destroy the life of the semen. The direct rays of the sun does this very quickly. All breeding must be done in a shady place or at least the semen must be kept out of the direct rays of the sun.

The great difficulty with capsule breeding, or any other line of business, is to get the breeders to thoroughly study the printed rules. There has been connected with artificial breeding several grafters who have advertised the "easy to use" method. There is no "easy to use" method. If the breeder does not learn how to use the capsule system, he will make a failure. But there are not as many failures as we expected. The men who have made the most failures have received their education from those "easy to use" grafters. Some of them have been able to produce a few colts —just enough to aggravate their patrons. If we could get these individuals to thoroughly understand that if the semen from a stallion or jack, deposited into the uterus of a mare in a clean, natural condition, at the right temperature and containing live spermatozoa (which is all any stallion or jack could do) much better results would be obtained. But they must remember that these conditions must be provided.

There is probably not a man living but what actually knows of one or more colts that have been produced without the mare being served either by a stallion or jack. If one colt can be produced, why can't more of them be produced? They can. It is just a question of whether the breeder wishes to study these things and learn just how to do it or not; that is the only question. This is not difficult if it is studied a little and carefully done.

It is a mighty poor individual who does not expect to improve, no matter what kind of a stallion or jack he may own at the present time. A little thought in this direction might make it profitable for him to purchase an excellent sire—one good enough to get practically all the business in that community.

If breeders would look ahead several years and make calculations for something better, more results could be obtained. Every man who aims high has to improve his condition. There are a lot of breeders who own stallions or jacks that are making as much of a failure with the natural service as any of these men have made with the capsule system. That is, they are getting far too little for their work. They cannot afford to follow such an occupation unless they can receive more money for their services. Those individuals who have failed with the capsules have been breeding with the natural service—perhaps to the limit of their stallion—just the same, and all the capsule colts they have gotten, are extra. Every failure, however, when the capsule is used, makes it that much harder to introduce this method.

RETURNING MARES FOR TRIAL.

The 21st day after a mare has been bred should be the regular retrial date. If she is not in heat at that time she should be tried once a week for three weeks. There is very little use to retry a mare sooner than the 21st day. Some men contend that the 18th day is the proper time. They will frequently be in heat at that time, but in nearly every case where mares are in heat on the 18th day they will be likewise on the 21st day and being nearer the end of the heat period, better results should be expected. Many mares are served too soon.

CARRIAGE HORSES.

This spring has witnessed an increased demand for fancy carriage horses. There are more of these used on the boulevards of Paris this season than has been noticed for several years. This has also been noticed to some extent in other large cities. The automobile has seriously interfered with the common, plain, light horse, but fancy driving horses will be in demand.

We believe there ought to be something done in the way of an American Carriage Horse Registry. We have spoken of this before, but there are not many who care to venture an opinion as to how this should be originated. The government has spent considerable money in breeding this class of live stock. It is not expected that a proposition of this kind should grow and flourish from the very start. It requires a considerable length of time to thoroughly establish blood lines that will produce certain characteristics.

We will be very glad to have suggestions from our readers as to the best method of establishing a registry for American carriage horses.

DON'T WAIT TOO LONG.

Inquiries are already coming in from mare owners who are having navel trouble among their colts. We have repeatedly urged that both mare owners and stallion owners take steps early to prevent navel ill, as treatment after the disease appears is usually without effect. The method of prevention which we have described several times is simple and inexpensive. Not only can the navel powder which the American Breeder puts up and mails out to its readers at a price barely covering the cost, be used successfully on colts, but it can be used with equal success on calves, pigs and any other young stock. But to get the good from this remedy it must be used promptly and regularly in accordance with instructions.

It takes very little time to do this, in fact, no more time than every careful stock raiser ought to give to seeing that the newly born animals on his farm are in good condition. A little time and a little thought beforehand can save hundreds of dollars every spring on farms where a considerable number of animals are raised. A can of the navel powder which we send postpaid to any subscriber for 50 cents, will ward off navel infection from a dozen or more colts or calves, if used according to instructions. The main thing is to **get it and use it on every colt and calf as soon as dropped.** More young stock ailments than you imagine (including scours in the worst form), have been traced to infection through the navel cord.

FALL BREEDING SEASON.

We believe the average breeder would do well to have a fall breeding season. There are many mares that are out of condition for the spring season and are bred every three weeks that do not seem to have anything wrong with them, yet they do not fertilize. These same mares will get in a better condition after the spring work is over and they have had some grass and more freedom; their circulation is better. These mares are not only expensive to the stallion or jack owners, but to their owners. It requires a considerable time to return these mares at every heat period.

We believe it would be an advantage to both parties to let many doubtful mares go over until the fall season when the mares are in a better condition and the sires are not so busily engaged. It is not necessary to have a long breeding season; those who are busy may advertise a short season. It is better, however, that the breeding season be extended through the entire year so far as the sires are concerned.

Some mare owners object to having fall colts, but the average breeder will readily concede the fact that it is better to have a fall colt than none at all. After a mare has been tried and she does not settle, a proposition of this kind might be made to the owner to an advantage to all parties concerned. The owners of these mares should be advised as to the advantage of letting these mares run in the pasture as much as possible. There is perhaps no other condition that will get as good results on these mares as green grass, and especially during the spring months.

This does not refer to diseased mares, as they must have treatment, as a rule. Even the diseased mares that have been treated should also

have an opportunity to settle during the fall season if unsuccessful during the spring months.

KEEPING THE SEMEN.

At last a method has been discovered which is giving good results in keeping the semen for several hours. This will be very convenient for breeders generally, as the great difficulty in artificial breeding has been to get a large number of mares together at one time. If the operator is careful with his work the semen can be kept for several hours with the new improved Carlson semen extractor. The point protector on this instrument is also a cut off valve. That is, it can be closed so the semen in the extractor can be immersed in warm water without the semen and water being mixed or coming in contact with strong light. Full instructions for keeping the semen will be found under the title of "Capsule Breeding Outfit" in this issue. This simple method by which the semen can be kept in a good condition for several hours will still more rapidly increase the capsule method of breeding.

COLTS DIED WITH NAVEL DISEASE.

To the American Breeder:—Two of my mare owners have each a high grade Percheron mare and both mares have had now their third colt, and all of their colts died with navel disease, although both parties have never had any trouble with their other mares' colts. Both parties blame those mares. If there is no way of saving the colts from these mares they have decided not to breed them again. What causes this trouble with the colts from these two mares? Would you advise such mares to be bred again? How could it be prevented? We would be very thankful for your advice and information.—L. E. Heimsoth, Thayer County, Neb.

There is no particular reason why these two mares should lose their colts in this manner. If you would buy a can of navel powder and loan it to these two men it is not likely that the colts would die with navel infection. One can would probably serve these two customers as well as several others. The price of this powder is 50 cents per can at this office.—Editor.

"AS TAUGHT BY THE AMERICAN BREEDER."

To the American Breeder: All I have learned about capsule breeding has been through the columns of the American Breeder, and by following ideas and suggestions as laid down by that paper I have been very successful. I have made a very careful study of horses and their natures and dispositions, and find the capsule system of breeding, as taught by the American Breeder, far better and surer than the natural service, and of course it is more profitable.

I have had extensive experience with shy breeders and find the only sure way to settle them is by the use of the capsule three or four days after the heat period has passed, as taught by the American Breeder. In breeding a very nervous mare it is far surer to make use of the capsule and not allow the mare to see the stallion or jack. As I am very proud of my success in breeding with the capsule system I have made critical comparisons between the capsule colts and those of the natural service and find no difference; they are as good in every respect.

I would say to those contemplating the use of the capsule system the only way to make sure of success is by using good instruments. I use the improved Carlson impregnator and pointed capsules, as sold by the Kansas City Impregnator Company. Any one owning a stallion or jack will find it greatly to their advantage to get the capsule equipment complete—impregnator, pointed capsules, speculum and hot water thermometer. Also if they will read the American Breeder closely and be prepared to use the saline, soda and iodine treatment, as laid down by this paper, success will surely follow.—A. G. McDaniel, Hemet, Cal.

CAPSULES O. K. FOR BOTH KINDS.

To the American Breeder: The capsule system is the only way to breed mares. We have tried it on mares that were shy breeders and those that were easy to settle, and have found it O. K. on both kinds. I have been in the horse business about twenty years and have learned more about the business in the last three years than all of the previous years. I certainly give the American Breeder the credit for what I have learned in the last three years.

The school that is going on in the American Breeder at present is worth many dollars to all who are standing horses, and to mare owners as well. Don't you think we are not interested in your school. We were the first in this section to impregnate mares. We first began to use the breeders's bags, but soon found out that they were injurious to the horse, so was just about ready to quit that on account of it hurting the horse and jack, and about that time a copy of the Stallion and Jack News fell in our hands, and we were so well pleased with what we learned in the first copy that we subscribed for it at once. Every copy gives us new thoughts and we want to thank you for such a paper.

As for the colts, there is no difference. We built a house 20x30 feet to breed in, with a small office in one corner and the pit on one side. We breed as many as six mares at one service of the horse or jack. We examine every mare before we start, and have a two-hole gasoline stove. We followed your directions in having our pan made and are getting along fine.

Now, brethren, if you don't at first succeed, don't give up. The fault is in you, provided you have the horse or jack that is sure.—J. E. Stamps & Son, Pembroke, Ky.

ADVERTISING PROVED SUCCESSFUL.

To the American Breeder: I hand you herewith check covering statement, which I kindly ask you to receipt and return. The advertising of my sale in your paper proved quite successful, and should I do any more will bear your paper in mind.—C. B. Warkentin, Newton, Kas.

SENT HIM TO THE RIGHT PLACE.

To the American Breeder:—I am one of those unfortunate beginners of live stock breeding. I know a great deal about breeding and that consists of knowing that I don't know anything at all. I think when a man finds out that he knows nothing and is willing to go down and dig up the stuff of experienced breeders he is then in position to learn something.

I have written several publishing companies asking them where I could get the breeding subjects treated minutely, and have been told there was an "American Breeder" that made a specialty of the subject, so I am asking what kind of a paper you publish, price, etc.

I am handling a horse and jack; have a fine stand and am pushed to the limit to acccmmodate the customers. Is it necessary for one season to be harder than another? If so, is there any remedy for these hard seasons? The old fillies seem to be a little wrong this spring. They come in and are bred, then refuse for 9, 18 and 21 days and decide to take again. This, however, is no fault of the horse. This is getting me in the middle of a bad mix, as I will not make more than two leaps per day.

I have heard quite a bit about capsule breeding and other modern methods. I would like to know if there is anything to them. If so, which is the better, and if it can be done successfully by one of ordinary intelligence. This is the only way I see to compete with the common scrub stuff. If you can't tell me what I want to know, can you cite me to one who can? We have comparatively a new country and people are just beginning to breed for better stock, and as I like the business if I can make a success of it, would like to make it my business instead of a side line. Begging your pardon for such a long letter, I close.—W. E. Loveless, Beckham County, Okla.

APPRECIATION THAT COUNTS.

To the American Breeder:—I have been reading your paper for 12 months and think it is a grand paper. Would not be without it. It is something that every farmer and stock raiser ought to have in his home. I have got five new subscripers and will try and get some more next month.—Henry Reichmann, Randolph County, Ill.

Horse Market Continues O. K.

Farm Demand For Heavy Horse and Mule Stock a Factor. Cattle 25 to 35 Cents Below Early May Prices. Hogs Have Risen 25 Cents Above Point to Which Packers Pounded Them.

Continued activity, broad demand, firm prices are the chief characteristics of the horse and mule market to date. Horses are favored a little more than mules, but all are selling with readiness. Dealers say the general trade is healthy, and as big as the volume of receipts will permit. Country buyers say that it is close picking in the country, as horses are really scarce. Farmers have no real reason to let their working force fall to a point where they have not an extra team or so, and many of them have only enough work animals to meet urgent needs. With some, if one horse gets injured, or a sore shoulder, or other ills, a whole team is idle for the need of one extra horse. And if the short team farmer is lucky he can put his horses through spring and summer work without rest, bringing them to a point in the fall where it requires all winter to get them ready for spring work again. An extra team affording an occasional rest to the regular workers means far more to an animal than to a human, and short team capacity is a drawback on any farm.

The most important demand for horses is coming from the cities and the farm. About the same class of horses is required in both places. Farmers now are anxious to get good drafters, and the city buyer wants the same kind. Some farmers are satisfied with a common lot, and likewise some city business will put up with crow baits. However, the country has shown a greater demand for increased quality than the city. While demand is active, the next few weeks is expected to see receipts lighten and the trade become dull. Late June to late August, the hot months, are periods of the smallest requirements. Summer work has been provided for, and it is too early to start on fall buying. Some dealers say they expect a fair demand up to the middle of July. Southern horses have sold readily, but that outlet is beginning to narrow on account of the advanced season.

Heavy mules are in fairly urgent demand, but the lighter kinds are selling slowly. Levee and harvest requirements are making the principal outlets. Kansas, in the next three weeks, will increase its orders for heavy workers, and as harvest approaches, demand is expected to take an urgent turn. After showing a big increase in receipts the first two months this year, the movement in the past two and one-half months has fallen short, and the total receipts of horses at the principal central markets thus far this year are nearly 25,000 short of the same period in 1912. That shortage will have to be overcome before there is any fear of a setback in prices.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs. up.	$250@300
Drafters, fair to good	175@245
Chunks, fair to choice	135@175
Chunks, fair to good	90@130
Expressers and light draft	60@120
Plain workers	50@ 90
Southerns, good	135@165
Southerns, plain to fair	85@130
Plugs.	15@ 45
Mules—	
13 to 14 hands.	$ 95@140
14 to 15½ hands.	135@175
15½ to 16 hands.	165@215
16 to 16½ hands.	210@300

Sagging Prices for Cattle.

Weakness has been the prevailing characteristic of the cattle market in two weeks past. Prices fell to new low levels for the year, and at the low prices demand was extremely dull. Compared with two weeks ago prices are 25 to 35 cents lower, extremes of 35 to 50 cents showing, but a possible 15 cents having been regained. Demand was more at fault than the supply. Receipts were no more than normal for this season of the year, but packers have taken repeated layouts in the trade, and on days when the supply showed a liberality of beef they reduced prices, and shrunk the offerings to the limit before they went over the scales. The top price for strictly prime steers in Chicago within a week past was $8.90, and $8.50 in Kansas City. Either bunch of cattle last October to November would have brought $10, or better. The chief impetus packers have had for reducing prices is a slack demand for beef. In the past month wholesale beef prices have been reduced 2 to 3 cents a pound on ribs and loins, and rounds and chucks are about unchanged. Beef in carcass has declined about 1½c a pound. This is in keeping with the decline on cattle live weight, but the consumer has noticed no appreciable change in his meat bill. The bulk of the killing steers are bringing $7.50@8.25 on the native side, and $6.25@7.15 on the quarantine side. Cattle from below the quarantine line show grass, but most of them have had a ration of cottonseed cake. Straight grassers from the Southwest will begin to move freely by the middle of June. At present prices steers that left the yards as heavy feeders six weeks to two months ago will not pay the board bill. Fed cattle, however, have been marketed closely and live stock men who have watched the trend of marketing say prices are due for an upturn. Grain fat steers at no time this summer will be scarce like last year, but as grass becomes more plentiful, mature beeves will be less plentiful than now. The big movement of grass fat steers from Kansas and Oklahoma pastures will not begin before the latter part of July, and if the season is favorable, cattle will be held on grass as long as possible. There is little prospect for greenish catte showing better prices than at present later in the season.

Quotations from the various grades of killing steers are as follows:

Prime corn fat steers	$8.40@8.60
Good to choice steers	8.00@8.35
Fair to good steers	7.40@7.95
Common to fair steers	7.00@7.35
Meal fed, choice	7.30@7.90
Meal fed, Common to fair	6.00@7.25

Butcher Cattle Down, Too.

Continued declines for fat steers unsettled butcher cattle prices and the market showed the weakest turn in the season. Tidy weight heifers and steers and heifers mixed sold at $7.50@8, and some prime steers and heifers brought $8.25. Prices were quoted off 25 cents on that class and down 35 to 40 cents on the plainer kinds. Cows showed about the same decline. A good many cows are showing grass sap and packers are ready to discriminate against that kind. Traders see no reason for an advance in cows and heifers. They have been relatively too high all season compared with steers, but the summer season promises aonhter short run of she stuff and no low prices are probable. Veal calves continued in active demand. Prices were advanced 50 cents, and then fell away 25 to 50 cents. The extreme top was $10.50. Bulls and stags were quoted off 25 cents.

The following quotations are for the various grades of butcher stuff:

Cows—	
Choice.	$6.75@ 7.25
Fair to good	5.75@ 6.70
Common to fair	5.25@ 5.70
Canners.	4.00@ 4.50
Heifers—	
Choice fed	7.75@ 8.25
Good to choice	7.25@ 7.70
Plain to fair	6.25@ 7.20
Common.	5.25@ 6.20
Veal calves	4.50@10.00
Bulls.	4.25@ 7.25

Stockers and Feeders Lower.

Stocker and feeder prices have declined 15 to 25 cents in the past week. At the lower prices demand is active, but the volume of trade is small, owing to the few thin cattle offered. Feeders are paying more for feeding cattle now than values for fat steers justify, and some readjustment in prices will have to be made. Either thin cattle will have to decline, or fat steers advance. Feeders are quoted at $7.50@8.25, stockers $7@7.85, stock heifers $6@7.50, and stock coks $5@6.50. Stock calves are rather scarce at $6.50@7.85.

Selected feeders	$ 7.75@ 8.20
Good to choice feeders	7.40@ 7.70
Plain to fair feeders	6.75@ 7.35
Good to choice stockers	7.35@ 7.75
Selected stockers	7.75@ 8.00
Plain to fair stockers	6.75@ 7.70
Stock calves	6.00@ 7.75
Stock cows	4.25@ 6.00
Stock heifers	4.75@ 7.25
Milch cows	35.00@90.00

Narrow Fluctuations in Hogs.

The decline in hog prices which was so prominent the last two weeks in April, seems to have been checked, and in the past few days prices have been stronger. The lowest point of the season was reached the first week this month when the bulk of the offerings brought $8.10@8.20. Since then about a 25-cent rise has been reported. Receipts of hogs are beginning to decrease. The April movement was larger than expected, but it was maintained at the expense of the May supply. Though fewer extreme light weight hogs are coming now than two weeks ago, there has been a falling off in extreme heavy weights, and 200 to 215 pound grades are the prevailing type. The average weight of hogs the second week in May was 208 pounds, 5 pounds less than in April, and about the same as a year ago. Sows that lost their pigs in March are being rebred, and the summer run will show fewer grass-widows than in a number of years past. Provisions have shown an upward tendency in the past few days and as summer demand begins to absorb surplus stocks of cured meats and lard, the hog market will derive strength from that source. Prices now are high, considering the cost of fattening, but prices will not be reduced before another crop of young pigs is available for feeding.

The following table shows the range in hog prices in the last two weeks of April:

		Preceding Week.
Mon., May 12	$8.15@8.37½	$8.20@8.40
Tuesday.	8.15@8.40	8.25@8.45
Wednesday.	8.20@8.42½	8.15@8.35
Thursday.	8.25@8.45	8.15@8.30
Friday.	8.25@8.45	8.15@8.35
Saturday.		8.20@8.35

The following quotations are for hogs on April 16:

Choice, 250@300 lbs	$8.30@8.40
Choice, 200@245 lbs	8.35@8.45
Medium weight	8.40@8.45
Light weight	8.40@8.45
Common to fair	8.20@8.25
Stags.	7.00@8.25
Boars.	4.00@5.50
Bulk of sales	8.30@8.45

Sheep Prices Lower.

Sheep prices have been forced down by a liberal supply of goats. Goat meat properly is not mutton, but much goat meat is being sold under that

GUNN'S 2-HORSE, GUIDER ROAD BUILDER

Fair associations, clean the pole, and build up the turns.

Sold on 15 days trial. Guaranteed to move more dirt with less draft than any machine made. Two levers, one tilts the blade any angle, one raises and lowers the rear end of blade, leaving the dirt where you want it, crowning road bed smooth.

Made in 2 sizes
7-ft blade, $20
10-ft " $25
7-ft weighs 200
10-ft " 250

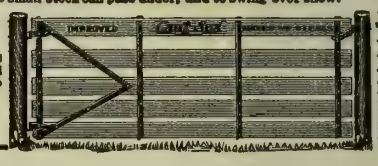
"Can't-Sag" Gates Save You BIG MONEY (6)

Alvin V. Rowe, Pres.

Cost only one-third as much as ordinary iron, wire or gas pipe gates, but last twice as long. Neat in appearance—best and strongest gate made—light, easy to handle, opens both ways. Boards are double *bolted* between eight angle steel uprights and double truss braces. *guaranteed never to sag.*

Cost Less Than All Wood Gates—Last 5 Times as Long



Can't Sag Gates are furnished complete, ready to hang, or just the Gate Steels which include everything except the boards. Patent self-locking hinge feature---reinforced two piece malleable hinges. Six Triangular Truss Braces make gates extra strong.

Improved Elevating Attachment permits the gate to be raised full length from 5 to 30 inches, so small stock can pass under, and to swing over snow.

30 Days Free Trial and 5 Year Guarantee

Catalog shows both complete Gates and just the Steels, at prices you can't afford to miss. Send for my new catalog with free 30 days' trial and *freight prepaid offer.*

AGENTS—$173 IN TWO WEEKS.
Made by Mr. Williams, Illinois, selling the Automatic Jack Combination 12 tools in one. Used by auto owners, teamsters, liveries, factories, mills, miners, farmers, etc. Easy sales, big profit. Exclusive county rights if you write QUICK. Automatic Jack Company, Box O, Bloomfield, Ind.

name and consequently prices were lowered. The first week this month goats sold at $5.10, and now they are worth $3.25@3.85. Sheep and lamb prices are down 25 to 35 cents and the market is weak at the decline. Some spring lambs are coming, and are selling much lower than a year ago. Wooled lambs are quoted at $8 @8.40, yearlings, hardly any available at $7@7.50, wethers $5.75@6.50, ewes $5.50@6.25. Clipped lambs are quoted at $6.50@7.50, clipped native sheep $5.25@6.25, and clipped Texas $5@5.70. Fairly liberal supplies seem assured for the next few weeks.

INDIANA CATTLE FEEDERS' CONVENTION.

To the American Breeder:—The annual spring meeting of the Indiana Cattle Feeders' Association at Lafayette, Ind., Saturday, May 23, 1913, will offer cattle feeders an opportunity to observe the difference in profit to be secured from feeding cattle on different rations. Purdue experiment station now has on feed seven lots of steers. These cattle will be ready for market at the time the convention is held. Valuation of the cattle will be made by commission men from Chicago and Indianapolis. The cost of cattle, rate and cost of gain, and profit per lot, will be discussed by men in charge of the feeding. The opportunity will thus be offered for the visiting cattle feeders to see the steers and to know the cost of the fat cattle and their value on the market. This will give the comparative profits to be secured from the following rations:

1. Shelled corn, soy bean meal, oat straw, corn silage.
2. Shelled corn, cottonseed meal, clover hay.
3. Shelled corn, cottonseed meal, corn silage.
4. Shelled corn, cottonseed meal, clover hay, corn silage.
5. Shelled corn, cottonseed meal 4 pounds daily per 1,000 pounds weight, oat straw, corn silage.
6. Shelled corn, cottonseed meal 2½ pounds daily per 1,000 pounds weight, oat straw, corn silage.
7. Oat straw, corn silage, cottonseed meal for 70 days and shelled corn added to the ration after this time.

The problems of producing beef in the corn belt are yearly becoming more perplexing. Numerous factors have a bearing on the solution of the problem. A discussion of "Beef Production in the Corn Belt" will be given by Prof. W. A. Cochel, Manhattan, as. Prof. Cochel was formerly at Purdue and is thoroughly familiar with conditions in Indiana. His wide experience in cattle feeding places him in position to speak with authority on the subject. Everyone is invited to attend this meeting.

PROGRAM.

10:30 a. m., President's Address, Maurice Douglas.
10:50 a. m., Results of Experimental Feeding, F. G. King.
11:30 a. m., Inspection of experimental cattle, conducted by J. H. Skinner.
1:15 p. m., Market Outlook, J. T. Alexander. Beef Production in the Corn Belt, W. A. Cochel.

F. G. KING,
Sec'y Indiana Cattle Feeders' Assn.

MISSOURI SHEEP BREEDERS AND FEEDERS COMBINE.

At the meeting of the Missouri Sheep Breeders Association held at Columbia, Mo., the members present voted to reorganize the association, enlarging its field to include the Missouri sheep feeders. A law against dogs, which cause endless trouble to many sheep raisers was ably discussed by Mr. M. V. Carroll of Pettis County, and former secretary of the association. He told of the trouble in getting the former dog laws through the legislature and how it had then been killed in the lower courts, money being lacking to carry it to the Supreme Court. At the business meeting E. B. Wilson of Stanberry, was elected president; J. A. Foote, Casius, vice-president S. W. District; Lyle Atkins of Denton, vice-president N. E. District; T. E. Atkins, Columbia, vice-president Central District; H. Hackedorn, secretary-treasurer.

GOOD OBJECT LESSON IN PIGS.

Six extraordinary hogs were sent to the International Live Stock Exposition at Chicago, last December from the Kansas Agricultural College. They were extraordinary because they were not yet nine months old and averaged nearly 300 pounds apiece. From Auguts 1 to December 1 they have made pork at the rate of nearly two pounds a day. Hog raisers usually think they are doing pretty well when their hogs gain one pound a day. At the price of hogs at that time—about $7.75 a hundred—these six were worth $140. The total cost of rearing them had amount-

A Real 1913 Car

By R. E. Olds, Designer

Here are some things which you should look for in a 1913 car. A car without them lacks things you should have.

New Features

The leading cars of this year have the left-side drive. They have electric dash lights—set-in lights—not the old projecting lamps.

They have oversize tires. Skimpy tires, which double one's tire bills, are quite out-of-date.

All cars, in such things, follow the leaders. So don't get features which the best makers have abandoned.

New Ideals

Then men today are buying cars for keeps. So the best makers now are building cars which will run for years like new. And cars which cut down upkeep.

Reo the Fifth, my latest car, shows what such cars require.

It is built of steel made to formula, and analyzed twice. The gears are tested in a 50-ton crushing machine. The springs are tested for 100,000 vibrations.

Every driving part, as a margin of safety, is given 50 per cent overcapacity.

We use 15 roller bearings, though they cost five times as much as common ball bearings. We use 190 drop forgings to avoid the risk of flaws

We use a $75 magneto, a doubly-heated carburetor, a smokeless oiling system.

We build slowly and carefully—grind parts over and over—watch them through endless inspection.

Each engine is given five long tests, lasting 48 hours altogether.

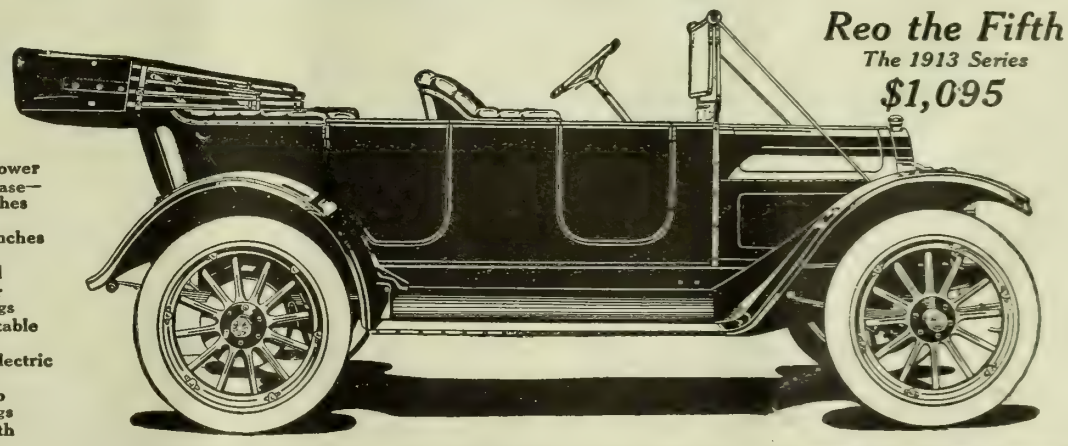
We could save in our building about $200 by using less care and less costly parts. But it would cost you in upkeep, in years to come, several times $200.

So we give you the best we know. Then we save you about 20 per cent on our cost by confining our output to this single model.

Thus we give you a car, built as we describe, at this matchless Reo price.

Rod Control

Reo the Fifth has our new control. All the gear shifting is done with one center rod, entirely out of the way. It is done by moving this rod only three inches in each of four directions.



There are no levers to clog the way of the driver. Both brakes are operated by foot pedals. So the driver enters from either side.

You will want this feature in your car when you see how much it means.

After 26 years spent in car building, Reo the Fifth marks the best I know. If you want the best, please see it.

Write for our catalog and we will direct you to the nearest Reo showroom. They are everywhere.

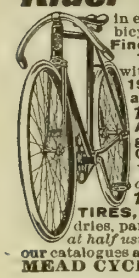
R. M. Owen & Co., General Sales Agents for Reo Motor Car Co., Lansing, Mich.
Canadian Factory, St. Catharines, Ont.

Reo the Fifth
The 1913 Series
$1,095

30-35 Horsepower
Wheel Base—112 inches
Tires—34 x 4 inches
Center Control
15 Roller Bearings
Demountable Rims
Three Electric Lights
190 Drop Forgings
Made with 1 and 2 Passenger Bodies

Top and windshield not included in price. We equip this car with mohair top, side curtains and slip cover, windshield, Prest-o-Lite gas tank for headlights, speedometer, self-starter, extra rim and brackets—all for $100 extra (list price $170).
(Gray & Davis Electric Lighting and Starting System at an extra price, if wanted.)

KEROSENE, GASOLINE AND OIL
To Consumers at Wholesale Prices



NO WATER IN MY KEROSENE OR GASOLINE.

XXX 46 gravity water white kerosene.....$6.00 for 52 gal. bbl.
XX 42 gravity kerosene (the kind usually sold).....$5.25 for 52 gal. bbl.
XXX 64 gravity gasoline. .....$10.00 for 52 gal. bbl.
1 case graphite axle grease (2 doz. 3 pound pails).....$3.50
40 gravity prime white stove distillate .....$4.50 for 52 gal. bbl.
83 gravity stove distillate .....$4.25 for 52 gal. bbl.
60 gallon (26 gauge) galvanized steel tank with pump and hood cover complete—a great convenience in every home.$3.60
Extra heavy pure crude oil, steamed and settled (black oil) good lubricant, just the thing for greasing tools.....$4.00 for 52 gal. bbl.

I will pay $1.25 each for my crude oil barrels, and $1.50 each for refined oil barrels, returned to me at Coffeyville, Kas., in good order, less freight charges on same.

ed to about $90, leaving a profit of $50.

No fancy food was fed. Corn, shorts, and tankage were the principal feeds. They were fed in a ration having these proportions: Corn, 62 per cent; shorts, 30 per cent, and tankage, 8 per cent. This ration varied a little at first when more shorts and less corn was fed. For a while in July and August the hogs got skim milk or buttermilk. Three of the animals were Berkshires and the other three were Duroc Jerseys. The animal husbandry department believes that shows what can be done by the careful feeding of a well-balanced ration.

TO CHECK THE CHINCH BUGS.

To the American Breeder: Seventeen million dollars worth of damages to the wheat, oats, and corn of Kansas, last year, was caused by chinch bugs. At least 90 per cent of the late hatched bugs, according to G. A. Dean, state entomologist at the Kansas Agricultural College, remained alive during the winter and will continue their destructive work this summer. Unless some steps are taken by farmers to safeguard their crops, the loss will be greater than it was last year, Professor Dean says.

Several methods may be used successfully to arrest their migration. These should be put into force before the early crops have matured. After the bugs have once entered the small grain fields there is no way to prevent injury, but it is entirely possible to keep them from passing into the corn, kafir, and sorghum.

The dust barrier and the road-oil barrier are methods commonly used to destroy the bugs. The first is useful in dry weather and the latter when the soil is wet. A dust barrier is made by plowing a strip of ground about ten feet wide between the infested and the non-infested fields and then working this into a fine dust. Two deep parallel furrows are made by dragging with a double trough. A single furrow barrier may be made by listing a deep furrow and then dragging with a heavy log. The bugs fall into these furrows when they pass from one field to another and may be destroyed by a gasoline torch or by dragging a log through the furrows. The torch is more effective.

The road-oil barrier is constructed by plowing a sharp back furrow between the fields and working up a ridge on this by dragging a trough over it. On the bottom of the trough a pole is placed which will leave a groove on top of the compact ridge. No. 7 road-oil is placed in this groove in sufficient quantity to make a line one-half to three-fourths of an inch wide. After the bugs have fallen into the groove they may be destroyed by the gasoline torch. Coal tar can be substituted for road-oil but it is more expensive and must be renewed more frequently. The road-oil barrier is for use in wet weather when the dust barrier is useless. It should be placed between the dust barrier and the non-infested fields.—Charles Dillon, Kansas Agricultural College.

CATTLE MEN TO MEET AT LINCOLN, NEBRASKA.

To the American Breeder:—We are inviting cattle feeders to meet with us on May 29th to inspect the steers which have been on feed during the past winter. At that time a printed sheet will be handed out giving the kind of feed fed, daily gain, cost, and profit or loss. You are cordially invited to have a representative here at that time. Since your paper circulates largely through Nebraska, and since a number of farmers of different states will be interested in this meeting, I trust you will find space to mention it in your paper. Our object in calling this meeting is to bring the cattle feeders of our state into closer touch with the work of the experiment station.

The cattle used in experimental work during the past winter were common range cattle purchased in the Omaha yards the first of last November. The first 45 days, or until December 15th, the steers were fed a light feed of corn along with silage and alfalfa hay for roughage. On December 15th they were put on the following rations:

Lot 1—Corn, prairie hay and cottonseed meal.

Lot 2—Corn, silage and cottonseed meal.

Lot 3—Corn, silage, prairie hay.

Lot 4—Corn, silage heavy, and alfalfa.

Lot 5—Corn, silage medium, and alfalfa.

Lot 6—Corn, alfalfa.

After years of experimenting, the Nebraska station feels certain that on the average and under Nebraska conditions, alfalfa hay furnishes the cheapest source of protein when fed with corn along with limited quantities of corn stover, straw or prairie hay. The advent of silage as a prominent fattening feed raises a question as to the cheapest source of protein when silage forms a considerable part of the ration, and also raises a question as to the right amounts of silage and alfalfa to feed along with corn for best results. The foregoing experiment was planned for the purpose of determining these points. Everyone, whether living in Nebraska or elsewhere, interested in beef production is cordially invited to be present at this meeting.—R. K. Bliss, Dept. of Animal Husbandry, U. of N., Lincoln, Neb.

NEW VOLUME, POLLED DURHAM RECORD.

Volume 5 of the Polled Durham Herd Book is ready for distribution. It shows that something near 2,500 stock men and farmers in the United States are now owners of Polled Durham cattle. Nearly 3,000 bulls are recorded in this particular volume, the first number being 6449 and the last number 9172. This volume sells for $3.00 to everybody with an additional charge for postage, which averages about 25 cents per volume. Address J. H. Mart, Greenville, Ohio.

CARE OF THE YOUNG CALF.

To the American Breeder:—When the calf is dropped, leave it with the dam a few hours, to afford her an opportunity to lick it. If the cow gives milk containing only a medium amount of solids, the calf may be permitted to take what nourishment it wants the first time; but if the cow gives very rich milk, only a little should be allowed; otherwise there is danger of having a bad case of indigestion on your hands the second day. Just at this time much attention should be given the cow by way of grooming; not with a currycomb, but with a brush. Frequent rubbing of the udder will prove beneficial to the cow and profitable to you. After the calf has taken nourishment once, it should be removed, preferably when the dam is not in the stall or pen; for it is better that she should not associate you with the loss of her calf, that she may more readily transfer her affection to you. By removing the calf at once, it is soon forgotten, and thus disturbance is minimized.—T. L. Haecker, Dairy and Animal Husbandry Division, University Farm, St. Paul.

WHEAT PROSPECTS UNUSUALLY GOOD.

To the American Breeder: The Crop Reporting Board of the Bureau of Statistics of the United States Department of Agriculture estimates, from the reports of correspondents and agents of the bureau, as follows:

On May 1 the area of winter wheat to be harvested was about 30,938,000 acres, or 4.5 per cent (1,449,999 acres) less than the area planted last autumn, but 16.4 per cent (4,367,000 acres) more than the area harvested last year, viz. 26,571,000 acres.

The average condition of winter wheat on May 1 was 91.9, compared with 91.6 on April 1, 79.7 on May 1, 1912, and 85.6, the average for the past ten years on May 1.

A condition of 91.9 per cent on May 1 is indicative of a yield per acre of approximately 16.6 bushels, assuming average variations to prevail thereafter. On the estimated area to be harvested, 16.6 bushels per acre would produce 513,571,000 bushels, or 28.4 per cent more than in 1912, 19.3 per cent more than in 1911, and 18.3 per cent more than in 1910. The outturn of the crop will probably be above or below the figures given above according as the change in conditions from May 1 to harvest is above or below the average change.

The average condition of meadow (hay) lands on May 1 was 88.0 compared with 85-7 on May 1, 1912, and a ten-year average on May 1 of 88.5.

Stocks of hay on farms May 1 are estimated as 10,828,000 tons (14.9 per cent of crop), against 4,744,000 tons (8.6 per cent) on May 1, 1912, and 8,673,000 tons (12.6 per cent) on May 1, 1911.

The average condition of pastures on May 1 was 87.1, compared with 81.7 on May 1, 1912, and a ten-year average on May 1 of 86.1.

Of spring plowing 67.2 per cent was completed up to May 1, compared with 52.8 per cent on May 1, 1912, and a ten-year average on May 1 of 65.7.

WHITE'S SHORTHORNS

Good Cattle, Good Breeding, Good Dealing.

Have had a good season's business and stock is sold down to calves.

Inspection invited.

SCOTCH COLLIE PUPS

for sale. Sable and white; from fine working parents. Also the mother of the pups for sale. These will be sold cheap as I want to close them out. Can furnish pedigrees. **Amasa Roberts, Bentonsport, Iowa.**

REAL ESTATE

A CROP EVERY YEAR

A country that will do that, is worth tying to. Plenty of rainfall would make millions of acres in some portions of the country very productive. But where it cannot be depended on, farming is hazardous. The entire line of the KANSAS CITY SOUTHERN RY. runs thorugh the certain rainbelt and if the farmer does his duty, he is sure of a crop. Quit gambling on the climate. Make your home in this region of perpetual crops. The richest virgin soil is waiting for you here at prices you will never again be able to touch. Send today for information about land open for settlement and let the Kansas City Southern start you on the way to fortune. Don't delay visiting the country that will mean better conditions and steady profits for you. Remember—a crop every year!

WM. NICHOLSON,
671 Thayer Bldg., Kansas City, Mo.
Immigration Agent, The Kansas City Southern Railway.

Irrigated Farm Land

With Abundant Water Supply.

Grazing Land (Watered) and Timber for sale in Southwest Colorado. Irrigation facilities here are unexcelled and this has long been Colorado's best live stock section.

Fine, moderate climate; no extremes; tornadoes unknown.

155 acres fine private water right. 2½ miles from Mancos; 30 acres in meadow, timothy and red top. Alfalfa, meadow, grain land, small orchard. Good six room house just been remodeled. Hay barn 40x56. Horse barn, cow sheds, chicken house, shop, granary, ice house, etc. Good fence; $55 per acre; a bargain.

160 acres; good house; barn, cross fences; chicken house; sheds, etc.; four shares in storage system besides fishing in waste water. Four acres in cultivation. New farm; fine land; four acres in orchard; $5,000.

160 acres four miles from town; good small house; barn; fenced; partly under cultivation; fine land; $2,000.

Raw land, agricultural and grazing at $5.00 per acre.

W. L. Morse, Mancos, Colorado.

CATTLEMEN.

British Columbia bunch grass range land. We can locate you on Government land, 21 year lease with option to purchase. Have several ranges with cattle for sale. **The Wright Investment Co., Ltd., 1110 Dominion Bldg., Vancouver, B. C.**

806 ACRE STOCK RANCH

For sale or exchange for other property in Kansas or Missouri; fine agricultural and grass land in Eastern New Mexico; 2 sets of improvements, including good windmills and wells. $10 per acre. For further particulars write **L. F. Williams, Murdock, N. M.**

HAVE RETIRED.

Old, and wish to sell. I will sell you this highly improved stock farm, good buildings; woven wire fencing; 485 acres. Can't be beat. Write **Lock Box 285, Wellington, Kans.**

160 ACRES OF HAY LAND

for sale or trade for pure bred horses; Percherons; mares preferred. Price $20 per acre. **F. D. Maddex, Arcadia, Neb.**

PARTNER WANTED.

OWNER OF FIRST CLASS STOCK RANCH.

Fully equipped, in Southwest Colorado, stocked with Percheron horses, Galloway cattle, Duroc Jersey hogs, besides other stock, desires to sell a half interest to young or middle aged man who has had practical experience in the handling of stock, purchaser to assume active management, $9,500 required, but would carry a part of this if necessary. Sickness the reason for selling.

Three acclimated Percheron stallions for sale, all young and good. Address, **M. F. Laycock, 608 Kansas Ave., Topeka, Kas.**

BARGAINS TO CLOSE OUT

Breeding Stock and Barns.

3 stallions: Two Percherons and one Belgian.

4 jacks: Two good big ones and two jack colts, also two big black jennets, one in foal to Black Cloud.

Will give anybody a good trade and will cut price in two to sell barns and all to one man.

W. E. Long, Roll, Blackford Co., Ind.

LIVERY BARN AND FEED YARD

For sale in New Sharon, Iowa. Write owner, **Homer H. Hull, Ramona, South Dakota.**

Of spring planting 57.0 per cent was completed up to May 1, compared with 48.9 per cent on May 1, 1912, and a seven-year average on May 1 of 54.3.—Victor H. Olmsted, Department of Agriculture, Washington, D. C.

ADJUSTING A SULKY PLOW.

To the American Breeder: A sulky plow properly adjusted should pull but little heavier than a walking plow of the same size. This is possible only when the downward pressure and side pressure of the plow bottom is carried by the wheels. Otherwise the sulky plow must pull the harder because of the additional weight of the frame and driver.

The downward pressure of the plow bottom is loaded upon the wheels by raising the heel of the landside from the bottom of the furrow, which give the sulky more "suction" than the walking plow. Also the heel of the share is not flattened to "give bearing," as is that of the walking plow.

The side pressure of the bottom is loaded upon the wheels by setting the rear furrow wheel outside the landside so as to remove all pressure from the latter. Sometimes the landside is removed entirely. Sharpen your shares (cutting the furrow slice consumes 50 per cent of the draft) and try the above and note the results.—E. W. Hamilton, Idaho Experiment Station.

Infectious Abortion; Mares.

A Specific Germ That Causes Many Mares to Lose Colts. How the Infection Is Spread and How to Prevent it. The Stallion Owner's Part.

To the American Breeder:—I have three good draft mares. No. 1 was bred in May, 1910, and lost her foal in January, 1911; she was bred again in August, 1911, and lost that foal in April, 1912. The first foal was a mule; the second a horse. Number 2 was bred and in about seven months she lost her foal; I bred her again and in about seven months she lost that foal. Number 3 was bred and lost her foal at about five months. Now, these mares were all in condition and had not been pulled hard. Is there such a disease as contageous abortion? What is the cause of it? Is there any cure for it? Would there be any use to breed these mares again? Is there anything to prevent them from throwing the foals again? Number two and number three are young mares just coming seven years old.—Missouri Subscriber.

The above is only one of the many inquiries received by the American Breeder which impresses us that infectious abortion is increasing among mares. This disease is becoming a growing menace to the horse breeding industry, and it comes within the mission of this paper to acquaint breeders with the nature of the disease as well as point out the necessary course to pursue to avoid as well as to eradicate it from the premises.

In the first place it has been quite conclusively proven that infectious abortion is dependent for its existence upon certain microorganisms, i. e., germs. Experiments have been carried out by injecting the cultures of these germs into the body, by feeding them and by placing the discharges from a subject into the vaginal canal, and in these cases an abortion was produced. Further examinations disclosed the same class of germs in the body of the dead foetus. It would appear then that all of the vaginal discharges from a mare that had aborted, should be regarded as a source of danger and that where a mare that has aborted is permitted to mingle with other pregnant mares, that she is sure to contaminate the food by means of her discharges, and thus rapidly spread the disease to others. In addition to this, there is the occasional case resulting from actual contact.

No doubt one of the chief ways in which this disease is disseminated is through the stallion. Owners who are ignorant of the nature of this disease, bring their mares to the stallion early in the season. There are several reasons that make this quite the natural thing to do. In this way stallions become infected early in the season and when such occurs, there is sure to be an increased crop of abortion cases another year. At the time the mare is presented for service, it is not easy to recognize her as a mare that has aborted, and the stallion owner has to depend largely upon the word of the mare owner, which may, in some cases, be misleading, should the latter fear the stallion owner may refuse to breed his mare.

The chief symptom that distinguishes the infectious case from the mare that aborts from accident is that the former is preceded by two or three days' warning in the way of a noticeable vaginal discharge. This discharge persists for several weeks after the act, and it must be remembered that this discharge teems with the germs responsible for the disease.

One of the very necessary steps to take in controlling an outbreak is to promptly separate any affected animal from the balance of the herd. She should by all means be kept restricted so that she will not spread the disease over the premises. The foetus and all soiled bedding should be carefully removed and burned. In the case of a mare aborting in a lot or pasture the ground should be burned over slowly by making use of old hay or straw.

One individual should be assigned the task of caring for such cases and under no circumstances should he be amongst the other stock. The disease organisms may be carried on one's shoes. The patient should be given a thorough course of disinfection by means of daily irrigations of the genital tract, beginning three days after the abortion. For this purpose an elevated container that will hold two or three gallons of fluid may be used. To this should be attached eight or ten feet of one-half inch soft rubber hose. A one-half of one per cent lysol solution is very effective and the drug should be added to clean water that has been boiled for 20 minutes. When irrigating, the water where it emerges from the end of the hose should be 105 degrees Fahrenheit. Both the vagina and uterus should be irrigated and the fluid carefully siphoned out as the task is finished. It is always in order under these circumstances to call in a competent veterinarian that a rigid system may be installed for a prompt suppression of the disease and that the affected animals may be promptly cleaned up so as to lessen the danger of spread from that source. The man who neg-

(Stallion Service Books 10c)

lects, is indifferent, and procrastinates, will pay heavily in these outbreaks if he is the owner of several valuable mares. The most difficult phase of the subject to handle is the class of mares that were infected at the time of service from a previously infected stallion. These cases make the task of control difficult in proportion to the number diseased. In some cases the entire lot is contaminated from a common source.

The germ of abortion is persistent and continues after once gaining access to the genital tract for two and even three years. It is not uncommon for a mare to abort for two years in succession and then conceive and continue afterwards as a regular breeder. We are led to conclude that in such cases the mare has either developed sufficient resistance to overcome the germ, or that the latter has in time become less virulent so it is no longer able to provoke abortion.

The eradication of abortion lies largely with the stallion owner. He should make a special study of the conditions existing in his neighborhood and be an educator among mare owners. He should acquaint mare owners with the dangers of the disease and the wrong that comes from wanting to breed an aborting mare to any stallion, particularly a stallion that is standng for the general public. The mare owner should be taught that it is foolhardy to offer to breed his mare until she has been properly treated and made sound, for not to do so only signifies a repetition of abortion and a further dissemination of the disease. These mares when bred should always be bred with a capsule from a standpoint of safety to the stallion if nothing else. If this system is carefully and faithfully followed, we are satisfied that this, the great source of its spread, will be cut short (through the stallion) and that the occasional case that develops from other causes can be successfully controlled.

We are going to ask that the stallion owners be on the alert this year and make the suppression of infectious abortion a part of their work.

A SHORT TAILED COLT.

To the American Breeder:—In regard to Ohio Subscriber's inquiry about a short tailed colt, will say that a company of us bought an imported Percheron horse February 10, 1912, from C. W. Lamer, Salina, Kas., and this horse has put out one short tailed colt. This mare is a grade, about three-fourths pony. This mare had been bred two or three seasons, but did not get in foal. I opened her up and she caught the first service. The tail bone is one-half shorter than it should be, but there is hair on the end. If Ohio Subscriber's horse has hair on the end of the bone, I would claim that it was born that way, but if there is no hair some one has surely used a knife. —Western Oklahoma Subscriber.

ADVISES MARE OWNERS TO READ IT.

To the American Breeder:—Your paper at hand. I always read every word in it. I think if the mare owners would take a little more time and study breeding there would be lots more satisfied breeders in this country. I have traveled stallions for the last ten years and don't think I know it half, but what I am going to write may help some new beginners in the horse breeding business. I read a piece in the last issue of a pony stallion refusing to cover a mare on account of a hard drive, as he claims. I have had different horses refuse mares lots of times and the horses were in pink of shape. Real often I have had the mare owners tell me "you have overdone your horse." But as a rule, I scare up another mare and the horse is prime on sight of the mare if she is anywhere near in heat, and I have often switched mares on the horse and then bred the mare the horse refused to have a thing to do with in the first place. I also broke a horse of leaving a mare too soon by simply holding him on a few times. Two men can hold a horse on a mare. I never hold a horse unless he quits too soon. I believe in letting a horse make a cover as easy as possible and letting him have a good look at her when finished. I have traveled draft horses mostly and all I wish is that I could make my patrons take the American Breeder and read up a little on breeding. I have a good business with my horses and get as many colts as the average natural breeder. I am going to try the capsule system, but I expect I will have to give away a colt or two at first.—H. R. Miller, Monroe County, Wis.

A NOVEL ADVERTISEMENT.

The advertising problem is one which puzzles many horse breeders more than the actual work of making a successful season with their breeding stock, and we have many times discussed advertising methods and asked for suggestions from those who had tried out successful plans. Study the advertisement printed below which we clipped from the Times-Democrat, Flemingsburg, Ky.:

Village Stock Farm.

J. W. SHOCKLEY, Prop.

Ewing, Ky., May 9, 1913.

"Hello, there! Is this J. W. Shockley?"

'Yes, sir; get out and come in."

"I wish to look at your stock."

"All right; we will look at the saddle horse first, he is 5 gaited, 4 years old, steps clean and swift, easy under the saddle, lady can ride or drive him. We call him Rex McDonald Jr. The blood that courses his veins is from such noted sires as Rex Denmark, Rex McDonald, Harrison Chief, Montrose Chief, Grey Eagle, Davie Crockett, Joe McClelland, Bourbon Chief, Old Red Cloud, Indian Chief, etc."

"Well, you have a model horse. I will tell the boys about him."

"Next, comes Barron Ideal, a pure bred Clydesdale, the up-to-date draft horse of the future, combining size, substance and perfect action, for which this breed has long been famous the world over. The Clydesdale is the handsomest, strongest, most enduring and intelligent draft horse in existence. His production is no haphazard results; his pedigree is pure and unchallenged. No breed has won half so many honors in open competition. Here comes Bourbon Boy! He too, is of the draft type; his colts are on every adjoining farm; they can speak for themselves.

"Now, let's go down and I will show you the jacks. This one is Deacon the Great. His colts have sold for $200 at weaning time and he has them this year that will do the same. Next comes Deacon Jr. Many say that he is a better individual than his sire. I can soon show his colts. Over in that stall is the least and yet the greatest of all, a pure bred Shetland. We call him 'Roscoe.' He, too, has colts to show for themselves. Now, sit down and tell me, have you ever seen a barn of stock as good, where each individual is as perfectly sound as these?

"Well, sir; I will be pleased to do business with you and will tell you how you will be treated, just as the other fellow, rich and poor all look alike to me. My prices are $10 to stand and suck, except the Clydesdale; he at $10 and $15.

"I will insure capsule colts for six months.

"What about the capsules? Don't ask me, go ask Gano Hendrix, Billy Hurst, Robt. Talley, John Lukins, John Jones, Henry Stout, E. C. May, Robt. Yancey, Guy Hawley, Tom Mason, and a number of others I can not call to mind.

"My hours for breeding will be 3 p. m. each day, at which time I can breed a reasonable number of mares. Now, before leaving, there is one request I will make of every one; if you are in the habit of swearing or telling vulgar stories just leave that off while at my barn, for I will not permit it.

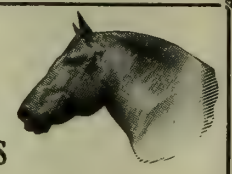
"Say, wish you had time I would like to show you the Jerseys, Shropshire sheep and Poland Chinas. Will do that when you come back.

"Come again."

Yours truly,
J. W. SHOCKLEY, Ewing, Ky.

W. A. LANG & CO.

Greeley, Delaware County, Iowa



Importers of BELGIAN and PERCHERON STALLIONS AND MARES.

We wish to announce to the buying public that we will now, as in the past, give you more good, sound, young horses for the money than you can get elsewhere. We do not advertise cheap stock because we do not think the best breeders want that kind, but we will sell you the good ones at as reasonable margin of profit as possible and do a remunerative business. All horses are backed up by our GILT EDGE GUARANTEE. Write for full particulars, mentioning this paper.

Four Clydesdales and one Percheron coming two years old; all big fellows with plenty of bone and quality. John H. Chambers. Edinburg, Johnson County, Indiana.

FOR MORE INFORMATION ON BELGIANS.

To the American Breeder:—In your issue of February 20, discussing improvements in horse breeds, you say that the Belgian breeders are beginning to see the necessity of making a few minor changes to accommodate the American and Argentine markets. Will you please be kind enough to tell me what changes you want to be brought in the conformation of the Belgian draft horse and the reason why those changes should be made? I like to discuss such matters because it is the only way to know what to do. I concede that the Belgian draft horse is perhaps not the best draft horse, as no breed so far is perfect, but before we undertake a change I would like to know good reasons for doing it. In very old breeds, like the Belgian breed, a change is very hard to get, because there is a great uniformity in the breed. If a change must be made, we must have some good reasons for trying to perpetuate it in the breed. Your paper is a good paper—a very interesting paper—and to my belief the best breeder's paper in this country. I am doing my best to spread its reading in my neighborhood. This is a scientific paper and an impartial paper toward all horse breeds. In a few weeks I am going to Europe for a vacation and I will be glad to send you information about horses that I will see there.—Leon van Meldert, Harris County, Texas.

We hope to have several communications from Mr. Van Meldert while he is in Europe, and believe they will be both instructive and entertaining to our readers. We hope he will take special note of the type of stallions the Belgian government is "pensioning" and give us his ideas as to how this type meets our needs and as to what this country, or the agricultural organizations of this country, could best do to provide similar aid and support to our own breeders of draft horses—Belgians in particular. This policy of the Belgian government makes it cost our importers a good deal of money to bring over the best horses. If we are to get more of the best ones, and in that way hasten the improvements to which we referred, our buyers will need education as to their worth, and as to means of making the more expensive ones profitable. With the help of Mr. Van Meldert and others who have a chance to study conditions on both

JACKS AND MULES

We have 14 jacks from one to six years old; have lots of bone, size and quality; all black with white points.

Also have 128 yearling mules, coming two year old, and 26 mule colts. These mules are from grade draft mares; have lots of bone and width. Only 15 out of the 154 are horse mules, the balance are mare mules. Will sell at reasonable prices. Scott, Abney & Jenkins, Virden, Macoupin County, Ill.

JACKS AND JENNETS.

Forty head of Mammoth jacks and jennets for sale. Jacks in age from colts to four years old; in size up to 16 hands. These jacks are all good ones; in this lot are two as good as grows—good enough to head any herd of jennets. I have one of the best herds of jennets in Kentucky. I raise all my own stock and will sell them worth the money. Write for prices today, or better, come and see them. **U. G. Saunders, Flemingsburg, Ky.**

16 **SEE HERE.** 16

For sale: 7 black jacks from 3 years to 5 years old; all sound; prompt performers on mares; 15 to 16 hands. Three of them weigh over 1100 pounds each. 8 black Mammoth jennets, 14½ to 15½ hands high. One black Percheron stallion. His number is 11839; will make a 2100 lb. horse.

All cheap for cash or will trade for land within 100 miles of K. C.

W. W. Shott, Lathrop, Mo.

JACK AND STALLIONS

For sale. The jack is Brillador, by Brigadier, sire of the Champion jack at the State Fair at Dallas last year. Brillador is 15.3 hands high; coming four years; weighs 1100 pounds; plenty of style, and fully guaranteed.

I have two draft stallions and one standard bred, and want to sell one of the draft. One is a big bay Percheron, fourts price at Dallac Fair, 1910; the other a rangy, 1500 pound horse. **McLaughlin Ranch, Water Valley, Tex.**

FAIRVIEW JACK AND JENNET FARM

32 Jacks and 35 Jennets, the best that grow, 14½ to 16½ hands high—jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address

J. C. HUCKSTEP,
Eolia, Pike County, Mo.

GRANDVIEW JACK FARM.

Two Big Mammoth Jacks

for sale July 1st; 15 and 15½ hands high, or will trade one for a jennet spoiled jack if a good one. Mine both guaranteed breeders and performers.

John W. Carolan, Booneville, Ark., Route No. 3.

TWO BLACK JACKS

for sale. Six and eight years old; good breeders. One 64 inches high; 70 inches heart girth; 9½ inch shin. Price $600. The other 61 inches high; 64 inch girth; 7¼ inch shin; blocky built. Price $400. Either one of these jacks will pay for themselves in a single season if rightly handled. Good terms to good parties. No trades. **G. T. Poage, Garrison, Mo.**

JACKS.

20 good black jacks and some good jennets; coming 3 to coming 8 years old. Large, heavy boned, broken to mares and prompt servers. Prices reasonable. Come and see me. Barns 2 miles from town.

Phil Walker, Moline, Elk County, Kas.

SAYS SLOW JACKS CAN SIRE FAST ONES.

The the American Breeder:—I beg to differ with T. E. Collins of Republic county, Kansas, in regard to slow jacks, as I have had considerable to do with slow jacks. I raised six jack colts all from a slow jack that would not work without a jennet and they all have made good, quick servers. So I always try to find the jack that has the quality and breed to him—R. N. Leigh, St. Francois County, Mo.

ANOTHER BIG JACK FROM INDIANA.

To the American Breeder:—In March 20 issue I see there were a number of young jacks measured. I would like to give mine, realizing he isn't the best. Whaler is 30 months and eight days old; height 16 hands standard; length 7 feet, five inches; heart 69½ inches; flank 71 inches; head 31½ inches; ear 35 inches; muzzle 21½ inches; arm 23 inches; knee 16 inches; cannon 9 inches; hock 20 inches; above hock 16 inches; below hock 10 inches. He is thin in flesh; dark with white points; is jennet's first colt.—Rufus W. Bass, Pike County, Ind.

HORSE AND MULE TWINS.

To the American Breeder:—You were asking about mares having twins. Last spring a year ago, my mare had twins, one mule and one horse colt. She was served by my jack first and three weeks later I served her with my horse. She settled from both services, but only carried the colts nine and a half months as she got in a runaway. Some of my neighbors saw this freak. Those that did not were hard to make believe. If I had used the capsule on this mare it would have solved the mystery, as I might have got things mixed, as we graduates get in a hurry sometimes. Unbelievers will find it profitable to attend the Graham Breeding School and things will be made plain.—J. A. Craft, Pottawattomie County, Iowa.

ADVERISING BRIEFS.

John W. Carolan of Boonville, Ark., has two Mammoth jacks advertised for sale in this issue. If interested, read the ad.

Anyone in the market for a saddle stallion should look up the advertisement in this issue of "Box X," Wheatland Mo., and write for further information.

The McLaughlin Ranch, Water Valley, Texas, is advertising a jack and stallion for sale in this issue. Look up the ad.

Read the bargains advertised in this issue by W. E. Long, Roll, Ind., and then write for further information.

Among the many testimonial letters received by the makers of Absorbine is the following from Wm. Powell, West Concord, N. H., under date of Sept. 15, 1912: "I want to make some inquiries and tell you some of my experiences with your Absorbine as I became a user of the same about six or seven years ago and among a number of other remedies, I have found none its equal. About six years ago, I bought a mare that had bumped her knee and raised a bunch as large as my fist and with the use of Absorbine I brought her sound. I kept her about a year and she was taken with paralysis of the hind quarters. The neighbors said I would have to kill her. She was so bad off that she could not stand and I thought myself that she would die, but with your treatment I brought her out of it safe and sound. I have used Absorbine on myself. One thing was a sprained ankle which was a bad one, but with the use of Absorbine was able to walk again in two days. Last April, I bought a young horse with a bunch on its knee, which I reduced to nearly natural with one bottle of the liniment." The makers of Absorbine (who advertise regularly in the American Breeder), are W. F. Young, P.D.F., 388 Temple St., Springfield, Mass.

J. C. Robison's Percheron sale, May 21, will include: 25 imported yearling stallions and fillies, blacks and dark grays, and all acclimated; 5 American bred stallions and fillies (yearlings). Some sired by Casino; ton mares with colt by side and bred again to Casino; imported mares with colt by side and bred to Casino; 10 young stallions old enough for service; yearling filly sired by Imprecation, champion at Chicago, 1911 and 1912 (probably the only filly by Imprecation for sale in America). Also yearling filly by Intitule. He was selected to represent the Percheron breed at the Olympic at London last year, and was the highest priced Percheron stallion imported to America last year; yearling stallions and fillies by Sons of Eteudiant and Fies A. Bras. Never was a chance offered before in America to secure such blood. Mares bred to Casino and colts sired by him. Ton mares well broken to harness. Cleanest offering ever made from this farm. Sale at farm. Free conveyance to farm from Towanda. Send at once for catalog and mention the American Breeder.

Just as soon as President Wilson gets firmly settled in the White House, arranges for credit at the various stores, receives a cow as a gift (which he will name after the donor), he will dig out his bicycle and begin his famous-to-be-rides through the city of Washington. For President Wilson is very fond of his bicycle and it is expected of him to put bicycling back into the favor it was in the '90s. If you want to know how we found out about this address the Mead Cycle Company at Chicago, Department 23, for a copy of their 1913 catalog.

C. H. White, the breeder of Shorthorn cattle, at Burlington, Kansas, writes that the calves sired by his Shorthorn bull, Richelieu, are proving exceptionally good and that there is a demand for both bulls and heifers as fast as they are old enough to sell. Mr. White will sell a few cows in calf to Richelieu.

Any one wanting a pair of matched registered Percheron filly colts should look up the advertisement in this issue of O. E. Fulghum, Richmond, Ind., and then write for full particulars.

G. T. Poage of Garrison, Mo., has two black jacks advertised for sale in this issue at $400 and $600 each. Read the ad.

If you have a good Percheron stallion that you would like to exchange for 44 acres of land, read the advertisement in this issue of N. A. Schwald, Maxwell, New Mex.

A highly improved stock farm of 485 acres is advertised for sale in this issue. For full particulars write "Lock Box 285," Wellington, Kas.

Any one in the market for a man to handle the capsule system of breeding, should write to Box 166, Columbia, Mo. Read the ad. in this issue.

Dr. P. L. Benthack of Platte Center, Neb., is advertising his Percherons for sale. A change in business makes it necessary for him to dispose of this stock. Look up the ad.

Any one in the market for prize

Ad Brought 110 Letters.

To the American Breeder:—I had splendid results from my large ad. in the American Breeder, Feb. 5 and 20. I only wish I could have had enough aged jacks to have gone around to all who answered the ad. or came to my place, for I received 110 letters in answer to my ad. I still have some young jacks to use this year, so I herewith send 50 cents to pay for one Stallion Service Book.—G. B. Weaver, Cass County, Mo.

300 head of Colorado raised Jacks, Jennets, Mules and Brood Mares. All guaranteed. Prices right. Lewis Swink & Son, Rocky Ford, Otero County, Colorado.

KENTUCKY JACK FARM
Established in 1884.

A fine lot of black Mammoth Kentucky jacks. Big bone and plenty of weight. Will sell at special prices in order to make room for young stock. We sell more jacks to the Western trade than any breeder in Kentucky. Write for prices or come and see us. Guarantee to please our customers. **Joe E. Wright, Junction City, Ky.**

EIGHT JACKS FOR SALE.

Combining the blood of Autar, Black Giant and Lime Stone Wonder; all black, white points.

Have either a trotting or a coach stallion for sale or will trade for a good Percheron mare or jennets. Must be a good one. These horses are sound and the very best of breeders, but have one too many. **Chas. Wyatt, Petersburg, Pike County, Ind.**

JACKS AND STALLIONS

I can furnish a few extra good registered jacks and jennets, also a few choice draft stallions, for less money than any one. L. Donaldson, Olney, Lincoln County, Mo.

Jennets Wanted.

I want several big black aged jennets or colts.

E. E. LAUGHLIN,
Rich Hill, Bates Co., Mo. Route 1.

SADDLERS, MORGANS, STANDARD BRED AND PONIES.

$600 BUYS

The Rex Denmark—Black Squirrel bred saddle stallion, REX KNOX 3115. Black; 15.2; five years; sound. A great acting show horse and sire. Fearless under saddle and in harness.

Also the ladies' beautiful saddle mare MANCELONA II. Bay; 15.1; four years; sound; eligible to registration; safety city broken to saddle and harness and suckling fine foal by Rex Knox. Destruction of my barns by fire makes this sacrifice imperative. **W. T. Wilkinson, Eureka, St. Louis County, Missouri.**

21 HIGH CLASS STALLIONS

For sale at low prices for quality of stock. Eight saddlers, five trotters and eight Shetland ponies; royally bred and grand individuals—many of them prize winners in strong competition. For prices and full description, address **Barbee Stock Farm, Monticello, Drew County, Ark.**

REGISTERED MORGAN HORSES.

My Morgans ars large; 15 to 16 hands and 1050 to 1300 pounds; have clean, heavy bone and possess all of the style and endurance for which the breed is noted.

For Sale—Weanlings to 3-year-olds. by The Admiral 4871 A. M. R., he by Jubilee De Jarnett. Send for catalog. **Richard Sellman, Rochelle, McCulloch County, Texas.**

STANDARD BRED AND REGISTERED

Trotting stallions for sale. Also young jacks and jennets as large as they grow anywhere. I guarantee them to be right. Come and see them. **Henry Obermann, Freistatt, Lawrence County, Missouri.**

EXCELSIOR SHETLAND PONY FARM.

Registered stock a specialty; a limited number for sale. W. H. Fulcomer, Prop., Belleville, Republic Co., Kas.

SADDLERS FOR SALE.

Thirty head of high class stallions at very low prices for next 30 days. Also services of Foss McDonald. Eastern Cloud and others. **H. A. Greenwell, Lakenan, Monroe County, Mo.**

winning stock should not fail to read the advertisement in this issue of E. A. Silverthorne, Rossville, Ind.

Amasa Roberts of Bentonsport, Iowa, has some Scotch Collie pups advertised for sale in this issue. Mr. Roberts says he will sell these dogs cheap in order to close them out. If interested, write him.

M. B. Cate, Dunlap, Mo., is advertising his English Shire stallion, Stuntney Domino, for sale in this issue. If interested, look up the ad.

Read the advertisement in this issue of W. W. Shott, Lathrop, Mo. He is advertising seven jacks, eight jennets and a Percheron stallion for sale, or will trade for land.

On our page devoted to school advertising will be found an announcement of the Jones National School of Auctioneering, No. 1 North Sacramento Blvd., Chicago, Ill. Colonel Carey Jones, at the head of this school, is one of America's most successful auctioneers, and the school is an old established institution.

Intestinal parasites appear to be at the bottom of several of the disorders discussed in our Question and Answer Department for this issue. If every owner of live stock begins now and makes a successful fight against what is generally known as "worm" trouble, he is in shape to get full benefit from the season's pasturage and feed, otherwise he is not. A remedy that has become standard for use in such cases is known as "Sal Vet" and is advertised regularly in this paper. The S. R. Feil Company, Cleveland, Ohio, owners of this remedy, offer it on terms which makes the buyer absolutely safe. We hope no reader will hesitate about getting Sal Vet at once and use it according to directions.

Please notice the new advertisement of "Absorbine," a standard remedy known and advertised all over this continent.

We have never seen a road grader or barnyard scraper so universally useful as the one manufactured by D. B. Gunn, Red Oak, Iowa. This machine has been advertised in the American Breeder for three or four years. It is sold on a guarantee of 15 days' trial and we have yet to hear of the first complaint. The machine has been improved and kept up to date and we consider it the best value on the market in this line.

Many of our readers are interested in veterinary colleges, so we call attention to the two now advertising in our columns. See the school page. These schools are the Kansas City Veterinary College, 1336A East 15th St., and the Terre Haute Veterinary College, Terre Haute, Ind.

A safe remedy and one that is effective in many more cases than the inexperienced would expect, is known everywhere among horse men as "Spohn's." Its full name is Spohn's Distemper & Cough Remedy, manufactured by the Spohn Medical Company, Goshen, Ind. This remedy is advertised in every issue of the American Breeder, and we ask our readers always to mention this paper when ordering it or making inquiries concerning it.

You can get any kind of a fence you want from the Up To Date Mfg. Co., 990 10th St., Terre Haute, Ind. This company sells direct to the buyer at manufacturer's prices. Send for catalogue.

In the gate line we believe we are advertising the best propositions on the market in the line of lumber gates and all steel gates respectively. The lumber gate is made with steel braces and stays and is known as the "Can't Sag." The maker is The Rowe Mfg. Co., 616 Adams St., Galesburg, Ill. The all steel gate is known as the "American" and is manufactured by the American Farm Gate Company, 1457 Elmwood Ave., Kansas City, Mo. One of the largest railway systems in the west now buys all its right of way gates of the American Farm Gate Company. We advise sending for this company's catalogue and guarantee.

The Kansas City Southern Railway from Kansas City to the Gulf of Mexico, traverses a region of rich soil and certain rain fall. There is the least possible hazard in farming along this line, and its immigration department, in Charge of Wm. Nicholson, 671 Thayer Bldg., Kansas City, Mo., is offering at all times bargains in land values. Mention the American Breeder when writing him.

A fine proposition for cattle men is being offered in our advertising columns by the Wright Investment Co., Ltd., 1110 Dominion Bldg., Vancouver, B. C.

A remarkably good opportunity for getting started right in the auctioneer business is offered in the advertisement of W. B. Carpenter, President of the Missouri Auction School, 14th & Grand Avenue, Kansas City, Mo. The fact is well known that the auctioneer business pays better than any other profession considering the time necessary for preparation. The only question is that of equipping one's self for the work and certainly Colonel Carpenter is offering a method which no man can afford to overlook.

Homer H. Hull of Ramona, So. Dak., is advertising in this issue a livery barn and feed yard for sale in New Sharon, Iowa.

CRUSHED OATS

ARE FAR BETTER FOR HORSES and cattle than ground feed. Get a **"NATIONAL"** Oat Crusher. Up-to-date stock farms are rapidly adopting crushed feed. Hand and power sizes. Send for catalog. Agents wanted.

W. R. BELLOWS CO.,
97 Warren St., New York.

HORSE HEALTH ABOVE THE AVERAGE.

A bulletin from the U. S. Department of Agriculture gives the losses of farm horses and mules from disease during the past year are estimated to be about 22.6 per thousand, which compares with 21.9 similarly estimated a year ago. If the estimated loss of 22.6 per thousand be applied to the numbers and values of horses and mules on farms January 1, it would indicate a total loss of approximately 564,000 head, at $113.15 per head, or a total of $63,817,000.

The condition, as to healthfulness, of horses and mules on April 1, 1913, is estimated as 96.7 per cent of normal, which compares with 93.7 similarly estimated a year ago and about 95.8, the ten-year average.

COUNTRY MULE SALE BRINGS $900

Woodson McCoy, who lives in the country 20 miles out from Kansas City, took in over $9,000 on his annual spring sale of mules this year. In this sale a coming two-year-old mule brought $270, a team, same age, brought $497.50, and several teams sold at $400 and up. Fifty mules in all, were sold.

QUESTIONS AND ANSWERS.

(Continued from page 5.)

after the sun warms up; they should be dried with soft rags.

HEAT PERIOD NOT NOTICEABLE—I have a friend that is breeding to my jack and horse and he has a mare that is nine years old and she has never had a colt, nor we have never been able to catch her in heat. We have watched her closely for three years. What can we do with her? She is a fine mare and he is very anxious to get a colt from her.—Oklahoma Subscriber.

REPLY—Breed this mare with a capsule the first time she comes to your barn and send her home.

CLOSED CERVIX—I would like to know if there is any hopes of this mare. She is five years old; repeatedly comes back, taking irregularly and on examination found the neck of uterus hard as a gristle; all parts around it hard. She never foaled.—Oklahoma Subscriber.

REPLY—You cannot expect to have any results with this mare without some assistance; but she may be bred with a capsule with good results if there is no other difficulty.

NAVEL INFECTION—Will you kindly tell me what treatment to use for navel infection in mares? I have a colt affected with that trouble and have had a veterinarian treat it, but with no effect.—Nebraska Subscriber.

REPLY—Get a good qualified veterinarian as soon as the colt shows any symptoms of having infection. We cannot prescribe treatment for colts that are infected. They nearly always die even when the best veterinarians are present to administer. Our readers cannot expect us to help them much in a case of this kind. The best method we know of is to prevent the disease. We have prepared a navel powder that will prevent this if used in time, but it must be used before infection takes place, as it is not meant as a curative agent; it only prevents infection by drying up the navel cord. This preparation is dusted on the navel cord as soon as possible after the colt is born. It should be used two or three times a day for two or three days or until the navel cord is dried up. It is put up in tin cans similar to a pepper box so it can be dusted on the navel cord without much waste. The price of this navel powder is 50 cents a can (one can should save a dozen colts) and can be purchased from the American Breeder.

DISEASED MARE—I have been treating an infected mare that is also a shy breeder. I gave her three treatments of iodine. She seems to be in good condition now, but continues to be in heat. Would you advise that I breed this mare any time soon?—Kansas Subscriber.

REPLY—Since you have used so much iodine we would advise letting her go over until fall.

COW BREEDING WITH CAPSULES—I am interested in your capsule system of breeding, and should like to know if it has been used with cattle to any degree and with what success. Could it be used in breeding cows as a means of preventing the introduction of contagious diseases into the home herd? We have bred cows for the farmers hereabouts for a great many years, and are now forced to discontinue so doing on account of the appearance of contageous abortion in the neighborhood, and the consequent danger of introducing it into our own herd. Might it not be practical to continue this service by this system without danger to our own herd?—Wisconsin Subscriber.

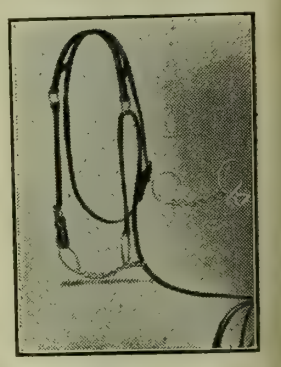
REPLY—We will be glad to have

GET A SPECULUM

if you want to know the condition of a mare's genital tract and whether or not it is diseased. A Speculum is also the only means of examining the cervix to make sure if a mare is in foal. Many an abortion has been caused which the use of the Speculum would have avoided.

This Speculum is made of good material, nickel plated, and with proper care will last a life-time. **SENT POSTPAID FOR $3.00.**

THE KANSAS CITY IMPREGNATOR CO.



12th and Central Sts., Kansas City, Mo.

Johnson Automatic Stallion Bridle

(Patent Applied for Nov. 10, 1909.)

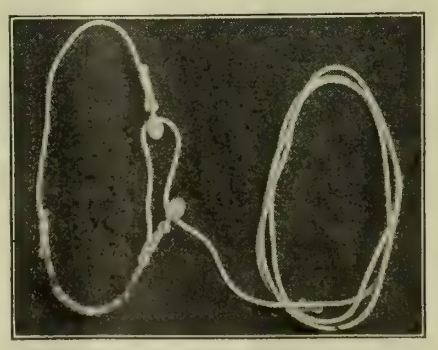
Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.

"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning, Jr., at once. Send by mail. —Val. Thomas, Jr., Hopedale, Ill."



"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one.—E. A. Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not not use with a chain under his jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he can not say too much for it.—De Mott & Son, Scottsbluff, Neb."

PETER YOUNG

Assumption, Christian County, Illinois.

"CONQUEROR" STALLION BRIDLE

GUARANTEED TO HOLD ANY STALLION OR JACK.

This bridle is made of especially selected material, absolutely the best on the market.

Can be adjusted to fit any size head and for either hard or tender mouths

Just the thing for breaking runaways or kickers.

Never tie an animal with this bridle. If he got to pulling he could split his head.

We prepay the postage or express charges and sell these bridles at **$2.50 each.**

KANSAS CITY IMPREGNATOR CO.,
12th & Central Sts., Kansas City, Mo

PERCHERONS TO BE DISPERSED.
A change in business makes it necessary for me to dispose of my Percherons. I have a 5 year old stallion by Tremont 33647, dam Suzanne 17340. I have some mares 3 years old and in foal. These mares combine size with quality and action; some weighing a ton. Mares sired by Nicholas 21997 (43394) and out of good mares. These horses are all of G. L. Carlson's breeding. It is worth your while to come and see this stock. **Dr. P. L. Benthack, Platte Center, Neb.**

our readers give their experiences on this subject.

INFLUENZA—STALLION—My nine years old Belgian stallion never fails to make a good cover, but the spermatozoa are not very active; some not at all, and some only feebly active. Last year he covered 100 mares and was not very sure; only got twenty-five per cent of foals. He had influenza in the middle of the season and was not used for two or three weeks. So far this year I have covered 24 mares and they are coming back for second cover. Make two covers a day. This horse is fed mixed timothy and clover hay and about six quarts of oats and bran mixed. He has a 16-foot box stall with slatted open doors and has been exercised at work a few hours a day, three days a week. Could lack of sunshine be a potent factor in this case?—Ohio Subscriber.

REPLY—Withdraw your stallion from the work he has been doing and give him more violent exercise provided his wind is good. Gradually diminish the roughness and increase the oats. Every morning give this horse a good strong gallop beginning with a quarter of a mile the first morning and increase each morning 100 yards until this horse can gallop a good, strong mile. After the gallop bring him into the barn as quickly as possible and scrape him, the same as race horse men scrape their prospects. In other words, give this horse practically the same training that a running horse should get which was being prepared to run a fast quarter dash. After the horse has been scraped rub him dry with clean woolen cloths, after which a heavy blanket should be thrown over him and he should be walked slowly until he is thoroughly cool. Every Saturday night give him a good hot bran mash. Never allow this stallion to make a service for three hours after having this exercise. Limit him to one service a day until better results are obtained. Feed a teaspoonful of salt in the feed once or twice a day. The semen should be tested at every service. We believe this will open your stallion up so he will give you better results.

GOVERNMENT STALLIONS—I am breeding saddle horses and saw in one of your American Breeders an article on how the government was putting out stallions in different sections of the country for the betterment of this breed. Could you give me any information how I could find out and how to get some of this benefit?—South Dakota Subscriber.

REPLY—Write to Geo. M. Rommell, Bureau of Animal Industry, Washington, D. C.

SHY BELGIAN STALLION—I have a Belgian stallion—over a ton horse. He is very fat; is a quiet server and very gentle to handle. I have bred about 30 mares to him and they come back a horsing every 21 days. Over half of them. I bred several mares with nine day colts as much as three times this season. The weather has been very cool and the mares mostly were put to hard work right away. Do you think that would keep the mares from getting in foal? or do you think the horse's semen is dead? If so, what could I do to make him breed all right? I tease with him at nine a. m. and five p. m. each day when I breed; he always gets ready when teasing. I feed him fine timothy hay and oats and bran, and a little corn with this sometimes. He has about a half acre lot to run in each day and I ride him about one hour every day for exercise. He is five years old this spring. Sometimes he loses semen when he dismounts and sometimes he does not. I have never tested his semen. Could I change his feed to help him, or what could I do for him if his semen is not alive?—Missouri Subscriber.

REPLY—Gradually increase the exercise but do not reduce the flesh. Be careful that you are not breeding any diseased mares. This may be your difficulty. Thirty services up to this date ought not to be an excess, but if you have bred 30 mares several times each, you should limit the services to one service a day until your stallion gets better, at least. Weather conditions are always against the best results during the early spring. Do not change the feed or make any other sudden change. Get along with this horse the best you can this season. The results you have described will be a very good lesson for you and other breeders—prepare your stallion for service by starting early. Do not use this stallion for teasing mares if it excites him much. The quickest way for you to know whether this stallion is right or wrong, is to have the semen tested. If it is not good withdraw him from further service for several days and then make another test. Should it not prove good at that time, retire him for the season.

SLOW JACK—What advice can you give me about a jack that won't serve? He is three years old and seems to be all right in every way, but pays only a little attention to mares and will not try to make a cover. Should I give him something to get him started? He has never served.—Kansas Subscriber.

REPLY—We would advise you to get an experienced jack man to break this jack for you. The right man in a case of this kind is worth all the vigor tablets and other drugs that you can purchase. In addition to that, the right man knows how to handle the jack so as not to ruin him as a producer, which most of the drugs will do. There is very seldom excuse for anyone having a young jack that won't make a service.

PERCHERON STUD COLT WEIGHT—Please tell me what a Percheron stud colt one year old should weigh.—Nebraska Subscriber.

REPLY—A stud colt properly matured at 12 months of age should weigh 1,000 pounds or more. If a colt is from good registered ancesters, and did not weigh that much at that time, its development has been interfered with.

PREGNANT—IN HEAT—I had a mare come to my horse in the early part of season, and on examination, I found the cervix open and apparently in good condition. I let the horse cover her and told the man to bring her back on the 21st day, which he did, and she was not in season, but on the 22d day she was in season. On examination I found the cervix apparently sealed tight. I did not breed her. Would be pleased to have advice on how to handle this mare in the event she comes in again after this heat period.—Arkansas Subscriber.

REPLY—You may insert a nickel plated speculum into the vagina so as to get a good survey of the cervix. If it is closed in a case of this kind, do not touch the cervix with your finger, as an abortion might follow. If you manipulate the cervix on the 21st day with your finger and the mare came in heat on the 22d day, in all probability you can cause an abortion, and furthermore, you will probably have a mare that will be hard to fertilize this year. So it stands every breeder in hand to be careful about these miscarriages. It is very easily done. The material which forms in the mucous plug in the end of the cervix, if interfered with, becomes infected and will liquify and run out. A good speculum is a very necessary instrument in horse breeding. An instrument used for this purpose should be of metal, as glass speculums are very easily nicked, and glass is not a good thing to use for this purpose.

TEMPERATURE OF MARES—Will you please tell me what temperature mares should be for breeding?—Illinois Subscriber.

REPLY—From 98 to 100 degrees Fehrenheit.

REGISTERING SHETLAND PONIES—Please tell me if there is any place where Shetland ponies can be registered by the size. I have a fine stallion five years old, 36 inches tall; weight 250 pounds. He is a model in shape and a typical little horse with every point a model, and goes all the saddle gaits. I bought him in another state when a colt, intending to castrate him, for my little girl, but he was such a fine shape that I kept him for a stallion.—Texas Subscriber.

REPLY—Write to J. M. Wade, Lafayette, Ind., he is secretary of the Shetland Pony Association.

THE RIGHT WAY

IN ALL CASES OF DISTEMPER, PINKEYE, INFLUENZA, COLDS, ETC., of all Horses, Jacks, Mules, Brood Mares, Colts, Stallions, is to

SPOHN THEM

On their tongues or in the feed put Spohn's Liquid Compound. Give the remedy to all of them. It acts on the blood and glands. It routs the disease by expelling the disease germs. It wards off the trouble no matter how they are "exposed." Absolutely free from anything injurious. A child can safely take it

50 cents and $1.00; $5.00 and $10.00 the dozen. Sold by druggists, harness dealers, or sent, express paid, by the manufacturers.

Special Agents Wanted.
SPOHN MEDICAL CO.,
Chemists and Bacterologists,
Box 834. Goshen, Ind., U. S. A.

Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good ½, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in a substantial box and sent promptly by mail. It is a paste and applied with a small brush.

Send money by bank draft or P. O. money order. Price $5.00.

O. P. Wilson & Co., 3754 Wayne Avenue, Kansas City, Mo.

Stannard's Processed Crude Oil

THE BEST DIP MADE

for killing lice and curing mange. One application will do more to kill lice and cure mange than three applications of any other dip made (it destroys the nits). . .....$5.00 for 52 gal. bbl.

I also carry a full line of lubricating oils.

I will pay $1.25 each for my crude oil barrels; $1.50 each for my refined oil barrels, returned to me at Coffeyville, Kas., in good order, less freight charges on same.

C. A. STANNARD, BOX A, EMPORIA, KANSAS.

BEST I EVER SAW.

To the American Breeder:—I think your paper is the best to advertise in that I ever saw. I can't get along without the paper.—G. W. Newman, Hancock Count, Ill.

CAPSULES TO A NEW SECTION.

To the American Breeder:—My first capsule colt was born a few days ago, and believe me, I was sure proud of him, as I was jeered at for ever trying such a thing. Yet I put up no argument, as I thought that I might fail, but went on with my work in silence. I bred only six mares with capsules last year and they are all showing up good. Will have picture taken of colt and will send you same. He is the first of its kind I know of in this part of the country.—Bert Cassan, Antencio, Union County, New Mexico.

TWINS FROM CAPSULE SERVICE.

To the American Breeder:—I must say the capsule system is a success. Don't have any trouble in getting people to use it. Got a pair of twins from a capsule and have lots of capsule colts in the country.—T. F. Jahneke, Mayfield, Okla.

"The capsule method is all you claim it to be. It is surer and safer in many ways than the natural service. If failures occur, everything else being right, it is not the method which is to blame but the carelessness of the man trying to do the work."—Chris J. Weiterer, Prairie View, Ark.

"I have been using the capsule method of breeding for the last three years with better success each year. I have never had a poor capsule colt. I find there are some that are very difficult to settle by natural service that are easy by the capsule method. I breed but once a day. I believe I would quit the horse business if I had to go back to the old method and stay at the barn all the time."—J. J. Adams, Dinuba, Cal.

"I have one of the best jacks I ever saw. He was got by a capsule. I have got mares in foal that I could not get in foal by the horse or jack."—A. B. Carpenter, Coffeyville, Kas.

CAPSULING UNDER DIFFICULTIES.

To the American Breeder:—I have been a subscriber to your valuable paper since its first issue, and would

not be without it. I own (with two partners) the best Percheron stallion in this state, I believe—Pitchegrue (65142) 43281. We have adopted the capsule system and are beginning the third season with the capsules and have done exceedingly well. We breed mostly wild mares, by the use of a chute. One mare I placed in the chute and she put up an awful fight and finally got out. I then tied up one hind foot, but that would not do; she finally threw herself. I tied her down and bred her by capsule and the next spring she had a fine colt, a dead image of the horse.—Dudley Wilson, Lander County, Nevada.

Scientific Horse Breeding

By FRANK B. GRAHAM.

(Continued from page 4.)

quietly so that she may become accustomed to the situation. The operator should stand a reasonable distance behind the mare so as to watch the flow of urine. If the urine falls straight down the chances are that she is in heat, as the clitoris expands giving a wider space during the heat period. If it should fall far back there is little use to try the mare further. A great many mare are bred while pregnant; about 10 per cent of all pregnant mares will accept the embrace of the stallion at some time during pregnancy. Mares should not be teased extensively on the twenty-first day, which is the regular return day after a mare has been bred, as an abortion is easily induced at that time. A great many mares are made shy breeders through the opening up process at about that period. After a mare has aborted it is usually difficult to make her fertilize later on.

About 85 per cent of the colts that die before weaning time are foaled before May 1. June is the best month in which to breed mares. Colts come after the mares have usually had a little grass, which has eliminated all the poison from the system and the sun has had an opportunity to destroy much infection in the pastures that might cause "navel ill." The mare being in good condition the colt grows rapidly, without being stunted, and usually makes just as good a horse as one of its early neighbors. Colts should never be stunted at any time if they are to make the best growth. Colts produced for show or other purposes may be produced earlier when special care is given. In June mares have passed through the shedding process; they have become accustomed to their general work and are in their regular working form. The mucous membranes are clear and very little catarrhal condition is present. There is no other month in the year when mares fertilize more readily than in the month of June in this section. With the latest modern methods all the mares in one community can be bred to one stallion during a very short season. One good outstanding individual is worth more as a sire to a community than a whole herd of misfits, but in order to accomplish this it is necessary for the owners of mares to demand that the individual who handles breeding stock to be better posted, as a rule. There is no other investment that equals that of a good sire in the hands of an individual who is proficient and who has the co-operation of the better class of mare owners in his particular section.

Stallions and jacks are different from any other class of live stock. It is not usually necessary that mare owners buy either of these, as there are not many men who own enough mares to make it necessary. In order that some individual purchase a good, outstanding individual, it is first necessary to make it profitable. He can not afford to make the natural service on a lot of diseased mares, but it is necessary that he collect a reasonable service fee from each mare producing a colt. About 25 per cent of the colts in the United States are never paid for; the owners of the other three-fourths of these mares pay all the expenses of maintaining the stallions and jacks. If a law was enacted in every state giving the owner of a stallion or jack a lien on the mare and colt for eighteen months after the mare had been served the competition would reduce the service fee to the honest mare owners. It would make the horse breeding business a pleasure and more profitable to the men who breed mares, as well as to the stallion owners. A great many mares are traded and sold before they are known to be in foal. I have colts in a dozen different states that never were paid for and never will be. Nearly every stallion owner is in the same position. Every honest mare owner that is interested in better horses should favor a law giving a lien on the mare and colt, for it will make the service fee cheaper to him and not cause the stallion owner to spend so much time collecting difficult debts. Many breeders state that they would rather breed the mares than to collect the service fees. Mare owners should also be particular about the individual who does the breeding and demand a more cleanly, skillful job, for it means dollars to them.

Every stallion owner who expects to receive the future patronage of those with whom he is in yearly contact must give his patrons value received and do business on the square. There is no other individual in a community who is in a position to do more good than the stallion or jack owner, and we should urge them to lead a good, clean life and set a good example for all those with whom they associate daily.

I'll Rid Your Stock of Worms

Look Out for Worms This Month

Right now is the time when stomach and intestinal worms get in their deadliest work among farm animals—especially among your sheep and hogs. They fasten themselves along the digestive tract—steal the food, suck the blood and sap the strength and vitality of your stock. Look out for these danger signs: Coughing, poor appetites, dull eyes, rough coats and laggard steps. If neglected, some will die; hog cholera and other contagious diseases will get a foothold easily; all will fail to gain as they should, and your stock profits will quickly vanish.

I'll rid all your stock of deadly worms, or no pay. I'll send you a supply of Sal-Vet to try 60 days at my risk.

The Great Worm Destroyer — TRADE MARK SAL-VET REG. U.S. PAT. OFF. — The Great Live Stock Conditioner

kills and expels all the deadly stomach and free intestinal worms. Being a medicated salt, it is easy to feed—requires no dosing, no mixing, no drenching, no starving, no handling. You simply place it where all your stock can run to it freely and they will doctor themselves. Read these letters:

S. R. FEIL, Pres.

"In my judgment if farmers were to depend upon Sal-Vet and keep it before their stock the worm problem would be solved."

DR. C. D. SMEAD,
(Prominent New York Veterinarian and Veterinary Editor National Stockman and Farmer and N. Y. Weekly Tribune.)

"Having used Sal-Vet at New Hampshire College last year and the year before, I am in position to know its great value."

JOHN D. McNUTT,
Prof. Animal Husbandry, North Carolina College of Agriculture.

Send No Money—Just the Coupon

Fill out the coupon at the left—mail it to me today. I'll send you enough Sal-Vet to last all your stock 60 days. (It costs only one-twelfth of a cent a day for each sheep or hog and but slightly more for larger animals.) You simply pay the freight charge when it is received and when the 60 days are up report results. If you are not satisfied that Sal-Vet has done everything I claim for it, I'll cancel the charge—you won't owe me a penny. Send the coupon TODAY!

60-day trial shipments based on 1 lb. of Sal-Vet for each hog or sheep, and 4 lbs. for each horse or head of cattle as near as we can come without breaking regular packages.

PROOF from SAL-VET Users

"Your Sal-Vet has done all that you claim, and perhaps more. Hog cholera has been all around me, and I have not had one sick hog. I cannot praise Sal-Vet too highly, and I do not hesitate to recommend it to all hog raisers." — (Signed) A. O. Kellogg, Troy Grove, Ill.

"I fed a carload of hogs on which I made a thorough test of Sal-Vet for seventy days. Cholera or some disease like it was killing off hogs all around me, but I never had a single one sick; they remained in fine condition during the entire time."—(Signed) W. C. Grove, Box 235, Hominy, Okla.

"I have fed 200 lbs. of Sal-Vet and can say that it is the best worm destroyer that I ever used. When I started to use it I found that within twenty-four hours the number of worms expelled from my hogs was surprising."—(Signed) H. C. Grundy, Route No. 4, Walnut, Iowa.

"I am greatly pleased with your Sal-Vet; my hogs are doing just fine, but my neighbors all around me, who have not used Sal-Vet, have had heavy losses."—(Signed) Jerry C. Smeltzer, Box 33, Canalou, Mo.

"After feeding Sal-Vet thirty days, I am convinced that it is a great destroyer of worms in hogs. I do not think that any farmer raising hogs can afford to do business without it. As every hog raiser knows, at some period of a pig's growth the animal becomes infested with worms. My experience has been that Sal-Vet rids them of these parasites and increases the appetite so that the pigs show greater thrift in a short time."—Cecil W. East, Clay Center, Neb.

"For miles around the hogs belonging to my neighbors are all dead, but I have a nice bunch, all ready for the market—thanks to 'Sal-Vet.' I feed it regularly to my hogs and they have had not even the sign of any disease."—W. J. Irvine, Oelwein, Iowa.

"'Sal-Vet' has saved my hogs. Hogs belonging to my neighbors have all died, while I have not lost a single one. The entire herd is thriving finely."—L. Dittmer, Emerald, Nebr.

"We were losing sheep from stomach worms, but since feeding 'Sal-Vet' we have had no losses."—D. Baden, Independence, Kan.

"I am sending you the money for the hundred pounds of 'Sal-Vet' which you sent me. Our hogs are all living, although my neighbors lost all they had, principally from cholera."—A. J. Klause, Sealorth, Minn.

PRICES 40 lbs., $2.25; 100 lbs., $5.00; 200 lbs., $9.00; 300 lbs., $13.00; 500 lbs., $21.12. No orders filled for less than 40 lbs. on 60 day trial offer. Never sold in bulk; only in Trade-Marked "Sal-Vet" packages.

THE HORSE BREEDING SCHOOL

The Only Term Between Now and December Will Be Held August 11 to 16

Breeders with money invested in the business cannot spend a week's time and the tuition fee to better advantage than here, and there is no better preparation for the beginner.

Whether it is **you** or **your son** who is coming, do not fail to read what these graduates say about the character of this school. We have never had room in our announcements for all the good letters we receive. Below we reprint about half the letters received between the last two terms of last winter:

I have attended the school and find every lecture or demonstration worth my expenses.—Fred Boester, Winchester, Ill.

I think this school is the best thing for stock men I ever attended. I don't see how we can get along without it.—Charley Zollar, Tonti, Ill.

I have attended the school and find that it is a school of high moral standing, and no one can attend it without getting the worth of their money.—G. W. Underwood, Valley Center, Kas.

I have attended the school for the second time and am much interested in the high class instruction, and gladly recommend it to any progressive breeder.—Wm. Freitag, Minier, Ill.

I have handled stallions and jacks for forty-six years and thought I knew the business pretty thoroughly, but one week at the Graham School was a surprise and an eye opener.—H. F. Fox, Sedan, Montana.

I have attended the Graham Scientific Breeding School and think it is one of the greatest things in the world, and anyone that is in the business of horses and jacks, should attend.—J. J. Smallwood, Denlow, Mo.

I have attended the Graham Scientific Breeding School and I think that I have been repaid many times the cost. Any stallion keeper should attend. It is conducted on a strictly moral plan and I would not hesitate to send my boy there and feel sure he would be guarded from going wrong and would come away better prepared to resist the evil ways of the world.—J. G. Arbuthnot, Cuba, Kansas.

I can heartily recommend the school as an institution of high character. The moral influence I have received from one week's stay at the school will be worth many times the amount of tuition to my wife and four little boys. The able lectures are the best in their line the country affords. No father should hesitate to send his boys.—C. L. Clayton, Wakefield, Kas.

After several years' acquaintance with Graham's Scientific Breeding School, through the columns of the American Breeder, I was able to accomplish a desire of long standing, and many disappointments, by attending the January, 1912, term. In common with the declaration of many classmates I do not hesitate to say that the lessons of any one or two days amply repaid the full cost of the trip, the time and the tuition. Nor can I do less than say that the high moral influence of the management and of the many Christian members of the class will be one of the pleasantest memories of my life, and so long as I shall put in practice the teachings of the school I shall rejoice that so many clean men are proving that no odium of necessity attaches to business of using the laws of nature's God in producing horses.—D. M. Johnston, Storm Lake, Ia.

I have been very much impressed with the way this school was carried on this term. It was a success from beginning to end. The instructors are better than before, and I am perfectly sure that a father can send his boys to this school without any risk.—H. D. Penner, Potwin, Kas.

I have attended the school and think it is all right. You need not be afraid to come and you need not be afraid to send your boy. I was much pleased with the school.—Jas. H. Hall, Whiting, Iowa.

I have attended the Graham Scientific Breeding School and learned the wonderful value of this school, both morally and scientifically. Parents should send their boys to this school. I advise every breeder to attend this school.—A. A. Williams, Conway, Kas.

This is my second term to this school and I can see a great improvement over the former term, especially in the moral character and the way the professors delivered the lectures. The school is a great place for any horse man to attend.—E. J. Brouhard, Colo, Ia.

I attended the Graham Scientific Breeding School and found it excellent, and cannot see why any breeder of pedigreed horses and jacks can get along without this fine work, for what little time and small amount of it, will cost to get this good session.—Peter Yung, Jr., Salisbury, Mo.

I have attended the Graham Scientific Breeding School and think it is O. K. I think all horse breeders and mare owners ought to attend one term.—J. F. Foster, Oregon, Mo.

I have attended the January, 1913, term of the Graham Scientific School. Am very much pleased with the work and the manner in which it is carried on. I think it very essential that every mare owner or horse breeder should attend.—H. B. Woolsey, Maquon, Ill.

I am well pleased with what I have learned at the school. Any one lecture is well worth the cost of the term.—Frank Countryman, Thayer, Kas.

This is my first term and will say that in the first two lectures I received information enough to fully repay all my expenses. Furthermore, the moral influence of the institution is beyond reproach.—H. C. Brenizer, Abilene, Kas.

As a student of the Graham Scientific Breeding School, will say I am more than pleased with what it gives. First, it makes better men of its students—gives them a better knowledge of the laws of health of both man and beast, as well as giving the knowledge of the breeding problems that are confronting us in this day. It is a progressive movement.—J. M. Seward, New Providence, Ia.

I have attended the January term of the Graham Scientific Breeding School. Every stallion or mare owner should attend this school for the benefit of the horse industry of our country, and also for its moral influence. Any parent need not hesitate to send their sons to this school. I would advise any one who intends to stay in the horse breeding business to attend this school. I cannot praise this school enough for the good it is doing in this country in this respect.—Henry J. Stuhr, Minden, Ia.

This is my second term at the Graham Scientific Breeding School. I think it is a great thing for stock breeders. Every man that handles stock ought to take a course. It means better farms, better stock and more money for the farmers.—J. R. Brooks, Cairo, Mo.

I have attended the Graham Scientific Breeding School and must say I cannot place a value on the information which I have received, as one lecture alone was worth many times the cost of tuition, and must recommend it to others. Parents, don't be afraid to send your boys, for they can't help but come home better men and will be of much good to the community morally.—Carl O. Williams, Kempton, Ind.

I attended the last term of the Graham Scientific Breeding School and cannot say enough for this school. In the first place, all of the instructors are of the highest moral character. As to the value of this school in dollars and cents, I cannot express it. Each and every one of the lectures is worth more to me than what my tuition cost me. The one lecture on "Germs" is worth everything to me. I cannot understand how I got along before. I wish that every farmer and his boys could attend the next term.—Louis Knopp, Cole Camp, Mo.

I have attended the Scientific Breeding School and will say it is a place where you practically get something for nothing, considering what it cost, especially, not only from the breeder's standpoint of view, but of the moral character of the instructors and of the morality taught in the school. Would not take $1,000 for the information I got there.—R. A. Fitzgerald, Bucyrus, Kas.

The character and morality of this school is above some of our state institutions. I am a booster for scientific breeding, and every mare and stallion owner is doing himself and his community a financial and religious injustice in not attending this school.—Ray Johnson, Union, Ia.

I believe the Graham Scientific Breeding School is a good thing, and it is not only a good thing for every breeder to know, but it teaches a good many things that everybody ought to know. Am well pleased with the school and shall attend again later. Every man that attends is doing a great thing for his community as well as for himself.—C. H. Wempe, Seneca, Kas.

I have just finished a second term of the Graham Scientific Breeding School and can say the more a man sees of it the more he thinks of it. Any one of the lectures is surely worth the price. It is a place where no man need be afraid to send his son.—Chas. W. Stouffer, Merna, Neb.

I have just attended my first term at the Graham Scientific Breeding School, and think it a great help, and would gladly recommend it as a valuable school for anyone to attend, especially all stock men and their boys.—C. H. Zachry, Merna, Nebraska.

I have attended the January term of school and think that the faculty there have a way of presenting the knowledge of scientific breeding to the student so that he cannot help but feel that he is getting the full worth of the price of tuition. The moral spirit of the place is good enough for anybody. No parent need fear for their son's welfare. Success to the school.—E. N. Irish, Blandinville, Ill.

I have attended my first term of the Scientific Breeding School and am more than satisfied with what I have learned, and wish to state that so far as I can see no father or mother need fear for the morals of their sons under such instructions, for they will gain knowledge that will raise the standard both morally and scientifically in any community in which they come in contact.—T. T. J. Parker, Laddonia, Mo.

It's the greatest opportunity offered anywhere to make yourself an expert breeder, to learn to avoid the points of the breeding business that cause so much loss to stallion and jack owners every season. All of the instruction is practical and everything taught is demonstrated whenever possible. All instructors but two are expert post-graduate veterinarians doing educational work recognized by the United States Government.

SOME OF THE SCHOOL'S WORK, INCLUDING SUBJECTS TAUGHT.

Dissecting Mares, Anatomy and the Male and Female Organs, Physiology of the Generative Organs, Cells, Infection, Breeding Questions, Breeding Instruments, Foaling, Scientific Mating, Horse Judging, Mule Judging, Barren Mares, Barren Stallions, Abnormal Conditions, Diseases of the Foal and Fetus, Diseases of the Male and Female, Contagious Abortion, Feeding, Testing Breeding Stock, Determining a Mare's Breeding Condition, Buying Breeding Stock, Hereditary Defects, Horse Breeding, Rectal Examinations for Abnormal or Diseased Conditions; also tell whether a mare is in foal or not. Getting the Semen, Inserting Capsules, etc.

EQUIPMENT AND EXPENSES.

The school has its regularly equipped building, which is just north of Convention Hall, Kansas City, Mo. In the lecture room of this building are numerous charts, stereopticon apparatus for showing pictures and illustrations during the lectures, all kinds of breeding appliances and other equipment necessary for instruction in all the latest methods in horse breeding. A veterinary hospital is utilized in the dissecting work and the barns of dealers in mules and horses in the lectures on types, judging, etc.

Accommodations for all students will be arranged for by the school authorities without charge. They have reserved rooms and board at moderate rate—from $1.00 to $1.25 per day—sufficient to provide quarters for all who come.

Remember the date and prepare to be here next term. When you get here take Observation Park street car at Union Depot; get off at 12th street and walk one block east. **Tuition is $25, which entitles all students to a free return privilege for life.** For other information address

VOLUME 6. KANSAS CITY, MO., JUNE 5, 1913. NUMBER 10.

Appearance of Breeding Barns

How Accumulated Manure and Neglect of Repairs Injures Animals and Hurts Business. How Cleanliness, Conveniences and Consideration for Others Will Help.

Even the best of stock do not appear to good advantage in a dirty, run-down shack. Some breeders are not able to occupy expensive barns, but there is no excuse for having filthy places in which to keep stock.

The writer visited a barn a few days ago where the breeding was done in a large shed. This shed was substantial and could have been made a very satisfactory place in a short time. But there was from two to four inches of loose manure on the floor. It was a good clay floor and would have taken only a few hours to remove this manure, after which the floor could be swept and kept clean. There was enough fluid being spilled on this manure to make a good breeding place for flies. Just outside of the barn was a very large pile of manure under the eaves of the barn, so that the rain would keep it moist and also make an excellent place for the propagation of more flies. The breeding stock were switching their tails and there were several sore spots as evidence that the flies were getting satisfaction. One very valuable jack had numerous sores that, in the writer's opinion, were caused largely from being in a filthy barn and from the effect of flies. A few hours' work could have made an entirely different looking place, but the individual in charge of this breeding establishment had an empty soap box which he used the greater part of his extra time.

The breeding business is not a lazy man's job. Too many individuals have come to the conclusion that it is not necessary to attend to these little things. A little work each day would add to the appearance of an establishment and mean more money in the end. It is easy to get in the habit of resting most of the time. Even though the weather has been cool in some sections, the flies have already put in their appearance. The average breeder does not realize how much damage flies do to valuable stock or how easy it would be to defeat them. In most localities there are plenty of farmers who would be glad to haul away the surplus manure each day. It does not take any longer to clean the barn out a little each day than to let it accumulate and remove it once a week or once a month, or, as some do, move the barn.

A good clay floor is very satisfactory and can be kept in repair very easily. A load of fresh clay occasionally can be tamped into the holes and low places so as to have a smooth surface. A good stiff broom can be used to remove the manure and dirt daily. A spray holding a quart or a half gallon with any of the standard disinfectants can be used in spraying the floor so that flies will not be so numerous. A few sheets of fly paper tacked up in good locations usually catches a good number. There are numerous fly traps on the market that have given good results.

But the best and cheapest preventive for flies is to have the entire enclosure screened, that is the doors and the windows or other openings. A few dollars invested in screen will not only make it a pleasant place for the stock, but for the attendants also.

Flies are not particular as to their company, or locations visited. When one enters an establishment where flies are bad he forms an opinion as to the cleanliness of that establishment. Flies carry disease germs and everything should be removed that would invite their presence. There is one thing (out of many) that alone should cause every breeder to exterminate all flies possible, and that is that it actually requires much more feed to keep stock in good condition while it is being tormented with flies. The money spent in excluding them will be saved in feed.

The inside of every barn could be whitewashed to a good advantage. This is very cheap and greatly adds to the appearance as well as destroying much infection. The following is the government formula for making whitewash:

Government Whitewash.

The government recipe for whitewash is as follows: "Slake half a bushel of quicklime with boiling water, keeping it covered during the process. Strain it, and add a peck of salt dissolved in warm water, three pounds of ground rice put into boiling water and boiled to a thin paste, half a pound of powdered Spanish whiting and a pound of clean glue, dissolved in warm water; mix these well together, and let the mixture stand for several days. Keep the wash thus prepared in a kettle or portable furnace, and put it on as hot as possible, with either painters' or whitewash brushes."

Every stallion and jack owner ought to have this recipe. You will find it a good thing to use in changing barns with your stock, as it will help protect your stock from lurking infection. It is very cheap, and with a large brush, you can go over the inside of your barn and make it have a very different appearance in a very short time.

The writer visited a barn a short time ago where the owner was very anxious to show a fine stallion. It was with considerable difficulty that he finally got the rope and the wire and the boards away from the door so that the door might be opened. A few minutes' time and a good latch, either iron or board, could have made this convenient. It is safe to say this individual lost enough time opening and closing the door each week to have fixed it up substantially.

After the door was finally opened we looked down on a good horse which was standing about a foot lower than the hallway, which made the stallion look small. A few loads of clay in that stall would have made that horse look several hundred pounds larger. The stallion was brought out with an old dirty bridle on. The horse's mane and tail had not been cleaned out for weeks. He was dirty; had not been curried or brushed; and his feet showed signs of thrush. A little time would have made this horse look respectable. The horse acted like he had not been out of the stall for a long time. The stall was dark and if that stallion is kept in that dark hole he will go blind—if he lives long enough to go blind.

But the worst part of it was that the owner complained (confidentially to the writer) that the stallion was not getting his mares in foal; they were returning too fast. It is a peculiar condition when breeders will be so particular about the horse they buy only to take him home and ruin the chance of making the most out of him. A nice new bridle, a good coat of hair, mane and tail cleaned out straight, and his feet shined, and this horse would have made a good appearance. If this breeder had a good clay floor in his barn and kept it swept clean each day; if he had cleaned out the frogs of that horse's feet and tamped salt around the frogs two or three times a week, his feet would have been all right and would have presented a different appearance.

The location of a barn has some valuable. If it is situated so that a good, big sign somewhere on the barn may be seen from public highways or railroads, its location will be remembered better by the public. The regular residents might learn the location of an out-of-the-way place, but in many localities newcomers are quite frequent. These must ask. Where they can see a sign on a barn and the place has a nice appearance, it usually adds to the standing of the owner, and of the stock kept in it.

It might be profitable to have the barn painted, not only for the appearance, but paint is a good investment. The work might easily be done at odd times by the owner himself, so as to diminish the cost. Occasionally one sees the boards kicked off or some part of the building, and other disorders that could be repaired very easily and with little expense, but to good advantage. It is surprising how the appearance of a barn can be changed with a little work and a few dollars' worth of paint.

Barns located in the city often have many advantages in keeping the premises clean. City water is very convenient for this purpose. Oftentimes electric lights may be used and when properly installed are much safer than coal oil. Occasionally when a barn is located where these advantages may be had, nearby residents may not be pleased with its close proximity unless it is handled very quietly. This can usually be accomplished by doing the breeding under a roof and not allowing any animal to appear in an objectionable condition in view of the public. If the premises are kept up in good condition and as much noise avoided as possible, there is not usually much difficulty in this respect.

When mares are, for the first time, presented for breeding, the proprietor or individual in charge, should have things about the place arranged as inviting as possible. If this place is recognized as headquarters for a gang of toughs, where all kinds of vice is encouraged, a lot of people will not patronize it. If plain signs are conspicuous indicating that profane or vulgar language is not wanted, and such other signs of evidence of a cleaner life, this would create confidence in the minds of patrons. "No Smoking" is a very profitable sign to have up in any barn. If there are no matches used about the establishment there are not likely to be any fires during the breeding season. Barn fires usually are the result of careless smokers. If all loose material is swept up and the place kept clean every day, this also prevents fires.

The operator should be prepared to make a scientific investigation as to the breeding condition of each mare. It is not very expensive to purchase two painter's suits, which may be had for about $1.00 each. By having two suits a change may be had which gives the breeder an opportunity to have a clean one at all times. Those who are capable of making a rectal examination of doubtful mares for diseased ovaries, large kidneys and abnormal conditions, also using the litmus paper and a speculum, as well as attending to other minor details in

Do You Want This Paper?

Do you want a paper that really tells you things—things you can't learn through any other? You know that on the average farm the horse and mule stock is worth 12½ per cent more than all hogs, cattle and sheep put together, and that in cities there are thousands and thousands of horses and none of the other stock. Your business is at the foundation of the most important live stock business in the world. Do you want the paper that makes a specialty of this business, and goes farther in it than any other paper has ever gone?

THIS IS THE PAPER---THE AMERICAN BREEDER

AND YOU CAN GET IT UNTIL FEBRUARY, 1914, FOR 50 CENTS, WHICH IS A SPECIAL PRICE TO NEW SUBSCRIBERS ONLY.

Fill out This Coupon and send at once with 50c in currency, stamps, check or money order.

To Graham Pub. Co., 225 West Twelfth St., Kansas City, Mo.

I enclose 50 cents for which send me the American Breeder until February, 1914.

this line, create confidence in their ability, but the individual who is capable of making an examination for diseased conditions in a mare, using a high power microscope and preparing specimens of mucous and discharge for this purpose, is considered a wonder among horse breeders today. Such microscopes may also be used in testing the semen and used competently have the additional value of being one of the best advertisements.

These things all have their bearing in a business way. When breeders get to understand the new methods and talk among themselves about the ability of a certain breeder in being able to tell what is the matter with a mare, and the best thing to do for her, it is far reaching. It is wonderful how far men will take their good mares since it has become better understood that there is great danger of infection being transmitted from one mare to others, through ignorance.

Many breeders are making a mistake by not taking the best intelligent mare owners into their confidence and explaining to them some of the different things about the breeding business. Every breeder should be careful about his statements. If he is not thoroughly informed on any particular subject, the best answer in this case is to say that he does not know, but that he expects to learn. Breeders, as well as other men who are doing business continually with a particular class of customers year in and year out, must learn sooner or later that these customers know them better than they know themselves, in some respects.

Actual results count for much. There are many men who are especially adapted to the breeding business and have done exceptionally well, but no individual should get in a rut and not be able to advance a little each year. Every breeder should study his location and conditions closely and make the best of what he has to work with. It is not necessary that his barn be big or showy, or made of the best material, but it is necessary that it be kept clean and have the appearance of as good care as possible.

VIRGINIA LIVE STOCK DIRECTORY

The Animal Husbandry Department of the Virginia Polytechnic Institute, Blacksburg, Va., has put out a convenient directory of the live stock breeders of the state, and included in it a list of the live stock record associations of the United States. Copy of this book can be had by addressing Dr. N. S. Mayo, head of the department, at Blacksburg, Va., and enclosing six cents in stamps.

"TOO MANY HALF-WAY HORSES."

To the American Breeder:—Been very busy this spring. Stock is in fine condition; crop of colts good; no disease; big lot of breeding being done, but first class horses are scarce. Too many half-way horses; not big; from 1,500 to 1,600 is the average weight, with lots of fat at that. I have been in the horse business here for 15 years and know whereof I write. I have always tried to get the best. The Belgian is my choice of all draft horses; they sell for more money and are easily put in shape for the market; they are never sick and always ready for harness; easy to break to work and are kind to their masters and good feeders. Iowa will be in the front soon in the horse industry. Have just secured a law cutting out the grade stallions and mongrels.—W. H. Johnson, Morgan County, Iowa.

FOR BITING STALLION.

To the American Breeder:—I just read in your paper of May 20 a piece in regard to a stallion biting a mare when making the cover. Now, when I have such a horse as that I put an old horse blanket on the mare just in the same shape as I would if I were going to stand her in a cold stable. Buckle the neck, then turn the back part over so it will be about the center of her back, or double over the shoulders, and your horse will not bite very often and will serve much better, as I have had good success with this plan; I have tried it often and have never had any bother. I tried strapping the jaws and got no results until I tried the blanket. Some horses don't like a wet mare; there is a peculiar smell that makes them bite. Try the blanket and see what it will do.—Reuben Warren, Dunn County, Wisconsin.

GRAHAM SCIENTIFIC BREEDING SCHOOL.

This institution was started several years ago at the request of horse breeders. It has been patronized by breeders from nearly every section of the United States and several foreign countries. It lasts one week, beginning at 7:30 in the morning and lasting until 10:30 at night, with continuous lectures and demonstrations. No time is lost.

All of the instructors but three in this school are post graduate veterinarians, doing work recognized by the United States government. One of the other three was employed by the Illinois University for seven years and has prepared more text book literature on horse conformation than any other individual in the country. The other two have made a study of scientific horse breeding and carried on more experiments and tests than any other two men in the country.

Nearly all the lectures are illustrated. Mares are dissected and there are numerous other demonstrations where the students are required to take part in the work.

This is not a veterinary college. It is a school for breeders only. Everything is made plain so that horse men can thoroughly understand it. It is a very interesting sight to see a large number of breeders of all ages interested in the dissecting of mares; making rectal examinations; locating all the organs and getting a thorough foundation upon which to build. The examination of mares is one of the most important things in horse breeding.

The tuition fee for the Graham Scientific Breeding School is $25 for a life membership. After attending one term the student can attend as many terms as he cares to without paying further tuition. Breeders should attend the August term (August 11 to 16), which will prepare them for some practical experience before the next spring breeding season starts. Most every breeder will have a good number of mares that he will be very glad to get in foal during the fall season so that they will not interfere with his work during the next spring's busy time. Among these will be, as a rule, some of the shy breeding mares that cause the breeders much worry and loss financially, each spring.

The August term will be the last term until next December. The tuition fee may be advanced after the August term, as much new work is being inaugurated, making necessary a heavier expense.—Advertisement.

LIKES HAMPSHIRE HOGS.

To the American Breeder:—Horses in this vicinity are, as a rule, very healthy; 1912 colt crop doing fine and so far 1913 colt crop good. Lots of fine colts here. We have a fair supply of cattle, not overstocked as usual; buyers paying up on them. Nineteen thirteen crop of young pigs good and doing fine, considering early cold weather and rains. Spring late and the farmers were late planting corn. The Hampshire hogs are the best here.—A. P. McGregor, Wright County, Iowa.

Questions and Answers.

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

CATARRHAL VAGINITIS—There was a mare came to my barns today which had a disease in the vagina and I do not know what to call it. The vagina was filled with a white, foamy substance, and it was sticky. The foam resembled soap suds very much. Her temperature was normal throughout. Can you tell me what this is called? I gave her a good cleaning out and sent her home. I never saw anything just like this before.—Kansas Subscriber.

REPLY—Such animals should not be bred until they have been given a course of treatment, which usually needs to extend over a period of several weeks. A further examination may disclose that the condition extends to the uterus, which, if true, would serve to complicate matters.

RING BONE—I would like to know of a cure for a ring bone on a horse. I have a good Hambletonian horse that has a ring bone on his left hind foot. —Idaho Subscriber.

REPLY—We know of no certain cure for ring bone, especially in a case of long standing. The firing iron coupled with vesicants and long rest has given the most certain results. A skillful veterinarian should make the application, for if improperly done the animal may be ruined.

FAIL TO CONCEIVE—I would like to have some information in regard to two jennets. These jennets both lost colts two years ago and I have bred them faithfully ever since but have never got them with foal. Tell me what you think is the matter with them. These jennets have both raised a colt and lost the second one. Both of these jennets are seven years old and 15 hands high.—Indiana Subscriber.

REPLY—Your question can only be answered in a general way. First, they may have become infected by a jack which has left the generative organs in a diseased condition. Second, they may have suffered from some catarrhal disorder which localized in the generative tract. Don't breed these jennets until you have had them carefully examined by some one competent to pass on this point. Any graduate veterinarian or graduate from the Scientific Breeding School should be able to help you. A manual examination and inspection is necessary.

HARD LUMPS ON THE BODY—I have a four year old black grade Percheron mare that the two last springs has broken out with small hard lumps over her body; in a short time they break and a dry tough scab forms. I bought this mare's dam as a four year old and she was affected the same way. I raised three colts from her, one older and one younger than the one mentioned, but neither of them are troubled this way. This mare has a young colt now and I wish to keep her as a brood mare as she gives promise of being a good one. Would be pleased to have you advise me what to do for this mare. A few lumps are beginning to show now. She has never been overheated and is in good condition in every way except this breaking out; it causes her lots of annoyance in fly time.—Kansas Subscriber.

REPLY—If a microscopic examination was made of the contents of these nodules it would usually disclose some form of germ life or fungous growth. A few drops of Lugo's solution may be injected into the center of the mass by means of a small hypodermic syringe as fast as these lumps appear. Better allow your veterinarian to do this for you or at least show you how.

PERHAPS LAMANITIS—I have a mare that had a colt. They both seemed to be well that morning, and were up. Turned them out on grass and the next morning they were all right as far as I could tell. At noon the colt was lying down and at three o'clock it could hardly get up. A little later I noticed it had the scours. I gave it an egg and milked the mare; she had a lot of milk; it was running out. I put them in the barn; she seemed to be stiff. The colt did not seem to get any better; I gave it another egg as that was the best I knew. I stayed up with it and it kept getting worse. At about ten o'clock that night its mother was lying down; I made her get up so I could milk her in order to give the colt some milk. When she got up she panted like a horse in hot weather that had been working; the next morning she was so stiff she could hardly walk. The colt died. The mare was used to grass; had fed her corn and oats and hay all winter; had not worked any; it was her second colt. Will you tell me what was the cause of her being so stiff? She was very near well. Have heard of one man losing both young and old.—Missouri Subscriber.

REPLY—We suspect your mare was affected with laminitis, and as a result of her derangement the colt became affected through the milk. A mare that is diseased will frequently excrete enough poisonous material through the milk to kill a young colt. The proper thing is to at once remove the colt from the dam and attempt to bring it up on prepared cow's milk. Laminitis is no unusual condition to follow foaling.

STALLION EATS DIRT — What makes my stallion want to eat dirt? When I take him out of the stable for exercise or water he often delves his teeth into the dirt two or three times (if allowed) and will stand and chew the dirt with his front teeth? Please give remedy.—Texas Subscriber.

REPLY—Nearly all domestic animals will eat dirt if confined and fed highly on nutritious grain. They are living quite an artificial life and do not have an opportunity to procure all the elements the system needs. As a rule, the craving for earth is due to a desire for alkalies. Try mixing three-fourths parts of sifted hardwood or clean cob ashes with salt and keep before the animal in a small box constantly. As a rule this will satisfy the desire in a week or two.

ENLARGEMENT IN REGION OF POLL—I have a four year old colt which has always had a hard lump on his neck just back of the head stall of the bridle. This spring the lump seems to be growing larger and works back and forth through underneath his mane. He also runs at the nose part of the time. He has never been sick but once and that was last fall when he had distemper. The lump does not seem to hurt him any; he is a hearty eater and worker. I would like to know what causes the place on his neck, and whether it is liable to kill him or not.—Oregon Subscriber.

REPLY—If this colt has never been inconvenienced by this growth as you state, it is our opinion that the animal has a slowly developing tumor such as could probably be removed successfully by a skillful surgeon. The fact that it continues to enlarge should be sufficient reason for you to seek the advice of some one who can make a personal examination. You should not delay this matter.

STATE SANITARY REQUIREMENTS—Kindly inform me through the American Breeder where, when and by whom stock would have to be inspected to be shipped from Oklahoma to Southwest Iowa. Would they have to be inspected more than one time? Also the probable cost of same—Oklahoma Subscriber.

REPLY—Iowa requires all horses, mules and asses to carry health certificate, including Mallein test. Cattle for dairy or breeding purposes, health certificate including tuberculin test.

Hogs and sheep health certificate. Federal, state or assistant state veterinarians may make such inspection, also any graduate veterinarian whose certificate is endorsed by the parties having charge of live stock sanitation in the state where shipment originates.

RIDGLING COLT—I have a two year old standard bred stallion that is well built, in good condition, and is a good traveler, but has not swung his testicles. Would you castrate him or not? Will he ever be good for the stand? Is there any way of bringing them down? If so, would like to know.—Illinois Subscriber.

REPLY—It is quite likely that your colt will prove to be a double ridgling, especially if he has been well cared for and is developed as a two-year-old should be. It would not be a bad plan to give him the benefit of another year if he is a valuable animal, and if at the end of that time both testicles are not down, he should be castrated. He is, no doubt, defective in these parts or he should appear normal at this time.

NEW GROWTHS IN THE VAGINA—I have found mares with enlarged tumors, the size of a hen's egg, and larger, in the vagina near the uterus. It seemed that these mares were hard to settle. Is there any treatment for this infection?—Illinois Subscriber.

REPLY—New growths in any part of the genital tract have their influence on conception and frequently on the general health. Oftentimes these growths can be removed by surgical means, which point should be left to the judgment of a skillful veterinarian. There is no other way of successfully treating these growths.

CONTINUOUS ESTRUM—We have at present a valuably bred three year old filly which has been in heat regularly every day since last fall. She is troublesome to work that way. I have seen older mares that would stay in heat for a month or more without going out, also found it hard to settle mares that were that way. Can you please give the cause, and is there a treatment for such mares? Can they be settled in foal when they are that way?—Illinois Subscriber.

REPLY—It is quite likely that if a proper manual examination is made a diseased condition of the ovaries will be found. Such mares are very difficult to get in foal, and if too troublesome the ovaries should be removed. You need a skillful veterinarian on the ground to carefully examine this case and advise you what can be done.

IRRITABLE SKIN—My Morgan stallion had influenza about a month ago. We kept him blanketed some and did not groom and exercise him as I should and now he is rubbing and biting himself badly all over; rubbing his mane out; the hair is coming out in patches. I have sponged him with Kresole, 1 to 72, but it does not stop it. Please tell me what caused it and what to do for it. We vaccinated him and all the horses I had up and he is the only one that is that way.—Texas Subscriber.

REPLY—If this animal has recovered from the influenza to a point where it is safe he should be given systematic daily exercise. Grooming with soft brush and woolen cloths is in order. A run at grass with no grain for a short time would be ideal. A purge consisting of six or seven drams of aloes would be a good thing to lead off with. Give him one-half ounce of Fowler's solution mixed with a pint of bran three times a day.

BREEDING A TWO YEAR OLD—I have a mare colt that will be two years old about the first of May. Do you think she will be old enough to breed this year? If so, would it be better to have her bred by the capsule system than by the natural service?—South Dakota Subscriber.

REPLY—You do not state the breed of your animal, which has some influence on the advice given. Large, growthy draft types are frequently bred at the age mentioned and if such an animal is in the hands of a good care-taker frequently yields satisfactory results. In the road class where beauty of form is more a requisite, early breeding is not to be encour-

(Continued on page 16.)

UNFAIR COMPETITION?

To the American Breeder:—I would like to ask you a few questions in regard to a man we have in our town by the name of W. P. Smith. He is in the breeding business here. He went away from home last fall for a few weeks claiming to have attended some breeding school. Now he is claiming himself to be a graduate of some scientific breeding school and is making a great-to-do over it. He has built a big breeding barn and made a great display around here; has done lots of advertising; has cut prices and made a fool out of the people until a man with a good horse trying to stand him at a reasonable price—trying to make some money out of it—can't get any business. We have a company horse here that cost us $2,700 and would have to stand him at $20 to make any money. This man Smith, has a similar horse that he is standing at $10 and has a very good jack that he is standing at $8.00. He has a certain time to breed and it looks like a camp meeting around there. One of my neighbors told me that Smith had bred about 400 mares already; so you can see that he has the people bewildered in some way. Now what I want to know is whether this man, W. P. Smith, is a graduate of any breeding school or not, or whether there is such an institution. I have been told that you could give me the information we want.—Apache Horse Company, Caddo County, Okla.

W. P. Smith is a graduate of the Graham Scientific Breeding School and you are not alone in experiencing the kind of competition he puts up. This lesson is worth much to your community. The time is past when any one can profitably stand high priced breeding stock without any knowledge of the business. We have received many reports of this kind.

On first thought one might say that this school is a disadvantage to the breeders at large, but if this breeder can successfully breed a dozen mares with one service, why cannot others do likewise? The proper thing for this horse company is to employ a qualified man to stand this stallion—one who can breed a large number of mares at one service so as to make the price cheap enough to compete with the scrub stallions and jacks in that vicinity. It is safe to say that the scrubs in your section are not doing as much business as they have in other years. Mr. Smith is in a position to give value received, which is the thing required to permanently hold the best business. If this company will also prepare a special individual for such work that, too, would take some of the business away from the scrubs and give the farmers in that section an opportunity to use better horses for the same price a scrub would charge.

Most of the students of the Graham Scientific Breeding School are being heard from. They get a lot of practical knowledge that they cannot get anywhere else in the world. Dissecting of mares and other demonstrations are very valuable to them in more ways than one. During this school their minds are concentrated on the breeding subject. Each breeder is required to perform his part of the work, which means practical experience. The association with other men in the same line of business also has much value.

Our advice to you would be to subscribe for the American Breeder and to attend the Scientific Breeding School at the first opportunity. You will be to this disadvantage, however, that your company has waited until a progressive breeder has advocated scientific principles and has the bulk of the custom coming to his barn. But if you will get busy and co-operate with Mr. Smith you can draw business from a very long distance to your town and practically eliminate all the scrub stock in that section.

Breeders are beginning to learn the meaning of a diploma issued from the only recognized scientific breeding school in the world. It is evidence that the holder has attended such an institution and passed the required examination, and the standing of the school is such that the possession of this diploma is an actual aid to him in getting business.

A GOOD HORSE RAISING COUNTY.

To the American Breeder: I have gone nearly out of the stallion business for the last two years. Have four or five. There has been some trouble with mares foaling this spring—colts coming wrong and dead—more than usual. This location has generally done well so far as saving colts. No contageous abortion in this neighborhood.—F. M. Smith, Washington County, Iowa.

BELGIAN VS. CLYDESDALE.

To the American Breeder:—I see in your paper of May 5th, 1913, that G. S. Perkins of Peoria County, Illinois, makes some very strong claims for the Belgian horse as a show horse. I wonder if he ever read an account of the great International Live Stock Show which has been held for years in Chicago, Ill.? If he has not read these accounts I want to refer him to them and I want to ask him how many times a Belgian in competition with other breeds ever won a championship? Now get down your records and see where the Clydesdale was placed at these great shows.—J. W. Craig, Henry County, Ind.

ALFALFA AS A VIRGIN CROP FOR SAGE BRUSH LAND.

As a virgin crop for raw sage brush land, alfalfa stands foremost among the legumes because of its marked influence upon the growth and productiveness of succeeding crops. Sage brush land is usually rich in potash and phosphoric acid and poor in nitrogen (organic matter.) Alfalfa appears to correct the lack of nitrogen by the cultivating effect of its wonderful root system, but the belief that it adds large amounts of nitrogen to the soil for other crops is erroneous. Exhaustive studies have shown that although it is capable of manufacturing its own nitrogen when this element is lacking in the soil, it is also a great feeder on nitrogen and deposits very little excess of soluble nitrates. Therefore the beneficial effect of alfalfa seems due, not so much to the addition of nitrates, but rather to the loosening and penetrating effect of its roots, and to whatever organic matter may remain in the roots.

It should be borne in mind that while it can supply its own nitrogen, it must, as do other crops, get its potash and phosphoric acid from the soil. —H. P. Fishburn, Assistant Chemist, Idaho Experiment Station.

WHY IS THIS?

To the American Breeder:—Scrub stallions sire larger colts at birth than pure bred sires. To the owners of good mares that are having trouble with them at foaling time, and have to have a veterinarian take the colts, will say, breed your mares to the largest pure bred sire you can find. If you want the old mare to commit suicide, breed her to the first scrub stallion that comes around. I have kept a record for the last ten years on the obstetrical cases, and as a veterinary, stallion owner and a breeder, I am in favor of castrating every stallion not registered.—H. A. Alcorn, Adair County, Ia.

JUDGMENT OF AN "OLD HAND."

To the American Breeder: The capsule system is all O. K. I have some of the finest colts gotten that way that there is in the country and have settled mares that could not get in foal by natural service. I prefer the capsule system to all other methods of breeding. Have had 30 years' experience in horse breeding—H. L. Van Ornum, Sargent County, North Dakota.

CAPSULE SYSTEM A GOOD THING.

To the American Breeder:—I wish to state that I think the capsule system as taught by the American Breder, a good thing. I have tried it in a number of cases. I have settled mares that I could not settle at a straight service of horse or jack, and I also think the colts are just as good. I settled one mare with a capsule and she had a pair of twin mules.—E. J. Ruffhead, Ness County, Kansas.

THE NEW KANSAS STATE FAIR BOARD.

Geo. B. Ross of Sterling, Kas., well known to many readers of the American Breeder, has been elected president of the Kansas state fair board, created by a law passed last winter. A. L. Sponsler of Hutchinson, continues as secretary of the fair at Hutchinson, which was made the official state fair by this law. The other members of the fair board are H. S. Thompson of Hutchinson, T. A. Hubbard of Wellington, and the secretaries of agriculture and horticulture in Kansas, F. D. Coburn and Walter Wellhouse respectively. It certainly has been a long time since any Kansas fair has been backed by a board so representative of the state's best interests, and friends of the state generally are optimistic as to the future of its state fair.

Mr. Ross has been one of the leaders in the success of the Hutchinson fair so far. He was a member of the Kansas senate in the last legislature and is president of the state's board of agriculture.

USING THE BEST PREVENTATIVE.

To the American Breeder:—Enclosed please find 50 cents, for which send me another box of navel powder by mail at once. The first box has given us great satisfaction. We have not lost any colts from navel ill so far this spring.—Wm. Hildebrand, Tama County, Iowa.

What Is Such a Paper Worth?

To the American Breeder: I have been in the breeding business only three years and have read your paper only two years. Have gained knowledge enough to increase my per cent of foals from 33 the first season, 56 second season, and 70 the third year. This was the same horse, all seasons, and about the same territory, and from only natural service. I have gotten a lot of good information from the American Breeder and want to have it come to my new location in Saskatchewan, Canada.—J. S. Hanson.

THE AMERICAN BREEDER

With which is combined

THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and Modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE, Editors.

Published semi-monthly (on the 5th and 20th of each month) by the

GRAHAM PUBLISHING COMPANY, INCORPORATED,

225 WEST TWELFTH STREET, Kansas City, Mo.

BELL TELEPHONE, 4297 GRAND.

Chicago Representative,

JOHN D. ROSS, 712 Hartford Bldg.

All communications for this paper should be addressed to the American Breeder, or the Graham Publishing Company, and not to individuals.

Advertising Rates.

1 inch: 1 month, $5.00; 1 time, $2.80.
½ inch: 1 month, $2.80; 1 time, $2.00.
Rates for longer time or larger space furnished on application.

Subscription Price.

One Year, $1.00; Three Years, $2.00. In Clubs of Four, Per Year, $3.00.

When sending subscriptions, please state whether they are renewals or new ones. Always renew under the same name and initials as previously used, and at least two weeks before your present subscription expires, so that you will not miss any number. When changing your postoffice address, state the old address as well as the new one.

If you miss your paper please notify us at once and all lest copies will be replaced.

Entered as second class matter November 28, 1911, at the postoffice at Kansas City, Mo., under the Act of March 3, 1879.

FALL COLT SHOWS.

The owner of every good sire should arrange for a colt show provided the sire really produced good colts. If the product is not good a colt show should not be held but a new sire should be installed. Nothing advertises the good qualities of a sire quite so well as excellent progeny. There may be present a great many who do not know the value of a good colt, but in the ordinary community there will be some who are versed in better stock.

But the difficulty in holding a colt show is to get a qualified judge. We believe it would be a good plan for every one contemplating a show of this kind to write to the Animal Husbandry Department of his State Agricultural College and ask if a judge can be procured, and at what price. A good man can usually be had from one of these institutions who will give satisfaction; give some points on each colt as he places it and explain his reasons for giving certain positions. If several breeders would join and write to the college for a judge it might be possible for him to name a time when he would be in that section, so that the expenses on each would not be so great. This feature should be encouraged, for an individual of this kind can place the premiums where they should be, "without fear or favor."

Where several go together and arrange for a joint colt show much rivalry exists, and great care should be given this subject so that there would not be any "bad blood." These things must be taken into consideration when arrangements are being made for a colt show. When a show is given entirely by one man or firm the question of a judge is not so serious, but a fair and qualified man should be secured at all times.

If a colt show is to be held during the fall months arrangements should begin now to encourage the mare owners to make preparations in order to get the colts in good condition. It should be given at a time and place where many outsiders could see the result of better blood. The better colts and sires should be photographed at the show and given publicity through the local papers.

If a suitable instructor could be employed this would be an excellent time to give a series of lectures and demonstrations on scientific horse breeding.

THE STAND AND SUCK PROBLEM.

There is perhaps no other thing that interests every breeder as much as the terms upon which breeding stock is kept. Every intelligent man knows that when a stallion or jack has deposited live spermatozoa in the uterus of a female, the stallion owner has really done his part. We have studied this subject very carefully. Organizations to regulate terms have been investigated, most of which have been failures so far as terms are concerned. The method of insuring the colt to stand and such is so well established in this country that we do not believe it can be changed. One county in Iowa organized for this special purpose and a majority of the owners of the best stallions kept faith with the agreement, but those owning inferior and scrub stallions left the organization and made capital of the combination. The scrub stallions in that county did more business that year than they ever did before. Several of the owners of good sires who adhered closely to the agreement went out of business. A dozen new stallions were purchased by the mare owners. This particular county organization kept the agreement as well or better than any county organization we have known.

There are so many men who handle inferior stuff that will insure the colt to live any length of time that it will be difficult to ever get away from the method of insuring the colt to stand and suck.

There are those who insure the mare to be in foal only, but this plan is not followed out, as a rule. When a mare has a colt that does not stand up and suck the owner of such colt makes a pitiful plea on the ground that he is paying for something without getting it; that he did everything he could and that it might be the fault of the stallion or some other cause, to the extent that the owner of the stallion frequently informs him that if he will pay for the colt he will give him another foal, so that in the end he is not ahead very much. Nearly every stallion owner will give in to a talk of this kind. But on the other hand he is losing some very good business because his competitor is insuring the colt to stand up and suck. If anyone can suggest a plan by which better terms can be adopted, we would like to know about it.

Every breeder should be the proprietor of his own establishment. If an individual should present mares for service that will not be properly cared for they should be refused service. This, of course, will make an enemy, but it might set a good example in that community. It is not necessary that a breeder solicit a hazardous risk. The advertising might have a line in it as follows: "Only mares receiving humane treatment will be bred."

Breeders who are striving to improve the stock of the country are the ones whom the public should encourage, and until the public is better posted on blood lines and individuality, the scrub stock will make a harvest on the stand and suck problem. There is, however, an avenue of escape for the owners of good sires. Since it has been found that the semen can be kept in good condition for several hours, the price can be made cheap enough and the colt guaranteed to stand and suck and thus meet all competition.

The "cash in hand" system looks reasonable, but there are men engaged in the horse business who are not very proficient and the mare owner has a right to know whether the operator is qualified to get his mare with foal. There are cases where stallions have made many services in a day on the "cash in hand" plan.

These questions are all debatable, but if the writer was engaged in the breeding business he would insure the colt to stand and suck and make the service fee reasonable and use modern breeding methods. This plan will improve the stock and develop the business on a permanent basis. The best permanent business is based on giving value received.

STALLION AND JACK LIFE INSURANCE.

We have received numerous letters from breeders urging us to suggest a plan by which owners of stallions and jacks could form a mutual life insurance company that could be maintained at actual cost without having so many high priced officers and paying such large dividends. Some have stated that they have spent their money and received nothing in return when a loss occurred.

We believe that such an organization could profitably be started and would result in an organization that would mean something to the horse breeders of this country. Those who own valuable stock feel that they need some protection, but the rate should be reasonable and the company should be on a solid basis so that the losses could be promptly paid in full.

Some months ago we tried to interest the draft horse breeders in starting an insurance company of this kind. This subject has been brought up several times at the Scientific **Breeding School in this city,** at which most of the students are in the breeding business, but nothing has been done. We should like to hear from breeders over the country suggesting a plan for an organization of this kind. The American Breeder will be glad to give an association of this kind such publicity as should make it a success if it is founded on a substantial basis, and is intended for real insurance for the horse breeders of America.

At the present time the insurance business in this line is not very satisfactory. We contend that 10 per cent is too expensive—that it ought to be carried for less money. We also contend that there are some companies that should not be patronized. We believe that the breeders should be interested in this proposition.

GETTING MORE COLTS.

The object in keeping stallions and jacks for service is to get good, live foals and to make a good sire produce as many of the right kind as possible. It has been found by practical experience that two services a day and one the next is sufficient for any sire during the busy breeding seasons when natural service alone is employed. The number of mares for a stallion is frequently too large to be accommodated by this number of services, and more especially during a very short breeding season. The bulk of the mares are bred during a period of six weeks or two months, and when this rush of mares prevents breeders from giving some customers a service within a reasonable length of time it quite frequently causes the owners of the mares to patronize inferior stock.

In overcoming this difficulty many breeders have taken special advantage of the new method in capsule breeding by keeping the semen for several hours. This can only be successfully done with the new improved Carlson semen extractor with the point protector. After a mare has been bred the semen is extracted and left in the extractor. The new point protector has a cut off valve so that it can be screwed down and closed. This will keep the water and the semen from mixing; then the extractor can be immersed in a pan of sterilized water which should contain a tablespoonful of salt to one gallon of water, boiled in the water. Several gallons of water should be boiled with the salt in it and put in large jugs to cool. The extractor should be boiled each time before using. The galvanized pan, which should be 40 inches long, eight wide and six inches deep, should have two small lamps under it and if possible this should be kept in a room so that the temperature can be maintained more satisfactorily. Before the service is made the water should be 100 degrees and the small lamps should be regulated under the pan so that this temperature can be maintained for several hours. A thermometer should be kept in the water so that one end of it is sticking out in order to read the thermometer without taking it out.

After the semen has been extracted from the mare, and the extractor containing it is placed in the pan, then the operator can wait for the other mares to come in. When an additional mare is presented and examined and found satisfactory the operator and the mare owner should wash their hands thoroughly. The mare owner then holds the extractor and fills the capsule. After the capsule is filled the mare owner tightens the valve and puts it back in the water. The operator inserts the capsule and waits for another mare. Great care should be taken, however, to see that the temperature is kept exactly right and that the semen does not get above 101 degrees or lower than 95 degrees. This is very easily regulated with the small lamps. All the water used should be sterilized by boiling.

Every breeder who expects to use the capsule system next year will find it an advantage to breed a few good mares with capsules this year if possible, so he will have some colts to show, or at least show that mares are in foal for the next spring season. One colt will pay all the expenses of this arrangement. A little practice at this time of year will be very profitable. A proper temperature will be more easily maintained after the operation has been performed a few times, which will give the breeders more confidence when this method is used later on a large scale.

The capsule method of breeding has come to stay and every breeder who expects to stay in the business must meet it sooner or later as open competition, and the first one who adopts this system successfully in a community will have a start in the business. Before the next breeding season thousands of farmers will be calling for the capsule system.

PUBLICITY VS. PASSES.

Every few years some officer connected with some state fair or live stock exposition gets worked up over the idea that the agricultural papers are receiving too many complimentary admissions to his particular live stock show. Some of these officers are entirely honest in their belief, having no conception whatever of the value of the free advertising which has been given to their affairs by the papers they are seeking to restrict. Others, who have paid out thousands of dollars in advertising their own business, know better and as a rule their counsel prevails when this question is brought up for discussion.

We have yet to see the agricultural fair or exposition which has suffered or lost money in any way as a result of giving free admissions to the edi-

torial and advertising men on the farm papers. In the case of nearly all the better agricultural papers in the corn belt, the space given to news and other publicity concerning the fair is worth many times over the full cash value of admissions for every member of the newspaper force as often as he would have time to attend.

The only real ground for complaint which the fair managements have ever had has come from an abuse of privileges on the part of circulation departments. There have been cases where circulation managers have secured a large number of passes and with the aid of these have proceeded to infest the fair grounds with gangs of subscription solicitors armed with premiums and false promises sufficient to make nuisances of themselves. However, this evil has been pretty thoroughly corrected, subscription solicitors being required by some managements to pay for concessions and keep within the same just as other concessioners do. The question then simmers down to whether or not a big state fair, which will get an average of a thousand dollars' worth of publicity from each of the leading farm papers interested, can afford to give them admission privileges which would cost from $5 to not over $100 each at the very outside. Naturally, the papers are not greatly concerned, in a financial way, as to what course the few disgruntled fair managers may pursue.

PARTIALLY PERSONAL

Otto Barth, until recently advertising manager of the Kansas Farmer, has resigned and is now handling the advertising of the Witte Gasoline Engine Company of Kansas City, Mo.

Nothing sells like a new thing. The other day the town of Elkhart, Kas., was started at the end of a railroad being built through the "short grass" and in a one-day auction town lots amounting to $30,000 were sold.

Dr. Cutler has resigned his job as Dairy Commissioner in Missouri to become secretary of the American Association of Manufacturers of Products of Corn. The news dispatch, being telegraphic, did not give the association's full name.

The Kansas City boat line carries considerable grain and live stock, although it was established primarily for shipping merchandise, construction material, and so forth. One boat recently left the dock at Kansas City with 40,000 bushels of grain for St. Louis.

"I sea by the paiper," says Hy Geer, "that some Juse in Yourup let thare town burn up wun Sabbuth becus it wuz agin thare religun to fight fighr that day. In thiss kuntry ever day must be Sabbuth fer the Juse."

A large number of papers and people are showing the balance of the country, by means of statistics, how it is that decreasing cattle production is responsible for high beef. The explanation that seems to be lacking is, "What does this country propose to do to make it worth while for the farmers and stockmen to raise more cattle.

I. D. Graham of the Kansas Farmer staff and author of the "Gems of Thought" which accompany the drawings by Manager Albert Reid on the paper's front cover, has been made secretary of the International Cattle Company of Chicago and Morrison, Ill., Kansas City, Mo., and Olivet and Topeka, Kas. This will take the bulk of his time, although he will still do some work for the Kansas Farmer.

AZOTURIA IN HORSES.

To the American Breeder:—Azoturia is a disease of horses occurring in the spring after they have been worked hard and fed liberally and the feed is not reduced while they are idle. The disease often makes its appearance in the form of colic, the patient rolling and tumbling and the owner, not recognizing the affliction, urges the animal to move in order to get it home that it may receive proper medical attention. The disease is not recognized while the animal remains idle but after moving it for a quarter or half a mile the patient sweats profusely, becomes stiff, usually in one hind leg, and if compelled to keep moving, will fall in the harness. Muscles over the affected limb or limbs are hard, the breathing is labored, and if urine is passed it will have the color of strong coffee. If the front legs are affected, stiffness in front is very pronounced, the muscles back of the shoulder become greatly enlarged, are hard and the horse walks lame.

The large majority of cases of azoturia, if recognized at the outset, require no medical attention. Stop the horse as soon as the above symptoms appear, cover with a blanket and leave standing absolutely quiet for one or two hours. Then take the animal home and give him two quarts of a sloppy bran mash and a small amount of hay. Feed carefully for several days and the horse will make a complete recovery. Failing to recognize the disease, the symptoms become more pronounced, and it is not until the horse is about ready to fall that many drivers really think that their horse is sick. At this stage of the disease the patient should be well covered with a blanket to prevent chilling, and a competent veterinarian called who will draw the urine and give eliminating drugs. If the patient makes a struggle to get up sufficient help should be available to assist him as most horses, after struggling, lose courage and will not try to get on their feet. One should avoid moving the horse from twelve to twenty-four hours after a severe attack as the exercise aggravates the disease.—C. L. Barnes, Colorado Agricultural College.

The James Milliken University

A Christian College, offering full Classical and Technical Courses. Seven fine new buildings, including ladies' dormitory, all with modern equipment. Co-educational. Superior Faculty. Expenses Low. Over 1000 students last year. For catalog, address,

A. R. Taylor, President, Decatur, Ill.

BEFORE YOU GO TO

BUSINESS COLLEGE

I want to talk to you either personally or by letter. I want to tell you what I will do for you. I want to tell you something of the aims, aspirations and ideals of my institution, and the work I am doing for **better business training.** I want to tell you how I will help you. No matter where you live—no matter what your financial condition. If you are earnest, ambitious, honest and really want to learn **Shorthand, Typewriting, Bookkeeping, Penmanship, Salesmanship** or other **Commercial Branches,** write me today for my **new catalog** and let me tell you how I can help you realize your ambitions on terms to suit yourself. Students assisted to a place to work outside of school hours for room and board. Address me personally. **C. W. RANSOM, Pres.**

911 Minor Bldg., 10th and McGee,
Kansas City, Mo.

THIS CARE SAVES COLTS.

To the American Breeder: One can not give too much care to the mare and foal, as I think the horse is next to a human being, and should be handled accordingly. See that the colt's bowels move in an hour or so after it is born; keep the stall clean and well bedded for at least a week. Hay is none too good for a bed—better than moldy straw. I have raised 14 in the last five years and have my first one to lose. Always work my mares and am careful about getting them very warm. Don't trust to luck. See that the proper thing is done and you will win.—John Cashen, Buchannan County, Iowa.

FIRST LESSON IN FREE BEEF.

"Father, is Beef High?"
"Yes, Son."
"Why?"
"Because Cattle became Scarce, for One Reason."
"Why did Cattle become Scarce?"
"Because for a Long While there was not Enough Profit in raising them."
"Is there Profit now in Raising Cattle?"
"Yes, Son."
"Is the Number of Cattle Increasing?"
"Somewhat."
"When will the Number become Sufficiently Increased to make Beef less Dear?"
"Immediately after the Passage of a Tariff Bill which will Knock the Profit out of Cattle Raising—of Course. And incidentally, the Fertility of our Farms will also be Increased by this Wise Provision."

YOUR SON AND DAUGHTER

Will enjoy the summer in the OZARKS. Why not let them attend a practical business training school this summer and fall, where the climate is worth the money? Training for business or position. If interested investigate.

Fayetteville Commercial College, Fayetteville, Ark.

SHORTHAND IN 30 DAYS

We absolutely guarantee to teach shorthand complete in only thirty days. You can learn in spare time in your own home, no matter where you live. No need to spend months as with old systems. **Boyd's Syllable System** is easy to learn—easy to write—easy to read. Simple. Practical. Speedy. Sure. No ruled lines—no positions—no shading, as in other systems. No long list of word signs to confuse. ONLY NINE CHARACTERS to learn and you have the entire English (or any other) language at your ABSOLUTE COMMAND. The best system for stenographers, private secretaries, newspaper reporters, lawyers, ministers, teachers, physicians, literary folk and business men may now learn shorthand for their own use. Does not take continual daily practice as with other systems. Our graduates hold high-grade positions everywhere. Send to-day for booklets, testimonials, guarantee offer, etc.

AMERICAN BREEDER'S SCHOOL (Horse Breeding LESSON IV)

Causes of Disease

This is one of a series of lessons prepared expressly for the thousands of our readers whose business requires thorough, systematic instruction on breeding subjects, but who so far have been unable to get away from their homes to take, personally, a regular course of study in a breeding school. These lessons do not in any sense constitute a "correspondence school"—they cost nothing to our subscribers and no "diplomas" are given. We are simply going much farther in the direction of careful, practical instruction on an important but difficult subject, than any agricultural publication has heretofore thought of going, knowing that such a series of articles, if properly studied, will be very valuable, both to those who follow it later in a regular school, and to those who cannot. As a feature, or department of this paper, therefore, we offer the "American Breeder's School" to the thousands of breeders on our lists who seek advancement in their business. As long as our supply lasts we will send the issue of April 5 (which contained the second lesson—"Generative Organs of the Female")—to every new subscriber who requests it. One dollar for a year's subscription to the American Breeder is all we ask any one to pay for the full series.

It is our intention in this lesson to discuss some of the causes of disease with hints on how, in our work, we may be able to recognize disease; how we may understand the manner in which it spreads and how we may avoid being instrumental in its dissemination and in that way do effective work in our attempts toward improved breeding.

Very few of us realize that the chief causes of the several ailments that man and animals are affected with, exist in forms so small that the most practiced eye fails to discover them. It is only since powerful magnifying glasses or microscopes have been developed that we have been able to see what is really the actual cause of the several disease that are met with.

It has been found, and repeatedly proven, that the chief cause of nearly all our sickness exists in low forms of vegetable life, organisms so small that it requires the most powerful lens to discover. Unquestionably there are many organisms that are responsible for disease that cannot be seen at all.

Not all micro-organisms are capable of producing disease. There are many that are known to be harmless. There appears to be no doubt, however, that a harmless germ may, under certain conditions of growth, become disease producing. On the other hand certain germs that are extremely virulent and capable when gaining access to the body of producing death in a few hours, may, by certain methods employed in their growth, be made entirely harmless.

Again, the physical condition of the body has much to do with whether or not disease will manifest itself.

Should the body be in a state of high physical vigor, then germs that ordinarily are disease producing may have no effect, while at another time when the physical state is at a low standard, these same germs might cause great illness and even death.

The lowering of vitality and resistance appears to not only open the way for disease producing germs, but these same germs seem to thrive and wax more virulent on the fluids of such a body. No doubt our methods and practices of civilization are greatly responsible for many harmless germs becoming virulent. Opportunity for growth in altered and changed fields causes them to assume disease producing properties and we are to be reminded that this state of affairs is increasing. It is largely through this condition that new diseases develop and attract our attention.

Scracely a season passes but what either in man or animals we learn of the outbreak of some disorder whose nature and cause is not understood. These disorders spring up and often large areas become involved.

Changes occur which makes less favorable the growth of the germs and the disease subsides and may not be heard of again for years.

The secretions and excretions of the body supply a very favorable soil or field in which germs may grow, and we might say that our bodies are fairly permeated with some form of germ life. They exist in harmless forms and disease producing forms, and whether or not we shall suffer from physical ills depends in a great measure on our bodily resistance. Certain organisms seem regularly to inhabit certain parts of the body and in their proper place are really beneficial. On the other hand, the presence of some other form of germ life in that part would mean disease. Some germs are capable of producing disease in a body only once. As an effect of such disease there seems to be changes take place so that ever after that particular body will not contract the same disease again. We speak of such a condition as an immunity. Some people and animals enjoy a natural immunity against certain diseases. For instance, hog cholera is a disease of swine, other animals do not have it; black leg is a disease of cattle; influenza is largely a disease of horses. Tuberculosis, on the other hand, affects nearly all animals and includes the human race.

We are to recognize that germs are present everywhere. Our bodies are filled with them and they clothe our exterior. They are adherent to all kinds of objects. We can touch nothing that is not covered with them.

A fly may be permitted to walk over a sterile plate of culture media and in a few days thousands of germs will be found growing at the very point of his every foot step. Germs abound on everything and are moved largely from place to place by particles of dust that are set in motion by air currents. An atmosphere free from dust is comparatively free from germs and the danger of breathing in germs and causing disease in that way is not regarded of so great importance as once held. On the other hand, the germ ladened food that finds its way to our mouths is no doubt, a far greater cause of disease than the fewer number that gain entrance through the respiratory tract.

With the knowledge that our persons, also the instruments and appliances we are to use in our work, are germ ladened (and we do not know what proportion of the germs may be capable of producing disease if introduced into certain parts of the body), it behooves us to take such steps as will insure the destruction of all the germs that may be adhering to any instrument we may choose to use. It has been found that a certain class of chemical agents are capable of destroying germs of all kinds. In order to do this, however, effectively, the solutions have to be made so strong, and the parts that are to be disinfected have to be saturated so long with the solution that it makes the whole matter rather impracticable excepting for certain purposes.

Perhaps the most practical and successful way of destroying the germs that may adhere to the instruments is by means of moist heat. No germ can survive boiling for any great length of time. By boiling the instruments to be used for ten or fifteen minutes, one not only frees them from dangerous germ life, but has on hand besides a sterile liquid to keep them in or use for any purpose wherein it may be needed in the breeding work. The man that is to do the work cannot very well boil himself, but he can put on a clean oversuit that has been boiled. With his sleeves rolled high he can scrub his hands and arms with a nail brush that has been scalded, using water as warm as he can stand and using plenty of good soap. The operator's nails should be kept closely trimmed and each time after washing he should carefully rinse off the hands and arms in the water made sterile by boiling. During his work he should be very careful about permitting his hands or arms to touch contaminated objects, remembering that all objects not previously sterilized are contaminated.

If he is to examine several mares he should have the external genitals prepared by an assistant with warm water and soap, and finally rinsed with sterilized water.

The mares should be examined in the order of their apparent health or soundness, as indicated by external conditions, beginning with the apparently most healthy. The operator should, as a matter of precaution, thoroughly wash and rinse his arms before making each separate examination. Did he not do this he might be as great a factor in spreading disease and barrenness as the stallion that is allowed to serve mares promiscously. Mares that do not conceive readily when it is known not to be the fault of jack or stallion should be very carefully examined. It is here that the stallion owner has much to learn, yet if he will be a student and apply himself as diligently as he would in any other undertaking in which he expected to succeed, many of these perplexing and mystifying problems would be cleared up. Every keen observer will soon be able to detect the difference between a natural and an unnatural discharge from the genital tract. It will be noted that the natural discharges are closely associated with estrum, and that the abnormal ones are more continuous. This latter fact may not be always observable from the fact that when the uterus alone is involved the fluid may be retained and only be thrown off periodically. There is many a sterile mare that apparently is in the very pink of condition that fails to breed because of an infection of the uterus. Many of these cases give no external sign of disease, but if the hand is carefully introduced into the vagina, and two fingers passed through the cervix, turning the hand with the palm upward, and bearing down firmly, it will be found in a great majority of these cases, upon withdrawing the hand, that it is filled with a fluid that is the result of disease. The admixture of virile spermatozoa with this fluid, and observing what results under the microscope will convince any man of the folly of breeding such a mare in her present condition.

We hope our readers will not be instrumental in promoting this class of cases through either carelessness on their part in making examinations or cause a spread of the disease through the stallion direct.

Having read carefully through this lesson, one or more times, the student should now ask himself the following questions and find the answers thereto in the preceding lesson:

1. What is the chief cause of disease?
2. What agency has been chiefly instrumental in determining this fact?
3. Are all germs disease-producing?
4. How might a breeder spread disease in examining and breeding mares?
5. Would you advise letting a stallion serve a mare that shows a discharge?
6. How would you determine the presence of an unhealthy secretion in the uterus of a mare?
7. How would you avoid transmitting infection (germs) from this mare to the next one you examine or breed?
8. Why should we look upon all objects as contaminated unless they have just been sterilized?
9. Would it be safe to use in breeding, any instruments or appliances that cannot be boiled?
10. Prepare a list of the changes you will make about your breeding barn, as a result of the suggestions this lesson contains.

PERCHERONS

Eleven home grown 3 year old stallions, exact weight 1,840 to 2,090 pounds. Bone to spare. June 5th these and youngsters for sale. The BIGGEST Percherons pay you best. Drop a card for details.

FRED CHANDLER,
Route 7, Chariton, Iowa.

GOOD IMPORTED SHIRE

Stallion; 10 years old; black; a state fair winner; sound; right every way; extra good breeder; weight 2,300; sell for no fault; $1,000 to a quick buyer.

O. I. C. pigs, White Wyandotte and Black Langshan eggs for hatching at $1.00 for 15 or $5.00 a hundred.

W. H. Schnelle, Lemonville, Mo.

BELGIAN STALLION

ROAN IMPORTED BELGIAN STALLION for sale; 11 years old; weight 2,180 in fair flesh; good breeder; heavy boned. Lots of colts to show. Reason for selling, want to quit the business. **Harry Pahl, West Side, Crawford County, Iowa.**

CLYDESDALE HORSES

Stallions and mares of all ages for sale.

Also Shorthorn Cattle.

W. A. DeMerritt

Route 2, Plainfield, Ill.

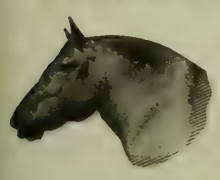
Draft and Coach Stallions

A fine bunch of Percheron, Belgian, French Draft and Coach stallions for sale; priced from $350 up. I have the big ton kind that are right. Come and see me, or write. J. M. Nolan, Paola, Miami County, Kas.

PERCHERONS.

Imported and home bred stallions and mares, from $200 to $900 each. **Ed. Redenius, Rushmore, Nobles County, Minn.**

D. K. ROTH



GIBSON CITY, ILL.

IMPORTER AND BREEDER OF BELGIANS AND PERCHERONS

Not How Many, But How Good.

Square Dealing My Motto. Write Me Your Wants

"AMERICAN BRED PERCHERONS"

Anthon 25137 (45446) by Besique (19602), at head of herd. We have on hand several fillies and stud colts sired by Gouveneur 55328 (70200), for sale. Also a black stallion of fine quality coming three years old in July, for sale. Come and get a colt where you can see the sire and dam. Onarga is eighty-four miles south of Chicago on the I. C. R. R., and about seventy-five miles east of Peoria.

H. KNOCHE & SONS, Onarga, Ill., R.F.D. No. 2

R. L. HARRIMAN, Bunceton, Mo.

The Fine Horse and Jack Auctioneer of the West

I sell more horses and jacks than all others. Terms always right: work always up to the highest standard.

WHITE OAK STOCK FARM

American bred Percheron Stallions and Mares.

The best to be had of the breeder—can show sires and dams of most of them. Always a large number to select from at reasonable prices, considering the kind of stock. Address your wants to **D. Augstin, Carlock, Ill. R. F. D. No. 2.**

Carlock is on the L. E. & W. Ry., and thirty miles southeast of Peoria, ten miles northwest of Bloomington, Illinois.

PERCHERON, BELGIAN AND COACH STALLIONS AND MARES, ALL AGES.

100 head to pick from; size, quality and breeding. We won over 50 first and second prizes and gold and silver medals at the Wisconsin State Fair. Grand Champion Belgian and Percheron stallion at head of stud. Prices and terms to suit. **Ives & Bellman, Delavan, Wis.**

IMPORTED AND HOME BRED STALLIONS AND MARES.

PERCHERONS, BELGIANS, SHIRES.

The best importation we ever made is now in our barns ready for inspection. The mares include some of the best fillies that came out of the Perche this year. See what we have before buying elsewhere. **Address Hart Bros., Osceola, Iowa.**

AT QUALITY STOCK FARM.

Full blooded registered stallions for sale from one to three years old. Sires and dams are imported prize winners, the wide out, heavy boned kind, with plenty of quality. All will make ton horses or better. Also one imported Belgian stallion, weight 2080; six years old. A great breeder. Plenty of colts to show. **E. A. Silverthorn, Rossville, Clinton County, Ind.**

REGISTERED STALLIONS.

Four Clydesdales and one Percheron coming two years old; all big fellows with plenty of bone and quality.

John H. Chambers, Edinburg, Johnson County, Indiana.

Stallions and Mare

For sale. One 4-year-old Percheron mare with stallion colt; one six year old Percheron stallion; no kin. Price $1,000 f. o. b. Reference, American National Bank, Paris, Tex.

J. J. Tschudy, Blakeney, Texas.

REGISTERED DRAFT STALLIONS and mares for sale; mostly Percherons. Also road stallions, mares and colts. Prices to suit. **E. P. Hamilton & Sons, Garden Grove, Decatur County, Iowa. R. F. D. No. 2.** (Station, Leroy.)

SEES NEED OF LIEN LAW.

To the American Breeder: I appreciate your paper very much and read it regularly, especially the lessons on capsule breeding. I have two stallions, and the Percheron is only a young horse, and I am thinking of using the capsule system next spring. I have been in the horse business for ten years with two or more stallions that are sure foal getters, yet I think the per cent of foals too small. If the horse men would attend to the good mares and let the doubtful ones alone, instead of trying to get the largest number of mares on the books, there would be a better per cent with foal. In regard to collection of service fees, I think we ought to have a lien on the mare and colt for eighteen months after the last service, for if we breed to insure with foal (which is the only way to breed), we have no laws to protect us from the "dead beat" at all.—V. J. Gross, Kossuth County, Ia.

NEW SYSTEM DEMONSTRATED AT HEAD'S ISLAND GROVE FARM.

On Tuesday morning Island Grove farm of W. T. Head was the scene of a gathering of horsemen, anxious to see a demonstration of the capsule system of breeding. There was a collection of horses there that the Waynestown horse show will have hard work to equal. Mr. Head's two sires were looked over and complimented by all.

Jambier, the imported Percheron, is a splendid dappled gray and he has many friends among the wise ones.

Abbott's Haymaker is the Shire horse, a fine, up-standing brown fellow, with three white feet, weighing better than a ton and carrying his weight lightly and easily. He shows plenty of power with his size, fine muscles and heavy bone. He found plenty of admirers among those present.

The demonstration was conducted by J. A. Hart, the Indiana representative of the Truman farm, Bushnell, Ill., of which farm Mr. Head bought both his horses. He is a graduate of the Graham School of Scientific Breeding at Kansas City, Mo., and his work showed that he knows his business thoroughly.

The occasion was both interesting and instructive, and all knowledge that can be diffused on lines of breeding for better horses is of value to the entire community. — Pittsburg (Ind.) Sun.

STALLION AND SILO SUGGESTION.

To the American Breeder:—I have a registered stallion. Some of my neighbors prefer to pay $8 or $10 for a scrub to $20 for registered stock, but after I have a few colts to show think they will wake up.

Your article on silos in April 20th issue is fine, but you fail to state that the higher they are the more power needed to deliver. For instance, I have a six horse power gas engine on my place that would deliver for a 20-foot silo but will not for a 30. I need a silo in summer; can pasture wheat, oats and rye all winter, but have to work every acre in summer except the woods lot.—L. H. Barry, M. D., Garland County, Ark.

USESUL INFORMATION FROM THE EXPERIMENT STATIONS

Many inquiries come to this office for information on subjects we cannot treat fully in the space available. In order to help these inquirers in the best way we can, we will try to publish lists of bulletins now offered for free distribution by the experiment stations from the states from which these inquiries come. We give herewith lists from six of the states and hope to have lists from other states later. The Colorado station sends bulletins free on application to parties within the state; the other stations, so far as we know, will send them anywhere so long as the supply lasts. We have listed only such bulletins as we thought most likely to be of interest to our readers—omitting many on such subjects as horticulture, gardening, and some crops not essential to stock farming.

In writing for bulletins, use the address given at the bottom of the list in which the desired bulletin occurs, and give both the title and number of the bulletin.

Colorado Bulletins.

PARTNER WANTED.

I am a competent veterinarian and experienced live stock farmer, and offer my time and services in the management of a stock farm, horses, mules, cattle, sheep or hogs, depending on locality. Make me a proposition. I own a full blooded Morgan and two of the best draft stallions in my county. **W. B. Black, V.S., Osakis, Douglas County, Minn.**

FOR SALE OR TRADE.

One Standard and registered stallion; dark bay; 6 years old; perfectly sound and right, and of the most fashionable breeding. Weight 1,100 pounds.

Also one black Mammoth jack; 8 years old; 14 hands standard. One of the wide out, bloeky kind with lots of quality; 7½ inch shin. Will sell or trade for registered draft stallions or mares or mules. **C. E. Hodgden, Galesburg, Neosho County, Kas.**

REGISTERED MORGAN HORSES.

My Morgans ars large; 15 to 16 hands and 1050 to 1300 pounds; have clean, heavy bone and possess all of the style and endurance for which the breed is noted.

For Sale—Weanlings to 3-year-olds, by The Admiral 4871 A. M. R., he by Jubilee De Jarnett. Send for catalog. **Richard Sellman, Rochelle, McCulloch County, Texas.**

$600 BUYS

The Rex Denmark—Black Squirrel bred saddle stallion, REX KNOX 3115. Black; 15.2; five years; sound. A great acting show horse and sire. Fearless under saddle and in harness.

Also the ladies' beautiful saddle mare, MANCELONA II. Bay; 15.1; four years; sound; eligible to registration; safety city broken to saddle and harness and suckling fine foal by Rex Knox. Destruction of my barns by fire makes this sacrifice imperative. **W. T. Wilkinson, Eureka, St. Louis County, Missouri.**

WANTED—SADDLE HORSE.

I have a customer for a good saddler. Must be gentle, sound, a good looker, of easy gait to carry rider of 190 pounds. Address **John Dalton, 235 South 26th St., Lincoln, Neb.**

EXCELSIOR SHETLAND PONY FARM.

Registered stock a specialty; a limited number for sale. W. H. Fulcomer, Prop., Belleville, Republic Co., Kas.

a few chickens, a dog and a cow. Fence nice little garden; plant some flowers; paint the house and buildings and make things look cheerful and homelike. Then look around the neighborhood and see if there isn't some nice young lady. There is one somewhere in this great big world that would like to go partners with him and keep him from getting lonesome and drive away the blues. If he doesn't find anything to his liking, tell him to send to Sears-Roebuck, Chicago, Ill. If he doesn't find one there, tell him to call on me.—Wm. Thornton, Tazwell County, Ill.

STALLION LAW SHOULD HAVE TWO SIDES.

To the American Breeder: There ought to be some law in regard to holding a mare for the service fee before the colt is born, as lots of people move before foaling time. I think the rigid stallion law all right, but it ought to give the stallion man a better collection law in regard to mares moving before foaling time.—John Doming, Hancock, County, Ia.

SUCCESS RAISING RANGE MULES.

To the American Breeder:—I have been reading the article entitled "Mule Breeding on the Range," and beg to disagree with the Montana breeder in regard to mules being successfully raised on the range. I have been in the horse and mule business for twenty-seven years and have run them on the range all the time. There are dozens of breeders in this locality that are raising 60 per cent or better of mules from range mares—mares that don't average being fed more than one month out of twelve, and are bred in chutes. It takes time and experience to learn how to handle a jack properly, but it is a paying proposition.—E. W. Wilkerson, Klamath County, Oregon.

A PLACE TO DISCRIMINATE.

Only a few breeders realize the great extent of the American mule industry. About one-fourth of the mares in the United States are bred to jacks. Mules in the open market represent more money per head than any other domestic live stock. Yet only a few men have paid any attention to the problem of producing the good, big, rugged mules which are bringing the highest price.

The average breeder has many queer notions about selecting a jack. Some of them contend that the breeding of mules is an accident—that one jack will get just as good a colt as another. There are in this country over 4,000,000 mules. The value of these mules could be nearly doubled if a better selection of jacks was made by the farmers, but it is impossible to breed all the mares to good jacks, under the present system in vogue with jack breeders. There are a number of breeders who are using modern methods and supplying a large territory with good jacks. Many more breeders could study this method of breeding to a good advantage. There is a great scarcity of good, big, rugged jacks. The demand for good ones will surely increase because mule breeding is very profitable.

BARGAINS!

I am cleaning up my stock of Big Jacks and Draft Stallions

And am making the lowest prices you ever heard of for stock as good.

Just come here, pick out what you want and if you don't buy it won't be the fault of the price.

I don't believe in having any good, serviceable stock left when the season ends, and this is the way I keep from it. Come and see.

W. J. Finley, Higginsville, Mo.

REGISTERING JACKS AND JENNETS.

The Standard Jack and Jennet Registry of America, has made such remarkable progress that we believe it is advisable to make the rules more rigid. This probably will be done in the near future, as the officers of this association are progressive jack breeders who believe in improvement. It is quite likely that this change will be made within the next few months. Those who expect to patronize this association should send for application blanks and register their stock while they can. Jack buyers are demanding certificates from this association and we believe it is advisable to attend to this work in the near future. It does not take long to measure the stock and send them in for record as foundation stock. No doubt there will be many who will be disappointed after these rules change and their stock will not be admitted.

This association is incorporated and is one of the most rigid record associations in existence. Every application requires a sworn statement. One share of stock costs $10, and its

U. G. SAUNDERS OF KENTUCKY, One of the State's Leading Breeders, and a Director in the Standard Jack and Jennet Registry of America.

purchase makes the buyer a member of the association. All members can register their stock for half price—$1.00 for members; $2.00 for non-members. The membership has grown very rapidly until this association has many of the best jack breeders in the country as stock holders.

Application blanks may be had by addressing Wm. E. Morton, Secy., 920 Scarritt Bldg., Kansas City, Mo.

The present rules are as follows:

1. Pedigree must give name, color, sex, year foaled in, and name and address of owner.
2. Jack must measure 58 inches or more from the highest central part of the withers to the ground and measure 62 inches or more around the heart girth in average condition, and have 7 inches or more measurement around the front leg at the smallest place between the ankle and knee (the leg to be normal size).
3. Jennets must measure 56 inches or more from highest central part of the withers to the ground, and measure 60 inches or more around the heart girth in average condition, and have 6¾ inches or more measurement around the front leg at the smallest place between the ankle and knee (the leg to be normal size).
4. Any color admitted, provided they comply with Rules 2 and 3.
5. Young, undeveloped jacks and jennets may be registered when their sire and dam are registered in this Registry, provided the sire fills the above measurements. This will make a uniform type.
6. Each application must give exact measurements of foundation stock, so the certificate cannot be handed out with another animal.
7. Each application must be sworn to before a notary public or justice of the peace.
8. You can give the sire and dam names (barn names) for foundation stock.
9. This Registry will not recognize any other Jack Registry unless the animal meets the requirements of this Registry.
10. The fee for registering jacks and jennets in the Standard Jack and Jennet Registry of America shall be one dollar to stockholders and two dollars to non-stockholders for each animal registered. The fee for transfers shall be one dollar for each animal transferred. The fee in all cases to accompany the application. Each transfer shall be recorded before the offspring can be registered.

EIGHT JACKS FOR SALE.

Combining the blood of Autar, Black Giant and Lime Stone Wonder; all black, white points.

Have either a trotting or a coach stallion for sale or will trade for a good Percheron mare or jennets. Must be a good one. These horses are sound and the very best of breeders, but have one too many. **Chas. Wyatt, Petersburg, Pike County, Ind.**

JACKS AND STALLIONS

I can furnish a few extra good registered jacks and jennets, also a few choice draft stallions, for less money than any one. L. Donaldson, Olney, Lincoln County, Mo.

Jennets Wanted.

I want several big black aged jennets or colts.

E. E. LAUGHLIN,

Rich Hill, Bates Co., Mo. Route 1.

BUILDING A JACK'S REPUTATION.

It is not usually necessary to change locations with a good jack in public service, as its progeny from the mare will not breed. But it takes time to introduce a good jack in some cases, while in other instances patrons do not realize the value of a high class jack. Some mare owners wish to select the cheapest sire. The owner of every good jack might profitably consider the proposition of purchasing a few good colts from a jack that was expected to remain in that section indefinitely. The colts in question should be of the very best; they should also be out of good dams. The object in purchasing these colts is to thoroughly develop them and keep them convenient for the purpose of establishing the reputation of this particular jack. The same plan might be employed while introducing a jack, if the jack had been in service long enough to sire colts.

Feeding and developing young mules is a profitable line of business. Nearly any bank considers young mules the very best of security. But the purchaser should be in a position to thoroughly develop the colts and keep them growing every day, and not sell them to the first buyer that puts in an appearance, but hold them for a good, big, substantial price, so that the fact may be advertised that these particular mules brought so many dollars. It is never advisable to make a fictitious price. These transactions must be made honestly if for advertising purposes. The progeny repre-

JACKS IN SERVICE ON ONE OF THE BIGGEST MULE RANCHES IN MEXICO; PROPERTY OF J. A. DALY.

sents the real value of a sire. When one mule at maturity can be sold for $125 and another one for $375, the lesson is too plain to be overlooked. Many communities need this education.

KEEPS TWO JACKS TOGETHER.

To the American Breeder:—I see in your paper where you advise keeping young jacks in separate lots. I have two jacks; they are three years old this spring; have been together all their lives. They are 15 hands high; weigh over 900 pounds each; have nine inch bone in front. I drive them every day. They are good, quick servers. I am breeding three mares a week to each of them. In the barn they stand together in a double stall; I turn them in a lot and they play by the hour. Some say I will have to

keep them apart after while, but I don't think so.—B. L. Wilson, Washington County, Kansas.

A NEW JACK BOOK.

Volume 1 of the Standard Jack and Jennet Registry of America is under preparation and will be ready for delivery within a short time. In this volume will be recorded about 4,000 jacks and jennets. Material is now accumulating for volume 2. Everyone interested in jacks and jennets should send and get this jack stud book. The price is $2.00 to members, and $3.00 to non-members. Write to Wm. E. Morton, Secretary of the Standard Jack and Jennet Registry of America, 920 Scarritt Bldg., Kansas City, Mo.

LITTLE THINGS IN A JACK'S CARE

Every jack should have a good place in which to roll. This place should be spaded up and raked down smooth, mashing all the clods and making it very soft so as not to injure the jack when he rolls. Jacks certainly enjoy rolling and it is very beneficial. The average jack would roll several times a day if he had an opportunity. A rake conveniently located so as to smooth the surface and break the clods occasionally, should be a profitable investment.

At this time of year it is necessary to watch the legs of jacks to see if there are any pimples or any small sores starting. Keep the legs clean, and if an abrasion is made where the flies can infect it, the result is very frequently a jack sore. If the legs are examined carefully every day so as to catch the first sign of a jack sore, they can usually be prevented. A little iodoform dusted on these parts will keep the flies away. Any animal representing as much money as a good jack deserves to have his legs hand rubbed every day in order to keep the skin and hair in a healthy condition and see that the hairs are not stuck together anywhere.

Care should also be taken as to the condition of the feet. Keep them free from thrush. Many jack sores are the result of bad management and a little care will prevent them.

BUSY SELLING AND BREEDING.

To the American Breeder:—Please excuse me for not sending check some time ago. I have been pretty busy this spring; have bred 250 mares so far. Sold a jack last week and one this week. I am capsuling a good many mares and am having good results.—J. T. Watson, Rails County, Mo.

A SIRE OF MANY MULES.

To the American Breeder:—I owned a jack with the world's record for siring mules. He was the sire of 550 mules, got by natural service. This was Lucky Dutchman, 15.3 hands; weight 1255 pounds. Within the past fifteen years I have handled four of the best jacks that have been in the county.—W. W. Shott, Clinton County, Missouri.

Bring Out Your Mature Jacks

We have been figuring how to give more benefit to our readers from the scores of jack photos which are sent to this office each year. Such photos are always interesting but published "hit or miss" as they come, they are not always as instructive as good photos should be. It will be better to systematize the presentation of these pictures, and the plan we have decided to follow amounts, practically, to holding a jack show—as nearly as it can be done on paper. We will open with a class for mature jacks—four years old or over. Each jack, as its photo and description are received, will be given an entry number, which will be published with the picture and measurements. No names will be given out until the awards are made. Then all of the entry numbers will be published, along with the names of the jacks, and owners who entered them. Each photograph should give a straight side view of the jack's body, but may show his head turned slightly toward the camera if the owner desires. Only a few measurements are required. The blank below shows which ones. These are the measurements required by the Standard Jack and Jennet Registry of America. These measurements, and a good, clear photograph will show pretty accurately to an experienced man, what the jack is as an individual. Measurements should be taken with a tape line or string drawn tight enough to press the hair tight to the skin, but not enough to press into the flesh. We reserve the right to have a committee remeasure any jack and to publish the result of its findings. Photograps can be any size, but those on which the jack's body measures two and one-half to six inches are usually best. It is most important that they be clear and that the jack stands straight and naturally when photographed.

Our next issue will give the closing date for the contest. Owners who have suitable photographs should send in their entries at once. Every reader should save all issues (most everyone does so anyhow), as the list of names published after the contest closes will show to whom every jack belongs.

The judges will be experienced jack men.

Make all entries in the blank below; clip it out and mail to the American Breeder. If you do not want to cut your paper, drop us a postal card and we will mail you some printed blanks.

ENTRY BLANK FOR MATURE JACK.

American Breeder Contest—Kansas City, Mo.

Enter my jack, as follows:

Jack's Name..... Age.....

Height (measuring from a point level with the top of the withers straight to the ground),.....inches.

Heart girth (around body just back of the fore legs),.....inches.

Bone (around foreleg, smallest place between knee and ankle), ... inches.

Owner's Name..... County.....

Postoffice ..... State.....

QUIT BUSINESS SALE.

Two large Mammoth jacks, 16 and 16¾ hands high; coming 5 and 6 years old next July. Come and see them. I could truthfully say much in praise of these jacks, but they will do the talking. **Louis Koenig, Solomon, Dickinson County, Kansas.**

GOOD YOUNG JACK

For sale. As I have located and gone into the mercantile business, I will offer my fine young jack, Blue Jay, for sale, for the only reason that there are practically no mares here to be bred. Will sell cheap for cash, or trade for merchandise. Write quick. Have refused $1,000 at different times. Good server; quick, sure breeder and sires real classy mules. **George N. Conyers, Melba, Idaho.**

TWO BLACK JACKS

for sale. Six and eight years old; good breeders. One 64 inches high; 70 inches heart girth; 9½ inch shin. Price $600. The other 61 inches high; 64 inch girth; 7¼ inch shin; blocky built. Price $400. Either one of these jacks will pay for themselves in a single season if rightly handled. Good terms to good parties. No trades. **G. T. Ponge, Garrison, Mo.**

300 head of Colorado raised Jacks, Jennets, Mules and Brood Mares. All guaranteed. Prices right. **Lewis Swink & Son, Rocky Ford, Otero County, Colorado.**

JACKS AND MULES

We have 14 jacks from one to six years old; have lots of bone, size and quality; all black with white points.

Also have 128 yearling mules, coming two year old, and 26 mule colts. These mules are from grade draft mares; have lots of bone and width. Only 15 out of the 154 are horse mules, the balance are mare mules. Will sell at reasonable prices. **Scott, Abney & Jenkins, Virden, Macoupin County, Ill.**

JACKS.

20 good black jacks and some good jennets; coming 3 to coming 8 years old. Large, heavy boned, broken to mares and prompt servers. Prices reasonable. Come and see me. Barns 2 miles from town.

Phil Walker, Moline, Elk County, Kas.

KENTUCKY JACK FARM

Established in 1884.

A fine lot of black Mammoth Kentucky jacks. Big bone and plenty of weight. Will sell at special prices in order to make room for young stock. We sell more jacks to the Western trade than any breeder in Kentucky. Write for prices or come and see me. Guarantee to please our customers. **Joe E. Wright, Junction City, Ky.**

FAIRVIEW JACK AND JENNET FARM

32 Jacks and 35 Jennets, the best that grow, 14½ to 16½ hands high—jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address

J. C. HUCKSTEP,

Eolia, Pike County, Mo.

GRANDVIEW JACK FARM.

Summer Effects on Markets

Horse and Mule Trade Narrowing With Prices Still High for Good Ones. Prime Beeves Lower. Profit in Only Lighter Weights. Hog Movement Less; Prices Up.

Seasonable slowness is showing in the horse market. The volume of business is slowly contracting in keeping with approaching hot weather, and in July and early August neither the demand nor the supply will be of any importance. Such a period of dullness is a good thing. For more than nine months past there has been an insistant demand for all equine offerings. Prices have been high and only slight fluctuations have occurred from week to week. Approaching conditions simply mark the dividing season for the year's business.

While the market in the past two weeks has shown a slower tone, prices have not changed. A fair inquiry is still reported for all good, rugged workers and well fattened chunks. Heavy drafters and heavy mules have been scarce and high. Some trade was reported in fancy, heavy mule teams, but that demand came from limited areas.

The high temperatures of the past week is ripening the wheat rapidly and there may be a rush for harvest horses in the next few days. Cotton states report good prospects for a large crop this fall and if conditions continue good they will begin to need cotton mules late in August.

There is some city demand for chunks and expressers, mostly on the fill out order, and such requirements continue a factor, even at the dullest season. Construction work will afford another outlet on the replacement order, and all told the market at no time this summer should be without some demand.

The past season has been very successful for horsemen, especially those who raise good horses and those who have prepared them for market. The past nine months have fastened the industry firmly in the central west, and from now on it will be developed along quality lines. Farmers know the value of good young horses and mules, and are preparing to breed that kind in connection with general diversified farming.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs. up..	$230@280
Drafters, fair to good.....	150@225
Chunks, good to choice.....	125@160
Chunks, fair to good.....	85@120
Expressers and light draft...	60@120
Plain workers	40@ 85
Southerns, good	125@150
Southerns, plain to fair.....	65@120
Plugs.	20@ 55
Mules—	
13 to 14 hands.....	$ 75@120
14 to 15½ hands.....	110@150
15½ to 16 hands.....	140@185
16 to 16½ hands.....	180@265

Heavy Steers Discriminated Against.

In the past two weeks heavy steers fell 20 to 35 cents to a new low level for the season, and at that decline **were 75 cents to $1 under** the extreme high point this year. Dressed beef men say that it is hard to sell thick loin and large steaks, and **big rounds** are handled at a loss. Such a condition has placed heavy **steers at a disadvantage.** At the same time the heavy steers cost more to finish, cost more as feeders, and now are losing money. Some of the 1,400 to 1,500 pound steers now coming to market would have yielded a better profit two months ago as heavy feeders. On the other hand tidy light weight steers are selling higher than the heavy steers. Hot weather has made demand for light cuts of beef and killers have kept the pens clear of practically all yearlings and baby beeves offered. The contrast between heavy and light weight steers is shown in sales of the past week when 1,400 to 1,600 pound steers, well finished, brought $8 to $8.25, medium weights $7.75 to $8.40, light weights $7.50 to $8.55. And the bulk of the steers on the native side sold at $7.50 to $8.10. In Chicago the top prices fell in the past two weeks from $9 to $8.65, and sales above $8.50 were infrequent. The run of cattle at all markets has been fairly liberal, and the quality has been excellent. Few Mays have uncovered betters killing per cents than last month, and packers now have plenty of prime beef on hooks to carry them into July. The bulk of the fed cattle have been marketed, but the Southwest caked grassers are a source of good beef, and straight early grassers will be available in the next two weeks from below the quarantine line. Southwest cattle now are selling at $5.10 to $7.75. The run of grassers from Kansas and Oklahoma pastures will depend much on the weather. An unfavorable season will start the run early, and a continuation of good grass will hold many bunches back until frost. Present indications are that the season will make excellent grass beef, and that is one reason killers at present are indifferent to choice weighty corn fed steers.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers.....	$8.10@8.60
Good to choice steers.....	7.75@8.15
Fair to good steers.....	7.35@7.70
Common to fair steers.....	5.50@7.30
Meal fed, choice.....	7.25@7.85
Meal fed, common to fair...	6.50@7.20

Light Weight Butcher Cattle Needed.

Conditions that have operated to make a dull trade in heavy steers have forced keen competition into the butcher cattle market and tidy weight heifers, steers and heifers mixed, and yearling steers were up 10 to 15 cents. Heifers weighing 650 to 775 pounds, and steers 850 to 1,050 pounds have been the most desirable weights. The top price paid for yearlings within the past two weeks was $8.60, for steers and heifers mixed $8.50 and straight heifers $8.45. Cows are showing considerable grass sap and such kinds were quoted off 15 to 25 cents. Dry lot cows were steady. Bulls and calves are as high as ever. The top price for vealers was $10.25, and for bulls $7.50.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice.	$6.25@ 7.25
Fair to good.....	5.00@ 6.20
Common to fair.....	4.25@ 4.95
Canners.	3.65@ 4.00
Heifers—	
Choice fed.	$8.00@ 8.50
Good to choice.....	7.50@ 8.00
Plain to fair.....	6.50@ 7.35
Common.	5.00@ 6.45
Veal calves	6.00@10.00
Bulls.	4.50@ 7.50

Grass Shows in Feeding Cattle.

Last week stock and feeding steers sold at $6.75 to $8.10, a lower price range than two months ago. However the offerings have recently taken on large grass fills, and with the cost increased by larger weight there was little price difference. There is a good demand for all classes of stock, breeding and feeding cattle, and the supply continues small. In the next few weeks prices are expected to ease off some, though at no time this summer will they be very low.

The following quotations are for stock and feeding cattle:

Selected feeders	$7.65@ 8.00
Good to choice feeders....	7.35@ 7.60
Plain to fair feeders.....	6.85@ 7.30
Selected stockers	7.50@ 8.10
Good to choice stockers...	7.00@ 7.50
Plain to fair stockers.....	6.50@ 6.95
Stock calves	6.00@ 8.10
Stock cows	4.50@ 5.50
Stock heifers	5.00@ 7.25
Milch cows	35.00@90.00

Brisk Demand for Hogs.

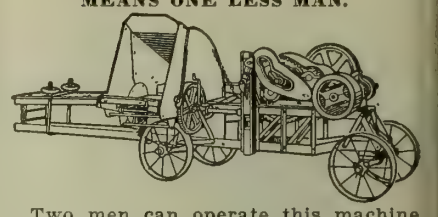
In the past two weeks sentiment concerning the hog market changed completely. Two weeks ago the market was on the down grade, but in the past ten days it rallied to a new high level for the past six weeks, and once more the market is within sight of the $9 level. Saturday the top price was $8.77½, an advance of 20 to 25 cents last week, making the May close 20 to 25 cents higher than the opening and 30 to 35 cents above the low point May 12. The top price today was $8.72½ and the bulk of the hogs sold at $8.60 to $8.70. The month of May developed little feature. The weight of hogs is on the decrease and demand for hogs is on the fresh pork basis. This has made a fairly well balanced market. A moderate June run is expected. A good many sows that lost March pigs have been rebred, and the June run of old sows will be small. Farmers will hold back considerable young stock for breeding purposes unless another cholera scourge begins.

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon., May 26.	$8.45@8.65	$8.25@8.47½
Tuesday	8.50@8.75	8.30@8.60
Wednesday .	8.45@8.62½	8.35@8.60
Thursday ...	8.45@8.67½	8.40@8.60
Friday	8.50@8.75	8.40@8.67½
Saturday ...	8.55@8.77½	8.35@8.55
June 2	8.50@8.72½	

The following quotations are for hogs:

Choice, 250@300 lbs	$8.55@8.65
Choice, 200@245 lbs	8.60@8.70
Medium weight	8.65@8.72½
Light weight	8.00@8.72½
Common to fair	7.50@8.45
Stags.	6.00@8.50
Boars.	4.00@6.50
Bulk of sales.....	8.60@8.70

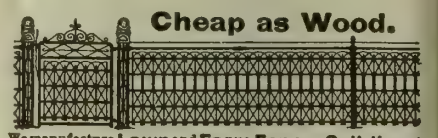


Weak Demand for Sheep.

Liberal receipts of sheep in the past two weeks have sold slowly at weak prices. The tendency is towards a narrow trade. Practically all the wooled lambs have been marketed, and only a few bunches of clipped fed lambs will come. Spring lambs and grass sheep will make up the bulk of the supply from now on. Kentucky and Tennessee are moving lambs freely, and will clear the supply within a few weeks. North of the Ohio river, and east of the Missouri river, the lamb crop is small. Choice wooled lambs are quoted at $7.75@8.25, clipped lambs $7@7.60, clipped native sheep $5@5.85, clipped Texas sheep $4.50@5.25, and goats $3.25@4.

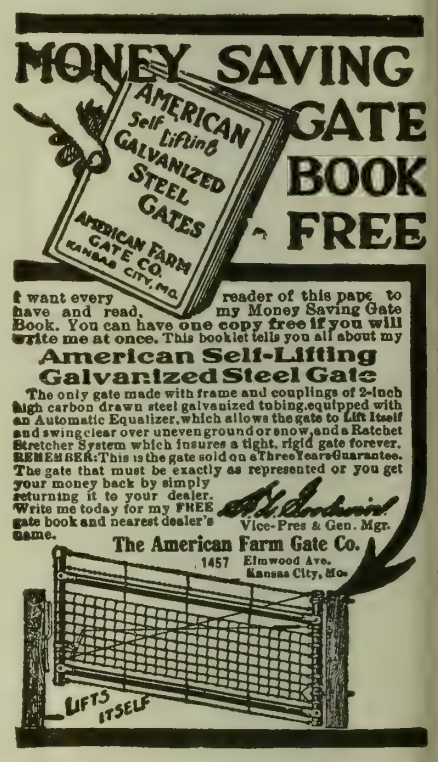
May Live Stock Movement.

Receipts of live stock last month at the five western markets were about as expected. There was a decrease of 36,000 cattle, 154,000 hogs and an increase of 73,000 sheep. Omaha, St. Louis and Kansas City re-



AUTO-FEDAN
(Self Feeding Hay Press.)
MEANS ONE LESS MAN.

Two men can operate this machine. Bale as much as 3 will with any other. Can furnish with 12-horse engine mounted on same frame, direct gear drive, weight only 4,000 lbs. The most compact and nicest machine there is out. Write for catalogue.



AUTO-FEDAN HAY PRESS COMPANY,
1545 W. 12th St., Kansas City, Mo.

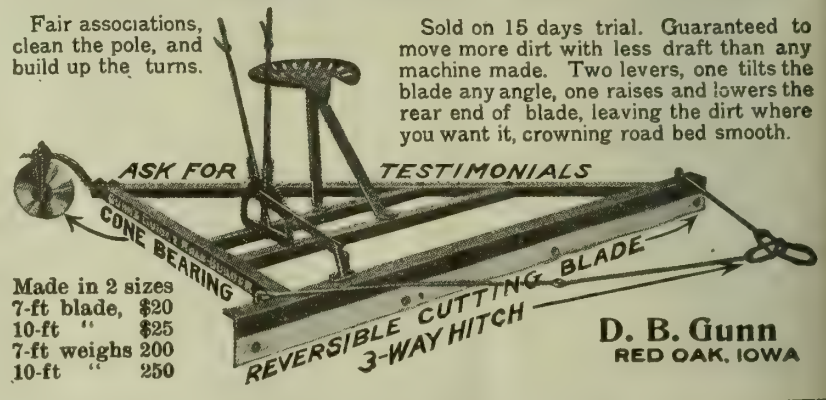
Cheap as Wood.

We manufacture Lawn and Farm Fence. Sell direct shipping to users only, at manufacturers' prices. No agents. Our catalog is Free. Write for it today.
UP-TO-DATE MFG. CO. 990 10th St., Terre Haute, Ind.

MONEY SAVING GATE BOOK FREE

I want every reader of this paper to have and read, my Money Saving Gate Book. You can have one copy free if you will write me at once. This booklet tells you all about my

American Self-Lifting Galvanized Steel Gate



The only gate made with frame and couplings of 2-inch high carbon drawn steel galvanized tubing, equipped with an Automatic Equalizer, which allows the gate to Lift Itself and swing clear over uneven ground or snow, and a Ratchet Stretcher System which insures a tight, rigid gate forever. REMEMBER: This is the gate sold on a Three Years Guarantee. The gate that must be exactly as represented or you get your money back by simply returning it to your dealer. Write me today for my FREE gate book and nearest dealer's name.

The American Farm Gate Co.
1457 Elmwood Ave.
Kansas City, Mo.

GUNN'S 2-HORSE, GUIDER ROAD BUILDER

Fair associations, clean the pole, and build up the turns.

Sold on 15 days trial. Guaranteed to move more dirt with less draft than any machine made. Two levers, one tilts the blade any angle, one raises and lowers the rear end of blade, leaving the dirt where you want it, crowning road bed smooth.

Made in 2 sizes
7-ft blade, $20
10-ft " $25
7-ft weighs 200
10-ft " 250

D. B. Gunn
RED OAK, IOWA

KEROSENE, GASOLINE AND OIL
To Consumers at Wholesale Prices
NO WATER IN MY KEROSENE OR GASOLINE.

XXX 46 gravity water white kerosene.....$6.00 for 52 gal. bbl.
XX 42 gravity kerosene (the kind usually sold).....$5.25 for 52 gal. bbl.
XXX 64 gravity gasoline. . .....$10.00 for 52 gal. bbl.
1 case graphite axle grease (2 doz. 3 pound pails).....$3.50
40 gravity prime white stove distillate .....$4.50 for 52 gal. bbl.
83 gravity stove distillate .....$4.25 for 52 gal. bbl.
60 gallon (26 gauge) galvanized steel tank with pump and hood cover complete—a great convenience in every home. $3.60
Extra heavy pure crude oil, steamed and settled (black oil) good lubricant, just the thing for greasing tools.....$4.00 for 52 gal. bbl.
I will pay $1.25 each for my crude oil barrels, and $1.50 each for refined oil barrels, returned to me at Coffeyville, Kas., in good order, less freight charges on same.

C. A. STANNARD, Box A, EMPORIA, KANSAS

WHITE'S SHORTHORNS

Good Cattle, Good Breeding, Good Dealing.

Have had a good season's business and stock is sold down to calves.

Inspection invited.

C. H. WHITE, Burlington, Kas.

160 ACRES OF HAY LAND

for sale or trade for pure bred horses; Percherons; mares preferred. Price $20 per acre. F. D. Maddex, Arcadia, Neb.

ported a moderate increase in cattle receipts, St. Louis a slight increase in hogs, and all markets increased receipts of sheep. Total receipts at the five western markets last month were 477,400 cattle, 1,405,700 hogs, 776,900 sheep. In the first five months this year cattle decreased 120,000, hogs 1,232,000, and sheep 266,000, the total at the five markets being 2,723,400 cattle, 7,242,300 hogs, 4,207,700 sheep.

SOMETHING YOU DIDN'T KNOW ABOUT ALFALFA.

To the American Breeder:—The heating and burning of alfalfa hay in the stack may be avoided by proper curing. Sometimes weather conditions make it almost impossible to put the hay in stack in good condition; but usually the mischief is done by water in the stem of the plant, A. H. Leidigh, assistant professor of crops at the Kansas Agricultural College, says.

A comparison will show why this water did not readily cure out of the stems. If a tree is cut down on a cool, cloudy day, said Professor Leidigh, the leaves will remain green and fresh for some time. They take the water from the trunk and pass it off into the atmosphere. If the weather is reasonably cool for a few days the water will all be taken out of the tree.

Now, if the tree is cut on a hot, sultry day, the leaves will dry up and fall off. The water is still in the trunk of the tree, and there is no way for it to get out quickly. It is the same with alfalfa. If the sun is so hot that the leaves are quickly shriveled, the stem will dry out very slowly. Several alfalfa stacks near Manhattan have burned down, and in every case improper curing of the hay before stacking seemed to be the cause.

When it is impossible to wring water out of the hay, says Professor Leidigh, it is dry enough to stack. The best way to cure hay is to rake it into small windrows and let it dry out slowly. If the ground is damp, or if the air is very moist, the windrows must be turned frequently to expose all the hay to the sun.

Hay often heats in the stack because it is rained on, or because it absorbs moisture from the ground. Not less that $5 to $10 worth of hay is spoiled on the top and bottom of a 25-foot stack of alfalfa, put up in the usual way. This loss may be avoided by stacking on a foundation of poles, or under sheds. The money saved on a few stacks will pay for the shed.—Charles Dillon, Kansas Agricultural College.

SHORTHORNS TOP MARKET.

One of the leading Southern Kansas breeders of Shorthorn cattle put a good top on the Kansas City market recently with a car load of 1,410 pound Shorthorn steers which sold at $9 a hundred. They were sold by H. G. Brookover of Eureka, Kas., who not only fed them but bred them, and who has always handled his Shorthorns with a view to produce the kind that will make good on the beef market.

Iowa Must Raise Its Feeders

A Car of Baby Beef From Every Other Farm the Quota Proposed. Agricultural Welfare Requires Execution of Some Such Program.

By Chas. Escher, Jr., President Iowa Beef Producers' Association

The year just closed has been a remarkable year. The volume of our crops was never so great. The United States harvested her first three-billion bushel corn crop. Other grains have been harvested in about like proportions. There is a general abundance except in live stock productions. That the supply of live stock for 1913 will aggregate less than the supply for 1912 is the concensus of opinion by those capable and in a position to judge. That it will require seven years before the United States can again get back to producing her normal supply of cattle is also predicted by one who is regarded as a keen calculator. And by that time our population will have increased another ten million, proving that the shortage will continue and become greater as time goes on. Big crops are always principal factors in the general prosperity of an agricultural people. The wheels of commerce are oiled by the hand that feeds the cow and holds the plow. When the farmer is prosperous, it stimulates the nation, but when an agricultural people begin to neglect like stock production, sooner or later poverty will knock at the door.

The population of the United States has doubled every twenty-five years since 1685. During the past twelve years our population of the United States has increased 25 per cent, while our supply of beef cattle has decreased more than 30 per cent. These figures do not indicate any immediate relief. Next year and each succeeding year for the next decade to come will see decreasing receipts in live stock markets. Iowa is the greatest of all the agricultural states in the Union, because of her fertile fields. Iowa has been famous as a cattle feeding state, and if Iowa continues to hold her station in agriculture she must get back into live stock production. Agriculture has been called the Wheel of Commerce, and in my estimation stock raising is the main spoke in this great agricultural wheel.

Being imbued with a natural love for the old cow and having foreseen a beef cattle shortage coming, I decided to secure aid for the encouragement of beef production in Iowa, and in the 34th General Assembly, we were successful in securing an appropriation of $7,500 to promote the beef cattle industry in Iowa. Beef production will, and necessarily must, become an Iowa industry. With it will come more silos, more permanent blue grass pastures, more alfalfa and clover, less soil robbing, and more conservation of the fertility of our soils. The result will be less acres of farming with increased yields of forage and grains. A more prosperous people, and an increased awakening of love for the farm. A prosperous people are most usually a contented people. If the farmer does well, he natuarlly loves his occupation. Prosperity will, in most instances, solve the question of making the farm more attractive. Beef production is a topic widely discussed nowadays, and Iowa must of necessity send out her influence for good or evil.

There are over 200,000 quarter-section farms in Iowa. At least half of these ought to be producing some sort of beef. This would give us 100,000 farmers in the entire state, engaged in beef production. Assuming that these farmers have farms averaging 160 acres each, each farmer engaged in the production of beef could easily keep enough cows to produce a carload of baby beef (twenty head to the car). If each of these farmers would market this carload of baby beef, there would be 20,000 head in each county, or 2,000,000 produced on the farms in the state of Iowa. If these cattle were fed out as baby beef they should weigh from 1,000 to 1,200 lbs. at 18 to 24 months of age, and at present prices, which will be a conservative price for an estimate, they would net close to $100 per head, or about $2,000 per car for each farmer thus engaged. This would mean a net income for each county of about $2,000,000, or a grand total of $200,000,000 for beef production in Iowa alone. This would only utilize half the farms, the other half could engage in dairying, truck farming or exclusive grain farming.

To be prosperous we must market our crops via the live stock route, thus keeping the fertility on our farms. It has been said that the United States was capable of feeding the world, but the problem now confronting us is, whether or not we can, in years to come, feed our millions. He who produces two blades of grass, or two pounds of beef, where formerly but one grew, is a benefactor to humanity. Conservation is a prime factor of importance to-day. Beef production is a matter of special interest, and important to all the farmers in the corn belt states. We have learned how to raise the crops best adapted to our soils and climate, but we have not learned that we must return to our land a part of what we take out. The right manner of producing beef is particularly adapted to the maintenance of our soil fertility. Each farm produces a large amount of roughage, for which there is not, nor ever will be, any profitable market, but with the beef herd you can profitably use it all. The beef business is of special interest just now, for we are entering a period that will be known as the period of restoration of beef production; and I think most farmers now see that we must restore beef cattle on our farms. It is all important that in this work of restoration of beef, we adapt the best and most economical methods, so that in years to come, we may not again find ourselves engaged in an unprofitable business. The silo has come to stay and the time will come when silos are as common as corn cribs on our Iowa farms. It is only by the use of silos and better and more permanent blue grass pastures that beef production on Iowa farms will be a profitable business; and then I would advise only the production of the best class of beef. We would not advise anybody attempting anything short of it on our high priced lands. It is not a question of fattening cattle, but the growing of beef that we are most especially interested in. Corn belt farmers must awaken to the fact that if they expect to handle cattle, they must breed them. The Pacific coast will grab the major portion of our range bred cattle from now on and they must and will have them—hence if we wish to produce beef we must raise our own feeders.

CARE OF COWS PREVIOUS TO CALVING.

To the American Breeder:—For ten days preceding the time for calving, the cow should be kept in a comfortable, well-littered box stall or pen, in which there is no manger. The feed should be given in a box or basket, which should be removed after the feed is taken. The coarse feed may be put in the corner, and no more should be given than she will eat. This rule should be observed, not only before calving, but at all times.

A CROP EVERY YEAR

A country that will do that, is worth tying to Plenty of rainfall would make millions of acres in some portions of the country very productive. But where it cannot be depended on, farming is hazardous. The entire line of the KANSAS CITY SOUTHERN RY. runs thorugh the certain rainbelt and if the farmer does his duty, he is sure of a crop. Quit gambling on the climate. Make your home in this region of perpetual crops. The richest virgin soil is waiting for you here at prices you will never again be able to touch. Send today for information about land open for settlement and let the Kansas City Southern start you on the way to fortune. Don't delay visiting the country that will mean better conditions and steady profits for you. Remember—a crop every year!

WM. NICHOLSON,
671 Thayer Bldg., Kansas City, Mo.
Immigration Agent, The Kansas City Southern Railway.

Irrigated Farm Land

With Abundant Water Supply.

Grazing Land (Watered) and Timber for sale in Southwest Colorado. Irrigation facilities here are unexcelled and this has long been Colorado's best live stock section.

Fine, moderate climate; no extremes; tornadoes unknown.

155 acres fine private water right. 2½ miles from Mancos; 30 acres in meadow, timothy and red top. Alfalfa, meadow, grain land, small orchard. Good six room house just been remodeled. Hay barn 40x56. Horse barn, cow sheds, chicken house, shop, granary, ice house, etc. Good fence; $55 per acre; a bargain.

160 acres; good house; barn, cross fences; chicken house; sheds, etc.; four shares in storage system besides fishing in waste water. Four acres in cultivation. New farm; fine land; four acres in orchard; $5,000.

160 acres four miles from town; good small house; barn; fenced; partly under cultivation; fine land; $2,000.

Raw land, agricultural and grazing at $5.00 per acre.

W. L. Morse, Mancos, Colorado.

PARTNER WANTED.
OWNER OF FIRST CLASS STOCK RANCH.

Fully equipped, in Southwest Colorado, stocked with Percheron horses, Galloway cattle, Duroc Jersey hogs, besides other stock, desires to sell a half interest to young or middle aged man who has had practical experience in the handling of stock, purchaser to assume active management, $9,500 required, but would carry a part of this if necessary. Sickness the reason for selling.

Three acclimated Percheron stallions for sale, all young and good. Address, **M. F. Laycock, 608 Kansas Ave., Topeka, Kas.**

STOCK RANCH

For sale in Hooker County, Neb. Modern bungalow, barn, corrals, wells, fencing, alfalfa. Handle 300 to 400 head. Cheap leases; 40 acres corn. BARGAIN. For particulars address, **F. Lazy H., Hecla, Neb.**

800 ACRE STOCK RANCH

For sale or exchange for other property in Kansas or Missouri; fine agricultural and grass land in Eastern New Mexico; 2 sets of improvements, including good windmills and wells. $10 per acre. For further particulars write **L. F. Williams, Murdock, N. M.**

"REAL ESTATE WANTED."

Sell your property quickly for cash, no matter where located; particulars free.—Real Estate Salesman Co., Desk 9, Lincoln, Neb.

HAVE RETIRED.

Old, and wish to sell. I will sell you this highly improved stock farm, good buildings; woven wire fencing; 485 acres. Can't be beat. Write **Lock Box 285, Wellington, Kans.**

CATTLEMEN.

British Columbia bunch grass range land. We can locate you on Government land, 21 year lease with option to purchase. Have several ranges with cattle for sale. **The Wright Investment Co., Ltd., 1110 Dominion Bldg., Vancouver, B. C.**

Throwing large quantities of roughage before a cow leads her into the bad habit of eating only the most appetizing parts, and so wasting much feed. It is a good practice to take a lantern and go the rounds of the barn, before retiring for the night, to see that everything is as it should be.—T. L. Haecker, Dairy and Animal Husbandry Division, University Farm, St. Paul.

GRASSHOPPER POISON UP-TO-DATE.

To the American Breeder:—The grasshoppers are coming. Some of them are already at work. Fully 90 per cent of the eggs laid last fall probably passed through the winter uninjured, according to George A. Dean, the insect expert at the Kansas Agricultural College. Professor Dean says grasshoppers probably will do more damage this year than in 1912, unless prompt and vigorous work is done to destroy them. Poison bran mash, the hopperdozer, poultry and young hogs have proved efficient for checking the ravages of grasshoppers.

Poison bran mash should be made this way: Bran 20 pounds, paris green or white arsenic 1 pound, syrup 2 quarts, oranges or lemons 3, water 3½ gallons.

In preparing the bran mash, mix the bran, paris green or white arsenic thoroughly in a wash tub while dry. Squeeze the juice of the oranges or lemons into the water and chop the remaining pulp and the peel to fine bits and add them to the water. Dissolve the syrup in the water and wet the bran and poison with the mixture, stirring at the same time so as to dampen the mash thoroughly. The bait when flavored with oranges or lemons was found to be not only more attractive but was more appetizing and thus was eaten by more of the grasshoppers.

The damp mash or bait should be sown broadcast in the infected areas early in the morning. The amount of bait made by using the quantities of ingredients given in the formula should cover four or five acres. As very little of the bran mash is eaten after it becomes dry, scattering it broadcast in the morning and very thinly places it where the largest number will find it in the shortest time. Sowing it in this manner also makes it impossible for birds, barnyard fowls or live stock to get enough to kill them. On alfalfa fields, in order to fields, in order to get the results, the the bait should be applied after a crop has been removed and before a new crop has started. As the poisoned bait does not act quickly, it will be from two to four days before the grasshoppers are found dead and these will be more numerous in the sheltered places. It does not take much poison to kill them. Even a small portion from one of the poisoned flakes will be sufficient to cause death.

Coal oil has been used in many ways for the destruction of grasshoppers, but is most commonly used in the hopperdozer, a device which consists of a long, shallow, galvanized iron pan, mounted on very low runners. The hopperdozer is very effective where it can be drawn over an infested area near the surface of the ground. It is necessary wherever grasshoppers become destructive. On infested bare areas or fields where it does not injure the crop, grasshopper damage can be quickly checked by its use. It can be used without injury in an alfalfa field for two or three weeks after a crop has been cut.

Any grade of kerosene may be used in the hopperdozer. The first cost of a hopperdozer should not be more than $8. It should be operated at a cost not to exceed 20 cents an acre.—Chas. Dillon, Kansas Agricultural College.

National Egg Laying Contest

Leading Hen Laid 141 Eggs in Five and One-Half Months. Until May 1st Hens Averaged Fifteen More Eggs Each Than Last Year for Same Period.

To the American Breeder:—It now begins to look like most of the pens in the National egg laying contest at Mountain Grove, Mo., are going to make really creditable records. No records are being broken. However, every hen in the contest but nine has laid, and they all seem to be doing their best. No individual or pen record is extremely high, but up to May 1st the hens had averaged 15 eggs each more than for the same period last year. The English pen is still gaining a little each month over the American pens. Some suggestions as to the reason for their record and their lead over the American pens are discussed in the latter part of this report. A Buff Wyandotte hen, No. 600, from Maryville, Mo., holds the record for April by laying an egg every day during the month. The hens are eating more feed than last year, especially is this true of the dry mash. Pen No. 26, Buff Wyandottes, laid 240 eggs during the month, an average of 24 eggs per hen for the 30 days, and won the silver cup for this month. Twenty-four pens laid over 200 eggs each during the month of April. Three hundred and sixty-seven hens laid more than 20 eggs each during the month. Out of the 700 hens, over half of them laid more than 20 eggs each in 30 days in spite of the fact that 195 hens had to be broken from broodiness.

The leading ten pens (of ten hens each) have made the following record for the first five and a half months:

Pen No. 2	S. C. White Leghorns, England	1,117 eggs
Pen No. 23	Silver Wyandottes, Illinois	948 eggs
Pen No. 57	Black Langshans, Missouri	914 eggs
Pen No. 19	Silver Wyandottes, Iowa	914 eggs
Pen No. 33	Barred Plymouth Rocks, Illinois	865 eggs
Pen No. 49	Black Langshans, Missouri	850 eggs
Pen No. 56	White Orpingtons, Kentucky	846 eggs
Pen No. 20	White Wyandottes, Arkansas	842 eggs
Pen No. 58	Buff Orpingtons, Missouri	836 eggs
Pen No. 30	Buff Wyandottes, Vermont	832 eggs

The following hens have made good records for five and a half months, including the winter months. Their total record to May 1st was as follows:

Hen No. 66	S. C. White Leghorn, England	141 eggs
Hen No. 860	Buff Wyandotte, Vermont	136 eggs
Hen No. 600	Buff Wyandotte, Missouri	133 eggs
Hen No. 735	Black Langshan, Missouri	133 eggs
Hen No. 62	S. C. White Leghorn, England	126 eggs
Hen No. 65	S. C. White Leghorn, England	126 eggs
Hen No. 871	White Wyandotte, New Jersey	123 eggs
Hen No. 656	White Wyandotte, Arkansas	123 eggs
Hen No. 61	S. C. White Leghorn, England	123 eggs
Hen No. 601	Silver Wyandotte, Iowa	122 eggs
Hen No. 857	Buff Wyandotte, Vermont	122 eggs

The Feeding Test.

The pen in which the hens have feed of all kinds before them at all times, leads in the feeding test, and has laid 790 eggs. Then follows the Canadian method with 765 eggs; grain feed in automatic feeders, 724 eggs; Maine method of feeding, 708 eggs; and on down to 481 eggs. The strange part of the experiment so far is that the egg farm method of feeding has given the poorest results. This pen is being fed mash and grain as recommended by one of the large egg farms of the east. They also are fed mustard bran in the mash as recommended by this farm.

Why Does the English Pen Lead Our American Birds?

There must be a reason. Just what is responsible for this difference is yet to be determined. But when any one breeder in England or elsewhere can pick out a single pen of birds which will outlay 69 pens of American birds, and in five and a half months can get a lead of 169 eggs over its nearest competitor, we are inclined to believe that more than mere "luck" is responsible for this difference. After traveling on the ocean and land for two weeks enroute to Mountain Grove, these birds laid their first eggs in about three or four days after they arrived, and have kept it up consistently ever since. This pen must have been without feed or water a good portion of the time while being shipped. They appeared very thirsty and hungry when they arrived at this station, and there was no evidence of any feed about the shipping coop. Notwithstanding these facts and the fact that they were jostled, more or less, roughly handled and transferred several times enroute, they soon set about laying with a vengeance.

In view of the above rather startling facts, the question naturally arises, "Why are these hens from across the pond so far excelling the best layers which American breeders have been able to produce?"

The average person wants to know right away whether tne English White Leghorns look any different from the the American White Leghorns. Yes, they do. The Leghorns from England have a distinctive type quite similar to the American Minorca. They are slightly larger than the American White Leghorns, more rangy, with larger combs, lighter colored eyes, and tails pinched or not well spread. In this difference in type, some poultrymen think they see the secret of the difference in egg production. They declare that the English Leghorns have more of an "egg-type" than their American cousins. Perhaps they are right, although there is room for a reasonable doubt.

Other observers of the contest declare that it is all a matter of breeding, that while utility poultry breeding in America is just in its infancy, in England it has been studied and reduced to a science for centuries. They simply admit that the American breeder has been out-classed, that he still has a lot to learn, either by experience and experimentation, or by taking lessons of his English cousins. The change in climate may have stimulated the English birds to better production. The change of climate would more than likely increase or decrease the production and it seems to have had the desired effect in this case. We are of the opinion that back of it all, however, is a difference in selection and breeding.

The owner of the English pen which is leading at the State Poultry Experiment Station at Mountain Grove, Mo., states that this pen of pullets was bred from females with high records and also sired by males bred from high laying hens.

We have been urging Missouri farmers and poultry raisers for several years to breed from high layers, or at least from good layers, and have also insisted that the males which head the flocks should be sons of high layers. The latter is more important in our opinion, than the former. Of course, it is understood that the breeding stock must be reasonably good size, considering the breed, and also be birds of high vitality. We feel that paying so much attention to color of the average poultry breeder has been feathers and show records that they have lost sight of the production of eggs to too great a degree.—T. E. Quisenberry, Director, Missouri State Poultry Experiment Station.

CHICKS AND LICE.

To the American Breeder:—The greatest enemy of the chick, and that which causes more loss than any other one cause is chilling; the second enemy in importance because of amount of loss is lice; both lice and chilling are the indirect cause of bowel troubles because both sap the vitality and life of the chick, making it impossible for the little fellow to resist the organisms of disease which are always ready to attack it.

Dusting the setting hen helps, but some lice are quite sure to escape and can later be found on the head of the chick; rub a little dab of lard on top of the chick's head, getting it into the down thoroughly, and you will get these; repeat the dose in a week and if the hen is furnished a good dusting place, the lice are not likely to give any more trouble; but whenever you see a chick that seems unhappy, eyes closed, droopy, look for lice.

The brood coops should be thoroughly sprayed before using with some coal tar preparation, sheep dip, whitewash, or mixture of four parts coal oil and one part crude carbolic acid; it pays to be ahead, and that explains why so few of us are making anything on our poultry; we neglect these little things; because of neglect disease gets the start of us, we become discouraged because of the losses and give up and blame our luck, when all the bad luck might have been prevented by a little careful preparation.

Give the chicks a clean place, all the heat they can stand, keep them free of vermin, and you can safely count them before they are raised.—W. E. Vaplon, Colorado Agricultural College.

CAPONIZING DEMONSTRATION.

To the American Breeder:—Probably the most valuable part of the program of the meeting of the State Poultry Federation at the Kansas Agricultural college, June 25 and 26, will be a caponizing demonstration. George Beuoy of Cedarvale, Kas., is to give this practical exhibition. He is said to be one of the greatest experts in the United States and, therefore, his part of the program will be of very great value to all poultrymen who desire instruction and enlightenment in caponizing.—Charles Dillon, Kansas Agricultural College.

PRINCIPLES OF FARM ACCOUNTS.

Farmers' Bulletin 511 of the Department of Agriculture contains some interesting facts and recommendations in connection with bookkeeping on the farm. "That there are over six million farms in the country which utilize land, labor and capital as means of income making" gives the author the opportunity to discuss the subject of the value of the farmer keeping an accurate and systematic account of his farm management the same as the business man or the railroad magnate.

Two important points must be considered in an attempt at farm bookkeeping. What does it cost to produce farm products? By selling at market prices, what profit is made on them?

These suggestions are offered:

1. Consider as one unit all that may be termed real estate, as land, farm

buildings, fences, ditches, etc., whether the farm is rented or owned by the operator.

2. Do not consider that the farmer or his family receive anything for their labor unless they are paid in cash the same as hired labor. If there is a surplus at the end of the year, it is their compensation. In this way the accounts will not be confused with items not strictly cash.

3. Farm products used by the household should not be credited to the farm in the cash account along with the products sold, but should be taken care of separately.

COUNTRY HOMES NOT THE MOST SANITARY.

To the American Breeder:—Some mothers and fathers of students attending the Kansas Agricultural College learned recently why their children return from college and insist on disorganizing the whole house and farm in order to make it sanitary. "The average farm," said Dr. S. J. Crumbine in a lecture to 800 farmers attending the state farmers' institute at the Agricultural college, "is a more insanitary place to live than the average home in the city. The well, the barn and the outhouses are, in most cases, located with regard only to convenience and not sanitation. The health of the city is directly dependent upon that of the country and therefore everyone should be interested in obtaining better conditions in rural districts."

Dr. Crumbine, in speaking of contagion of disease, pleaded with the farmers to cover the well with cement instead of boards, remove the outhouses, burn the waste matter on the farm; in case of sickness, either to call the doctor or let nature take its course, let patent medicines alone, swat the fly and vary the diet served on the average farm table. It has been discovered, Dr. Crumbine said, that because of the insanitary conditions of the country, nearly every epidemic of typhoid starts there. It has been started in the city in nearly every case by the milk supply from the country. Typhoid, therefore, has become known as a rural disease.—Charles Dillon, Kansas Agricultural College.

A FEW OLD ONES.

Frank Baccus, a Nevada negro, 122 years old, is strong and in good health. He was born in Missouri in 1790.

Mrs. Rebecca Kissick passed her 104th milestone on September 14. She doesn't believe in the drinking water theory of longevity and rarely drinks more than one glass of water in four days.

Charles Driggers, an inmate of the Alabama Confederate Home, is 115 years old and still in possession of his mental faculties. He served under Andrew Jackson in the defense of New Orleans.

Nami Shimooka, a Japanese woman from Yamaguchi perfecture, 130 years old and marvelously robust in health, is making a sight-seeing trip on foot from her home to Osaka and Kiata.

Fannie Porter, a negress, living in Nowata, Okla., is 142 years old. In spite of her great age she is still springhtly. She has never been sick a day in her life and predicts that she will live to be 200 years old.

"Grandma" Betsy Story of White county, Illinois, is 100 years old today. She was born in South Carolina, going to Illinois in 1818. She is the mother of ten children, all of whom reside on the same farm with her.

Mrs. Lucy Mosby Hayes of Girard, Ill., who was 100 years old on November 23, last, says she expects to live longer than her father, who died at the age of 104. Mrs. Hayes, a pioneer in that section of the state, is hale for her great age.—Live Stock World.

LUBRICATION OF FARM MACHINERY.

To the American Breeder:—One of the little things that is lacking in a majority of farm implements is a good and convenient system of lubrication. The common oil cup with open top or loose cap is sure to get filled with dirt and grit which cut out the bearings, largely increasing the power required to operate the machine and greatly reducing its period of usefulness.

The hard oil cup, which holds enough oil to last a week or more, is always tight and can be screwed down a little each day, thus insuring a clean bearing and a regular supply of grease. Many of the common implements could be vastly improved by replacing the common oil holes with hard oil cups.

The oil holes can be easily reamed out and threaded to the proper standard and the hard oil cups screwed into them. The amount of work and expense required will be returned many fold in the saving of horse flesh and in the increased life of the machinery.—Jerome B. Frisbee, Colorado Agricultural College.

FIELD NOTES

Read the advertisement in this issue of C. E. Hodgden, Galesburg, Kas. He has a standard bred trotter and a mammoth jack for sale.

Two large mammoth jacks are advertised for sale in this issue by Louis Koenig, Solomon, Kas.

J. J. Tschudy, Blakeney, Tex., is advertising a Percheron mare with stallion colt and a Percheron stallion for sale in this issue. Look up the ad.

W. H. Schnelle of Lemonville, Mo., has a Shire stallion, O. I. C. pigs, White Wyandotte and Black Langshan eggs for hatching for sale in this issue. Read the ad.

W. B. Black, V.S., of Osakis, Minn., is in the market for a partner in the stock raising business. Read his advertisement in this issue and write for further particulars.

Read the advertisement in this issue of "F. Lazy H.," Hecla, Neb. He is advertising a stock ranch for sale.

A good young jack is offered for sale in this issue by Geo. N. Conyers, Melba, Idaho. He is offering this jack cheap as he is out of the breeding business.

The best time to give Spohn's Cure is after feeding and watering, so that the effect will be as strong on the throat as possible. In severe cases the dose may be given every hour. Treat all horses on a farm or in stable where there is no case of contagious disease. Doses from 5 drops for a baby colt to a full teaspoonful for a large draft horse. "Spohn's" is advertised regularly in this paper and has long been one of the most widely used remedies on the market.

Harry Pahl of West Side, Iowa, is offering his Belgian stallion for sale in this issue as he is going to quit the breeding business.

John Dalton of 235 South 26th St., Lincoln, Neb., is in the market for a saddle horse. Look up the ad in this issue and if you have such a horse as he describes, write him.

Speaking of the different remedies recommended to destroy worms, Mr. E. C. Stone, well known live stock authority and secretary of the American Hampshire Swine Record Association, says: "There is nothing within my knowledge as good or as cheap as 'Sal Vet.'" He is supported in this claim by many other leading lights in the live stock industry. We do not hesitate to recommend "Sal Vet" to our readers, because of the good reports we have heard and because of the extremely liberal manner in which it is sold. Mr. Sidney R. Feil, president of the S. R. Feil Co., manufacturing chemists, Cleveland, Ohio, who make this preparation, offers in his advertisement in this paper a full 60-day supply of "Sal Vet" without a cent of pay in advance and with the plain understanding that if it does not do what is claimed for it, no charge will be made. Be sure to look up this ad.

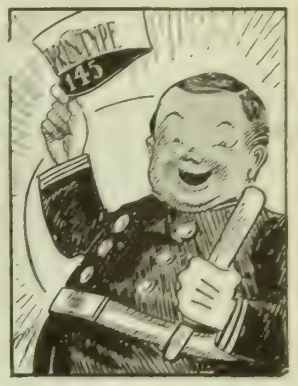
A liniment that makes good so consistently that it will hold customers year after year must possess an abundance of merit. Absorbine is continually making new friends, but it also holds the old ones. F. B. Loomis, 1052 Richard St., B. C., writes May 22, 1912: "I have been using Absorbine ever since 1892. I started using it the season of 1892 with the mare, Nellie Mason, that I was racing that year, and have stuck to it ever since. I can't say too much for it and I keep it in the stable all the time." Absorbine reduces swellings and fatty bunches, strengthens strained ligaments, muscles, heals cuts, bruises, allays pain and inflammation. Does not blister or remove the hair and horse can be used. $2.00 a bottle at druggists or delivered. Address W. F. Young, P. D. F., 388 Temple St., Springfield, Mass.

Notice our school pages in this issue. We are advertising a line of schools which we believe will meet the needs of a great many of our readers, and we will be glad to have everyone who is interested in any of these schools, mention the name of the American Breeder when making inquiry for catalogues or other information.

Among the good schools at which a business training can be secured, we are glad to mention the Fayetteville Commercial College at Fayetteville, Ark. A few of the advantages of a school at this point are mentioned in the ad.

The Kansas City Veterinary College is looked upon as one of the leading institutions of its kind in the world. There is no school anywhere in which the practical side is kept more closely associated with science and investigation. Please read the advertisement of this institution and mention the American Breeder in all communications.

Many of our readers who cannot conveniently leave home, but who want to become more proficient in business practices, will be interested in investigating the Chicago Correspondence School, 1017 Chicago Opera House Block, Chicago, Ill., as per advertisement in this issue.



The Terre Haute Veterinary College, Terre Haute, Ind., is one of the staple institutions of its class in America, and has advertised in the American Breeder for several successive seasons. In writing this school kindly give us mention.—Advertisement.

When you begin to train a young horse, do it with mingled firmness and goodness.

PRINTYPE

—Receives the Plaudits of the Public—

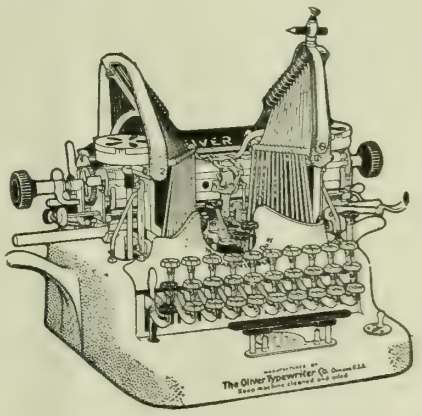
Vigilant Protector of People's Eyesight Hailed as a Benefactor by Many Thousands of Enthusiastic Admirers. "Officer Printype" Responds With Becoming Modesty.

Officer Printype says: "I am overwhelmed by the ovation which has greeted my appearance in your midst. I am simply doing my sworn duty in ridding the Business and Financial Districts of the Bad Characters that for years have made Typewriters a menace to your eyesight. I have mercilessly exposed and relentlessly pursued these dangerous Typewriter Types, which are responsible for more cases of Defective Vision than all other causes combined.

"Report direct to my Headquarters, in the Oliver Typewriter Building, Chicago, any machine whose type is violating the Optical Law and I'll have the offender haled before the Court of Public Opinion."

Printype — OLIVER Typewriter

Printype is owned and controlled exclusively by The Oliver Typewriter Company



America rings with praise and applause for Printype. This superb new typewriter type has attracted more attention than any typewriter innovation brought out in recent years.

Hundreds of thousands of people have seen this new type and wondered what it was that made Printype Correspondence seem like a spoken message. There's virility, strength and charm in Printype correspondence. There's refinement and "class" and style.

Not because of its novelty—**it's inherent in the type!**

A Vast Improvement

Printype is designed in **shaded** letters and numerals, like the type in which books and magazines are printed. It is book type transformed and adapted to modern typewriter requirements.

This radical departure from the old style "outline" letters makes it possible to produce, on **The Oliver Typewriter,** a page of **manuscript** as clear and attractive as that of the finest **book.** The Oliver is the first and only typewriter that successfully **prints print.**

The Primary Reason

Printype resulted from our discovery that "outline" type, with its **sameness,** due to absence of **shading,** was harmful to the eyes.

The Silent Test

For months, without any advertising, we put hundreds of Printype Oliver Typewriters into actual service, in many diverse lines of business. We wanted the public's verdict. It came in a burst of admiration and a flood of orders that proved Printype a brilliant success.

Printype letters, wherever seen, excited the keenest interest. Business men who received their first Printype letter almost invariably answered, post haste—**"Where did you get that type?"** Thus printype captured the country without firing a single shot.

Price Not Advanced

The Printype Oliver Typewriter sells for $100. You can pay at the rate of 17 cents a day. The "Printyper" is our latest and best model. The new type adds 25 per cent to the value, but not one cent to the price. A small cash payment brings the machine. (248)

If you or anyone in whom you are interested contemplate going to a Business College, **write us first** and we will, without charge, supply you with some very valuable information on the subject.

SEND PRINTYPE COUPON NOW!

The Oliver Typewriter Company,
102 W. 9th St., Kansas City, Mo.

Tell Officer "Printype" to write me a letter and send me his Book. I'm interested.

STRONG IN SPITE OF ACCIDENT.

This capsule colt is out of 1,200 pound mare, fertilized by the semen of a registered Belgian stallion. L. R.

CAPSULE COLT SIX WEEKS AFTER FOALING.

Lee, Green County, Ill., who sent us the photo, states that the mare was injured in an accident two weeks before the colt was due, and the colt came six hours after the accident. It was strong and lively, and a good colt, as shown by the picture, made when the colt was six weeks old.

LOOK OUT FOR WORMS.

To the American Breeder:—A little precaution right now in ridding your farm animals of the treacherous stomach and free intestinal worms may save you a good many hard earned dollars before the end of the year.

It is not only positively known that these pests kill many lambs and pigs every year, but they also keep stock in a thin, weak, and half-starved condition, rendering them money losers instead of money makers.

But the gravest danger from these destructive pests is the weakening of the animals' constitutional and resistive powers, making them easy victims to hog cholera, swine plague, horse plague and other contagious diseases.

It is well known that the best way to fight off these plagues is to keep every animal in the healthiest condition so it can resist the contagion, and one of the first steps is to drive out the worms. If you do this, your chance of loss will be decreased about 90 per cent.—S. R. Feil, Cuyahoga County, Ohio.

ABORTIONS IN THIS SECTION.

To the American Breeder: There has been quite a number of abortions in this section this spring, with no apparent cause so far as known. Would not know of anything wrong until we would find the colts from the size of a cat to a full grown colt.—J. W. McConnell, Davis County, Iowa.

HAS FOUND NAVEL POWDERS O. K.

To the American Breeder:—I enclose 50 cents to pay for Stallion Service Record Book. I think your navel powders are a winner.—W. E. Tom, Campbellton, Atascosa County, Texas.

QUESTIONS AND ANSWERS.

(Continued from page 5.)

aged. It is not so material how your mare is bred, but the capsule method has been repeatedly demonstrated to give more certain results.

CAUSE OF NAVEL ILL—Do you blame a horse or jack for colts having this navel ill? I have lost two colts this spring from my old jack and they are blaming the jack for their carelessness.—Missouri Subscriber.

Stallion Service Record Book for Two Hundred Mares—The latest and best on the market, as cheap as the cheapest. It is a handy pocket size, with 224 pages of strong bond paper and a waterproof cover. It has a calendar, a gestation table and an index of twenty pages so that each mare can be found easily. Each mare has an entire page. This book can be used for several sires without carrying more than one at a time. Notice how easily it is to record the breeding of a mare and give the details. This record book is the result of the opinions of many breeders. It has no worthless advertisements in it. If you are not satisfied with it, return it and get your money, which will be cheerfully and promptly refunded to you. Price 50c each, postage prepaid. Published by

THE AMERICAN BREEDER
225 WEST 12TH STREET
KANSAS CITY -:- MISSOURI

REPLY—A sire might have a weakness that could be transmitted to his progeny that would cause the offspring to be more susceptible to this infection. This, perhaps, is very rare in live stock breeding. The great difficulty is carelessness on the part of the owner of the female in allowing her to deliver in a dirty place and not making an effort to prevent infection. There is more navel ill in some sections than others. We believe if these two colts had been properly cared for they could have been saved.

THREE YEAR OLD SERVICES—I am standing a young stallion for public service. Will be three years old the 26th of this month. He has served 20 mares since the 5th of April. I bred him to three mares the first week. Have bred him to one mare per day except Sundays. Five of these mares have been returned on the ninth day. Do you think it will be too much for the horse to breed him to one mare per day through the remainder of the season, or until about the 15th of July?—Idaho Subscriber.

REPLY—Four services a week is sufficient for this stallion. A service every other day would be better. He might get you a good number of foals, but in after years the per cent of foals would be greatly diminished.

LOOSE MARES—I have a few mares that I cannot get in foal. These mares are in good flesh and are young. I have found out that they are too loose. What can I do for them to get them in foal?—Kansas Subscriber.

REPLY—There might be many causes for these mares not getting in foal. If they are too loose it may be caused from a diseased condition which might be remedied by using the saline solution. If there is no disease present they might be fertilized by breeding them with a capsule about two days after the heat period has closed.

RIDING A STALLION—We have three full blood Belgian stallions and two of these horses we work for exercise and the other one runs in a paddock and we ride him about four miles each day. Will the riding interfere with his breeding in the way of not being a sure breeder?—Indiana Subscriber.

REPLY—This should not interfere with your stallion as a breeder.

PURULENT METRITIS—On the 26th of April I bred nine mares from two covers. The mares were returned today to be retried and four of them wanted the horse again. Upon examination I found a lot of pus in the uterus of two of them. It was of a yellowish color with small bits of thick matter mixed with it. On the 26th of April the same mares were clean. What I want to know is, could I have diseased them with capsules or was the disease there before and I not find it? I used nine day mares for the horse. What is the name of it? I cannot find anything like it in April 5th issue. Any information will be appreciated.—North Dakota Subscriber.

REPLY—The diseased mares complained of were not made so by the capsule system. Your examination, perhaps, on the 26th of April was not very complete. This experience will show why breeders should always wash their hands before breeding another mare with a capsule.

FOUR YEAR OLD STALLION—I have a Percheron horse; weight 1,700 pounds; four years old July 1. How many services can I make with my horse and not hurt him? Can I make one service a day, or can I make more?—Missouri Subscriber.

REPLY—One service a day will be sufficient.

BREEDING MARE WITH HEAVES—Will a mare breed that has the heavies?—Montana Subscriber.

REPLY—Mares having the heaves are not profitable to the stallion or jack owner. Some of them are successful breeders, but too many lose their colts. The best plan for mares having this condition is to breed them in the fall and not work them during hot weather; allow them to run on grass all summer if they show to be in foal.

HABITUAL ABORTION—What would cause a mare to slink four successive colts? What would be a preventive?—Montana Subscriber.

REPLY—Mares form the habit of abortion quite readily. One preventive in this case is to change the breeding date. If she has been bred during the spring season, breed her in the fall. This may relieve her of the conditions that have encouraged abortion before.

TUMORS—A mare was presented at my barn to be bred this afternoon. On the underside of the tail and the adjacent parts where the hair does not grow, this mare was pitted very much after the fashion of small-pox in the human family, and some of the holes were an inch deep. Along the lower walls of the vagina two or three hard objects about the size of a hen's egg could be felt. Parts were all healed and no sores any place. Will you please explain this condition? Is there any danger to the stallion in breeding this mare?—Illinois Subscriber.

REPLY—We do not understand why the skin should appear as described in this case. In case of gray mares there frequently are deposits that cause tumor growths in this locality. It is always good practice whenever any abnormal conditions are encountered to breed the mare with capsule. This method insures freedom from possible contamination of the stallion and is equally or more certain of producing fecundation.

SWEENY—I have a four year old stallion that I sweenied a short time ago. Please advise treatment.—Colorado Subscriber.

REPLY—Sweeny is a term that signifies atrophy of some of the muscles. It may be occasioned by an injury quite remote from the point of atrophy. In other words a horse may be lame in the foot and yet shrink in the muscles about the shoulder. The first thing necessary is to locate the thing responsible for the lameness and set about removing it. When the lameness is controlled and the animal begins using the muscles again they naturally incline to fill out. They can be hastened in filling out by applying stimulating liniments with friction, vesicants or even by inserting setons.

STALLION NOT SURE—I have a standard bred stallion that is not sure. He is thrifty and has good life. I am certain that he has plenty of exercise. He is a good performer; always ready and seems to cover well and stays on well. I have never permitted him to make more than two covers a day. He is ten years old. Would you advise keeping him another season or using the knife on him? He is a fine single driver. Is there much danger in altering a horse that age?—Missouri Subscriber.

REPLY—From what you tell us your stallion is in a very fair physical condition and we would advise castration and putting the animal to other work. It is not likely at his age he will recuperate to a point where he will cease to be an aggravation. If the operation is done by a skilled veterinarian experienced in castration, there should be little danger attending the operation.

DISCHARGE FROM URETHRA—I have a stallion that has a discharge from his penis. The veterinarians here call it gonorrhea, or clap, caught from a foul mare. Would like for you to give me cure for same.—Kansas Subscriber.

REPLY—It will require a microscopic examination of the discharge from your stallion to fully determine the nature of the disease complained of. Horses are not very susceptible to gonorrhea, therefore we have doubt about your animal being so affected. Inasmuch as you have a veterinarian at hand we would advise you to get him to undertake the treatment of your stallion provided he is a competent man. He should be able to handle the case better than any one who has never seen the animal.

IMPOTENT BOAR—I have a registered Duroc boar a year and a half old and he served about 25 sows this year and lately won't mount the sows. About three weeks ago was the last sow he served and he was slow then. He is rangy and tall and not very fat and weighs about 300 pounds. I let him run in a three acre pasture part of the time and part of the time I keep him penned in a yard 30 feet square and I feed nothing but corn and green barley in pasture, but the pasture has only been used about two weeks.—Kansas Subscriber.

REPLY—Your boar needs a rest and a little better care. You speak of feeding him nothing but corn and green barley in pasture. How was it before you had the green barley? We fear you have cut short the usefulness of your hog by a too exclusive corn diet. Corn is a good grain for hogs being fattened for the market, but is not suited as an exclusive ration for breeding stock. With such foods as oats, shorts, bran, oil meal, tankage, alfalfa and other bone and muscle producing food available, you should have drawn your boar's rations more from these. It may not be too late yet. Give him a rest and a complete change of diet, with access to pasture.

BREEDING TO GRADE STALLION—I purchased a two year old grade stallion the last of April; his weight is 1,100 pounds and I expect to breed 12 mares this season. I would like to feed him so he will grow as much as possible. I have prairie hay and nice millet and barley hay that was mowed and not threshed, as I intended to feed him barley alone for grain. But some tell me that would ruin him for breeding, as he would not settle mares. I would like some advice on this point. —Kansas Subscriber.

REPLY—Why are you throwing your money away by breeding to a young, untried stallion? It would be a kindness to you if some good friend would cut him before you breed your first mare. Did you ever sit down and in a business way figure out what you are going to lose by this act? The fact that there are so many good pure bred draft stallions in your state makes us emphatic in the statement that no man now days is justified in breeding to a two-year-old untried grade. The difference in the market value of the offspring will many times more than pay the difference in service price. Don't make this mistake.

LEUCORRHOEA—Mr. A. brought a mare to me to be bred. This is a ten year old mare; weight about 1,300, in good working order. She raised a colt two years ago and was bred at that time (but did not get in foal) to a grade horse handled by a green man at that business. I examined the mare and found a transparent, sticky liquid in her before reaching the womb. It was very sticky and when I washed it off my hands it was as stringy as sorghum molasses, and after opening the womb I would get yellowish lumps of pus. I would not breed this mare and Mr. A. felt rather put out about it. Is it safe to breed this mare? What is wrong with her? Would the stallion get this from her? And would he transmit it to other mares? Could I get her in foal with a capsule? Will she conceive or not? Where does all of the corruption come from? What is mereurial ointment and how is it made?—Iowa Subscriber.

REPLY—This is one of the numerous cases to which our attention is drawn almost daily, and it is largely because stallion owners fear they may offend some patron that disease is propagated, and barrenness among mares is promoted. A man that has even a limited experience in breeding mares knows that there isn't one chance in a thousand for a mare in this condition to conceive by any method of service. Then why breed these diseased victims? Why contaminate your stallion and do others a greater harm by spreading this disease to mares now healthy? The report frequently comes in that a mare has always been a regular breeder, etc., that suddenly she fails to conceive; that an examination discloses an unhealthy state, a discharge, etc. Did it ever occur to you that this was one of those healthy mares that contracted the disease from some one carelessly allowing a stallion to serve a mare such as our inquirer writes about? Don't breed this mare at present by any method. The owner should understand that she is to be given a course of treatment before it can be reasonably expected she will conceive.

DISEASED MARE—This morning I examined a mare that appeared to have something like a sugar condition of the vagina. When I withdrew my arm it had a brown sugary deposit on it that soon dried in the wind and was the appearance of light brown sugar. This mare was normal in all other respects. We tested for acid and found none. The neck of the uterus seemed perfect. We called a veterinarian and he examined the mare and found nothing wrong and could not explain the sugary deposit. This mare seems to be in perfect health and is a very valuable mare. Is about ten years old and has had four colts. She was bred three times last year and we bred her once during the fall season, but we were unable to get her in foal. Your advice will be greatly appreciated.—Indiana Subscriber.

REPLY—A diseased condition of the vagina or uterus does not always give rise to a discharge of a similar nature. This is very materially influenced by the extent of the disease, the character of the micro-organisms, etc. The genital tract should be flushed out with hot saline solutions, so frequently mentioned in these columns, with perhaps an iodine solution occasionally. The uterus should be carefully examined for the purpose of ascertaining whether or not it is involved. The fact this mare fails to conceive argues that there is something radically wrong in these parts.

VENEREAL DISEASE—I have a jack that has a breaking out something like bumps on his penis. Looks a little like blisters but feels a little hard; they look a little raw; might bleed just a little. He serves, but not so good; it appears to be a little sore. Do you think it is bad blood or do you think he could have gotten this from a diseased mare? Do you think it is safe to breed mares with him? Would like to have some information. —Missouri Subscriber.

REPLY—Your description sounds very much like genital horse pox, a contagious disease of the genitals which, if true, will mean that your jack will quite likely carry the disease to all the mares you have bred him to since being affected. This jack should be discontinued from service until well, and the parts affected should be daily washed with a one-half of one per cent creolin solution. It usually requires two or three weeks for these cases to be safe to put back into service.

POLL EVIL—I have a mare that has the poll evil; her head swelled up about two weeks ago. Please advise me what to do for her.—Missouri Subscriber.

REPLY—Take your mare to a good competent surgeon.

DISEASED MARE—I have a pure bred registered Percheron mare seven years old that has raised two colts. One sold for $500 when three years old; the other is a stud 22 months old; weight 1,650 pounds. The mare has missed twice. I bred her on April 17th and on the 19th day she had a discharge of white substance. I tried her with my own horse and she showed signs of being in heat. On the 21st day I took her to be rebred and the owner of the stallion, seeing the discharge (and I told him of it, too), injected a salt solution and found neck of womb open, but did not open it clear through into the womb or try to see if it would open or was open for fear she might be in foal. After the injection we tried her to this horse and she was not in heat, much to our surprise. This discharge still continues but not so much. Could she be in foal and have this discharge? In 21 days after breeding would the neck of the womb be closed clear through if in foal or would it be open and closed further in and the mare be in foal? If the womb is closed from the inner side could this secretion come from the kidneys?—Ohio Subscriber.

REPLY—It is quite likely that the discharge comes from the uterus and you should take the mare to some one competent to give a thorough examination and inaugurate a line of regular treatment so as to get her in condition for another season. It is not likely any good will come from an occasional irrigation. Do not procrastinate in this matter.

MANGE—I see a piece in the American Breeder concerning "mange," where you recommended the unslacked lime and sulphur, but you did not give the amount of sulphur to be used. How much sulphur should I use for the eight pounds of lime? What does the mange in horses look like? How can I tell if my stock have the mange without a veterinary examination? Could a stallion get it from mares and give it to mares that were not affected with it before, the stallion showing no signs of it? I had a neighbor's bull in my barn through the winter 12 or 13 years ago and my young stock since that time have showed scabby places which I always cured with sulphur, lard and kerosene oil, but it never has showed on my horses before. The bull was very scabby in the spring, but my stock did not show bad spots, only small ones. I have used coal tar dip on them also.—North Dakota Subscriber.

REPLY—Mange is a skin disease dependent upon a parasite for its existence. Nearly all animals may be affected by some form of the parasite and develop a mangy or scabby state. The disease cannot always be distinguished from certain other skin affections, but when it is present among a certain class of animals it inclines to spread on account of its contagious nature. The fact that a number of animals are similarly affected with a skin disease of a scabby nature helps to point to mange as the probable affection. A solution of lime and sulphur is quite effective in destroying the cause; i. e., the parasite. Eight pounds of lime (unslacked) with 24 pounds of sulphur is boiled for two

Tell Me How Many Head of Stock You Have

and I'll feed them 60 days before you pay. I'll show you how to make your farm animals grow faster, thrive better, put on more flesh on no more feed — make you more money.

I'll Rid Them of Worms or No Pay.

I'll Prove it to You as I have to these and Thousands of other Farmers.

"I was losing from three to five sheep per day when "Sal-Vet" arrived. Three days after I put it where the sheep could get at it, the losses stopped and I haven't lost a single sheep since."
Arthur Holloway,
Mgr. Monument Sheep Co.
Monument, New Mex.

"There is no doubt that "Sal-Vet" saved my entire herd of hogs. On all sides of my farm other farmers lost nearly every hog they had. I shall always aim to keep "Sal-Vet" on no hogs."
Peter V. Carey,
Prop. Lone Tree Stock Farm
Ill. Co. Stockyards, Ill.

"Sal-Vet" is a wonder working medicated salt which rids farm animals of their greatest enemies—the stomach and intestinal worms. These deadly pests are the cause of 90% of all live stock diseases. They keep farm stock in a poor, weakened, money-losing condition—they mean greater liability to contract hog cholera, swine plague and other contagious diseases. "Sal-Vet" expels these parasites, sharpens the appetites, improves digestion—makes all stock grow into profit fast. Being a salt animals like and run to it freely and THEY DOCTOR THEMSELVES.

Prices: 4½ lbs. $2.25, 10 lbs. $5, 200 lbs. $15, 500 lbs. $35. All orders filled for less than 40 lbs. or less than 60 day trial offer. Never sold in bulk, only in Trade-Marked Sal Vet packages. Shipments for 60 days' feed are based on 1 lb. of Sal-Vet for each sheep or hog, and 4 lbs. for each horse or head of cattle, as near as we can come without breaking regular size packages.

Send No Money—Just the Coupon

All I ask you to do is to fill out the coupon—tell me how many head of stock you have and mail it to me today. I'll ship you enough "Sal-Vet" to last all your stock 60 days. You simply pay the freight charges when it arrives and at the end of 60 days report results. If "Sal-Vet" does not do what I claim, I'll cancel the charge—you won't owe me a penny. Send the coupon NOW.

hours in 100 gallons of water and the affected animals dipped in the solution for about two minutes, the solution being kept at about 100 degrees Fahrenheit while being used. A second application may have to be made in about ten days.

STALLION DOES NOT GAIN—Our seven year old imported Percheron stallion, weight 1,950, does not eat enough, we think. What can we do to have him eat more? We feed one gallon of oats and three ears of corn at a feed three times a day, with good alsike clover hay; also give him a half gallon of bran (not middlings) and one half pint of oil meal once a day (with salt). Should we feed him any corn during the breeding season? He is large enough to weigh 2,200 pounds. He does not clean up the feed we do give him and we think it is hardly sufficient. We exercise him or work him at light work nearly every day.—Ohio Subscriber.

REPLY—We do not favor stallions carrying too much flesh, but on the other hand a stallion should have a disposition to put on weight if given an opportunity. We cannot object seriously to his rations unless it would be the amount of bran given. Bran as now made by modern milling processes does not have much food value. Its coarse indigestible husk causes more or less irritation of the bowels and does positive harm to some horses. We believe if the bran is reduced to even one pint and an equal amount of clean wheat middlings added to it with oil process oil meal, you will get better results. Do not force the horse to take salt. Place it where he can help himself. We do not favor any of the clovers for exclusive roughness unless they are entirely free from dust and of the very highest quality. Give the horse a well rounded tablespoonful of golden seal in his feed morning and night and three tablespoonfuls of Fowler's solution in the feed at noon.

DEPRESSION IN SHOULDER—I have a two year old Percheron stallion that injured his shoulder last winter in playing with another horse. I used to let him do so for exercise. I noticed him slip and fall several times while playing and afterwards became lame and continued so for three or four weeks in left front foot. I examined it and found a small hole or depression in the shoulder close up to the neck, straight in from point of shoulder. Looks something like what you would make by pressing tips of three fingers against it. He is not lame any more and it doesn't seem to hurt him, only it looks bad. The skin was never broken or injured at all. Do you think I could do anything for it?—Montana Subscriber.

REPLY—As long as this slight blemish does not interfere with the service of the animal we think you should let well enough alone. A good veterinarian could perhaps operate on the parts and cause the unsightly depression to fill out.

POLL EVIL—Is there any sure cure for poll evil caused by a bruise on the head two years ago?—Colorado Subscriber.

REPLY—Poll evil can usually be cured by a competent surgeon, and while a few cases may recover by other treatment, the majority require some surgical work.

MARE GIVING MILK—Will a mare get milk if she is not going to find a colt? I have a mare that we thought could not bring a colt, but she has some milk. She was bred the last time in September.—Colorado Subscriber.

REPLY—It frequently occurs that various animals will begin a milk flow and not even be pregnant. This has occurred even in sucklings and also hybrids.

NAVEL ILL—On Monday morning about one o'clock, May 5, my mare dropped a colt which appeared all right all day Monday and Tuesday morning, but Tuesday noon colt was lying down, and my wife said it had been for three hours. I got it up and it was quite lame in right hind leg; seemed sore in hock joint and hip and at night it was lame in left fore leg. Wednesday noon lame in left hind leg and Thursday morning was lame in all its feet and was sore all over. It was dead at noon. Whay ailed the colt and what would have been a proper treatment? —South Dakota Subscriber.

REPLY—You have given a description of quite typical symptoms of navel ill and it is our opinion that is the disease that destroyed your colt. Scrupulous cleanliness of stall and premises, with systematic disinfection of the navel, are the methods that prevent this disease. Colt raisers must be alert to the fact that an ounce of prevention is worth several pounds of cure in this disorder.

TAPE WORMS IN HORSES—What are the symptoms of tape worms in horses? What remedy would you recommend to get rid of them?—South Dakota Subscriber.

REPLY—This type of worm is very rare in horses and one would not be able to recognize their presence from the symptoms alone. When tape worms are known to exist a combination or areca nut and male shield fern give about the best results.

PROPER AGE TO CASTRATE COLTS—What is the best age at which to castrate colts? Is nine days old too young? If not, do the cords need to be tied before being cut off? How old has a colt to be before it is necessary to tie the cords before cutting them off?—British Columbia Subscriber.

REPLY—This question can only be answered in a general way as much depends on the type and purpose of the animal. Permitting a colt to run until he is two or three years old tends to develop him in the fore parts. This is usually desirable in draft types and less desirable in road horses. The risk of castration increases with the age of the animal, which is worthy of some consideration; also the risk to the colt itself or its mates through accident usually increases after the first year. The general experience of castrators in operating on sucklings is that scrotal hernia is frequently present, and in fact is so often met with that the general practice of castrating at this age without resorting to a special operation is not to be recommended. Everything considered, one year is the best period for the general run of colts. The most of operators use special instruments with which to sever the cord, no matter what the age.

GET A SPECULUM

if you want to know the condition of a mare's genital tract and whether or not it is diseased. A Speculum is also the only means of examining the cervix to make sure if a mare is in foal. Many an abortion has been caused which the use of the Speculum would have avoided.

This Speculum is made of good material, nickel plated, and with proper care will last a life-time. **SENT POSTPAID FOR $3.00.**

HEMORRHAGE FROM THE NOSE—I have a horse that might have the distemper. I laid him off from work for about a week and then I put him in and worked him. I noticed that he was bleeding at the nose, and when he held his head down low the more he would bleed. What is the matter with this horse and what can I do for him?—Iowa Subscriber.

REPLY—Bleeding from the nose is a very suspicious symptom of glanders and you should lose no time in having this animal examined by a competent veterinarian, and if needed the Mallein test should be applied.

DRY AND SCABBY FEET—One of my jacks, a four year old, has bad feet. (I suppose it is caused by him standing in manure.) The front parts of his forefeet are rough and scaly and cracked. Please give recipe for hoof dressing.—Texas Subscriber.

REPLY—It is likely that you are right in the cause of the condition of the jack's feet, inasmuch as the fumes of the ammonia arising from heating manure are very injurious to the hoofs of animals. Now that you know the cause do not ever be guilty of a repetition of the offense. First smooth up the feet lightly with a rasp and sandpaper, then apply large, warm, linseed meal poultices for three or four days so as to fully soften up the feet. Following this, apply the following twice a day, and after about ten days, once a day; Neat's foot oil, three parts, oil of tar, one part; mix and apply with a small paint brush to all parts of the hoof.

CASTRATING AGED STALLION—I have a trotting bred stallion that I intend castrating after the season closes. This horse is ten years old. I am told by doing so it will affect this horse's wind. Is there anything to it?—Indiana Subscriber.

REPLY—No.

BREEDING WILD MARES—Will the capsule system work on unbroken mares? Where I live in Western Texas the wind blows quite a great deal and we have no barns or sheds in which to operate the capsule system. We have something over 100 good mares, mostly unbroken. Would have to put them in chute to use capsules. I have a registered Percheron horse and a good jack. Will get a good per cent of foals from natural service. Do you think the capsule system would work under these circumstances?—Texas Subscriber.

REPLY—The best results obtained with wild mares is to break them to a chute. That is, put them in a chute once or twice a week and handle them

CRUSHED OATS
ARE FAR BETTER FOR HORSES
and cattle than ground feed. Get a "NATIONAL" Oat Crusher. Up-to-date stock farms are rapidly adopting crushed feed. Hand and power sizes. Send for catalog. Agents wanted.
W. R. BELLOWS CO.,
97 Warren St., New York.

there a little, being very quiet with them at all times. If there are no "outlaws" in the bunch they usually get so they may be handled enough to be bred with capsules without much injury. You can build a little barn near the chute where the natural service can be made on a gentle mare in order to get the semen. The semen could be kept in the enclosure where the capsules could be filled. After a capsule is filled it should be inserted into the mare quickly so that the wind will not be very detrimental. Unless you are going to breed some outside mares it would not be necessary to adopt the capsule system only to use on your shy breeding mares. A stallion and jack should handle 100 mares very easily with the natural service by only allowing one service at each heat period.

A YOUNG STALLION—I have a registered Percheron stallion of our own breeding; will be two years old June 1, 1913. I am using him on a few mares, not over eight or ten. Have bred four to him now. Please give me your experience as to using colts of his age. I would not in any way injure the colt as to growth or future usefulness for much more than what I am getting out of this season. The colt weighs now about 1,540 pounds; a little over 23 months old. Is this an average weight for that age? I have a two year old filly, half sister to our young stallion. What effect would I get by mating them? The colt is strong where the mare is weak, so would cross just right. I know it is wrong to inbreed, but know of no horse in the neighborhood to mate with her right.—Nebraska Subscriber.

REPLY—While your colt is large enough for his age, yet you could have perhaps made money by not using him this year. He may not continue to grow as he is liable to be fretful. Short two year olds are not very sure, especially when developed rapidly. If there is no other stallion in that section of the country suitable, you might try the experiment of line breeding in this case.

FOUR YEAR OLD JACK—I have a four year old jack and am serving one mare a day and on Saturdays sometimes two, and rest him on Sundays. Have done this for four weeks and still at it. I wish you would inform me if that is too much for a four year old jack. He is Mammoth bred. We give him lots of exercise on the road each day, and he runs loose in a small lot. Some say that is too much and some say he will serve two a day. I don't want to hurt him for next year. We are taking extra good care of him.—Oklahoma Subscriber.

REPLY—If your jack is well developed and closely made, one service a day should not be too many. You will find it very profitable to examine every mare closely so as not to serve a diseased or doubtful one. If your jack could skip a day occasionally it might be profitable to you in after years.

BREAKING A YOUNG JACK—I have a three year old jack to break to cover and would like for you to give me a plan to break him. He is a nice one; height, 14½; black; light points; good bone and good ear.—Missouri Subscriber.

REPLY—The time to begin training a young jack to use on mares is at weaning time, which should not be later than six or seven months of age. After being weaned he should never see or smell a jennet or a mule. His companion should be a filly of about the same age and of a timid nature. When he begins to get rough with the filly he should then be separated and put into an enclosure where he can take plenty of exercise, and have green grass with plenty of feed and good water. When he is old enough to begin service, the one who has been caring for him should break him. No one should be allowed to speak harshly to this animal at any time. Whipping or jerking is also prohibited. When the first service is to be made great care should be taken to see that it is done right, for a jack has a wonderful memory and is liable to always want to duplicate that particular service. A small mare in good heat is the best. Bring the jack out and let him smell of the mare; as soon as he gets ready, encourage him to mount. Be careful not to offend him. Sometimes a "cluck" or a little start will cause him to make the leap; sometimes one may jab him in the ribs with the thumb just a little. During this time the mare should be held perfectly quiet and not allowed to make any disturbance. Jacks at this age are usually very timid. If he does not get ready within a very short time, take him back to the stall; take the bridle off and turn him loose a little while. It is better in most cases, however, not to use a bridle at all on a young jack, because many of them are afraid of it and some of them have never had a bridle on. In breaking a young jack it is advisable to take plenty of time and try them several times, being very quiet and gentle and exercise patience at all times. One must not expect a young jack to come right out and make the mount like one thoroughly broken.

WASHING A STALLION—After each service with my jacks and stallions I wash them with one quart of warm water with one teaspoonful of creolin as a disinfectant. Do you think the creolin will kill the fertility of the spermatozoa in the next service? One of my neighbors has a good stallion that was ruined by a diseased mare; now he has ruined 12 or 14 mares, and I want to be on the safe side is the reason I ask this question.—Oklahoma Subscriber.

REPLY—Sterilized water will get just as good results in every case and is not dangerous except that it should not be cold. Water at 105 degrees would perhaps be best in this case. You cannot use disinfectants on your stallion strong enough to kill all the disease germs unless it injures the penis. The best plan in a case of this kind is to absolutely refuse to serve a diseased mare. You will find a good speculum a very necessary instrument in your neighborhood.

DIAGNOSING PREGNANCY—Please advise me how to tell when a mare is in foal after she is three, four or five months gone.—North Carolina Subscriber.

REPLY—The most successful plan is to make a rectal examination. This, however, should only be done by those who have had special instruction in such work.

TOO MANY SERVICES—What is the matter with a jack that, when you let him serve as many as three mares in two or three hours, and he will raise another erection in, say five minutes? Is he getting run down?—Arkansas Subscriber.

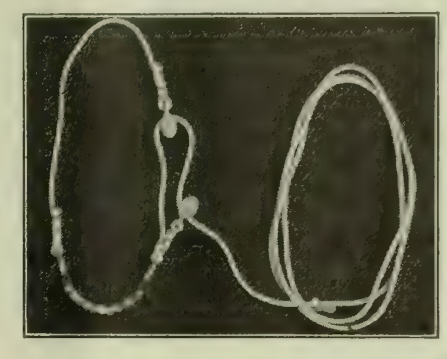
REPLY—You should get a microscope and examine the semen a few times in order to tell whether your jack is "run down" or not. If you follow this method of breeding long you will not have any jack, or at least not one that will get colts. The fact that a jack can get an erection is not evidence that he is a producer. When an erection is present so soon after this number of services it is quite likely that he does not discharge, more especially if this is his regular number of services each day.

MARE LOSES COLTS—I have a good Percheron mare weighing between 1,800 and 1,900 pounds, that has failed to raise a colt. I got her four years ago. She had raised a good colt that was two years old when I got her, but lost the next one the fall before, caused, they thought, from pulling out a stuck load of sand. I bred her three times the season of 1909 with no effect; four times in 1910 with no results; once, August 22, 1911, with an impregnator; she stuck and carried the colt until March 28, 1912. In pulling a heavy load the harness broke, giving her a strain; she lost the colt the next day. She was bred April, July 1 and August 8, 1912, the natural way; was handled carefully and not worked at all from November 27 to April 7; was worked very carefully since, but lost her foal May 10. Would it be of any use to try again?—Illinois Subscriber.

THE RIGHT WAY

IN ALL CASES OF DISTEMPER, PINKEYE, INFLUENZA, COLDS, ETC., of all Horses, Jacks, Mules, Brood Mares, Colts, Stallions, is to

SPOHN THEM



On their tongues or in the feed put Spohn's Liquid Compound. Give the remedy to all of them. It acts on the blood and glands. It routs the disease by expelling the disease germs. It wards off the trouble no matter how they are "exposed." Absolutely free from anything injurious. A child can safely take it

50 cents and $1.00; $5.00 and $10.00 the dozen. Sold by druggists, harness dealers, or sent, express paid, by the manufacturers.

IS YOUR VALUABLE ANIMAL INSURED
AGAINST DEATH FROM DISEASE OR ACCIDENT?
IF NOT, DO NOT CARRY YOUR OWN RISK. NO MAN IS RICH ENOUGH TO DO THAT. LET US SEND YOU INFORMATION AND TESTIMONIALS.
NORTHWESTERN LIVE STOCK INSURANCE COMPANY, DES MOINES, IOWA

REPLY—Breed this mare in the fall and watch her closely. When she shows signs of abortion, use the Black Haw treatment.

"THOROUGHBRED"—As the word "Thoroughbred" has been some bother to some people here in my country (some say that this word means nothing but a running horse, and nothing else, and some say that it means any kind of a pure bred). I would like to hear your writeup on this word as to what it belongs to.—Nebraska Subscriber.

REPLY—The word "Thoroughbred" applies to running horses, for which there is a live stock registry. It should not be used when speaking of equines in any other way. The word "pure-bred" is just as appropriate for other classes of live stock.

Don't Have a Blind One

BREEDING APPLIANCES OF ALL KINDS

THE IMPROVED CARLSON SEMEN EXTRACTOR AND CAPSULE SYRINGE

This extractor has been improved so that it is much easier to use. The proper temperature can easily be maintained. Anyone should have good results with this instrument by following the directions carefully. This is the only instrument made that has been successfully used for getting the semen from the uterus. We believe this instrument with its improvements will make it possible for any ordinary breeder to use the capsule system successfully. It has a soft metallic point that will stand bending a thousand times. All necessary directions will be sent with the instrument.

SPECIAL PRICE ON EXTRACTOR AND CAPSULES

Until further notice we will sell 1 box of 50 pointed breeding capsules (price, $1.00), and one Improved Carlson Semen Extractor, complete as described above (special price, $6.50), ALL FOR $6.50.

Pointed Breeding Capsules

We have the only capsules made especially for horse breeding. Some capsules do not dissolve, leaving a foreign substance in the uterus which will prevent conception. Other capsules are too flimsy to use for this purpose. You cannot make any mistake by buying capsules from us as we only have one kind. We have them boxed with 100 in each box. The box is tight so they will be clean. These capsules are properly baked and all bacteria killed before they are mailed. Always keep the lid on the box when not in use.

Price per box (100), $1.50.

Bulb Impregnator

This is the best bulb impregnator on the market. Some dealers sell for $5 and $6.

Price, $2.00.

Veterinary Thermometers

This thermometer is recognized and used by the leading veterinarians for taking the temperature of animals. It has a metal case which insures it against breaking and will last a life-time. It has a small chain with pin in it that may be fastened to the vest pocket and carried with safety.

Price, $1.25.

Thermometer

Tested and used for keeping water at the right temperature.

Price, $1.00.

Breeding Hobbles

We have heretofore handled breeding hobbles made by reputable firms, but we have received so many complaints that we are now manufacturing our own hobbles. They can be adjusted to fit a small pony or the largest draft mare. We believe these are the only hobbles made large enough for draft mares. Most hobbles are made to fit the common race mare.

Price, $8.00.

Emasculator

This emasculator (improved style) is made by the Kny Scheerer Co., and bears their trade mark. It is guaranteed to give satisfaction. If it breaks within one year or gets out of order, return it and get a new one. This instrument is made of the very best steel. It is the latest method, only having three pieces and can be taken apart very easily and thoroughly sterilized. It operates perfectly. Price, $7.00.

Microscopes

For use in testing the semen of stallions or jacks. Magnifies 500 times and is used by veterinarians and physicians. Price $35.. Boxed in fine case. These instruments are of great value in the breeding business. Through them you can see for yourself and show your mare owner the live spermatozoa of your sire.

Curved Metal Impregnator

This instrument is sold by other dealers for from $5 to $6. It is nickel plated, about 22 inches long, with a glass tube in it.

Price, $4.00.

Breeders' Bags

Three sizes, small, medium and large. Stallions weighing 1,200 or 1,600 pounds usually require a medium size. These bags are guaranteed not to tear from any cause before March 1, 1914. If they do tear before that time return the top part with our stamp on it and 35 cents in cash and we will send you a new bag.

Price each, $1.00.

Directions for Ordering

Send money orders or draft as exchange is always charged on personal checks. Always name your express office as well as your post office address in order to insure prompt delivery.

POSTAGE AND EXPRESS PAID ON ALL ORDERS.

BREEDING APPLIANCES OF ALL KINDS

THE IMPROVED CARLSON SEMEN EXTRACTOR AND CAPSULE SYRINGE

This extractor has been improved so that it is much easier to use. The proper temperature can easily be maintained. Anyone should have good results with this instrument by following the directions carefully. This is the only instrument made that has been successfully used for getting the semen from the uterus. We believe this instrument with its improvements will make it possible for any ordinary breeder to use the capsule system successfully. It has a soft metallic point that will stand bending a thousand times. All necessary directions will be sent with the instrument.

SPECIAL PRICE ON EXTRACTOR AND CAPSULES

Until further notice we will sell 1 box of 50 pointed breeding capsules (price, $1.00), and one Improved Carlson Semen Extractor, complete as described above (special price, $6.50), ALL FOR $6.50.

Pointed Breeding Capsules

We have the only capsules made especially for horse breeding Some capsules do not dissolve, leaving a foreign substance in the uterus which will prevent conception. Other capsules are too flimsy to use for this purpose. You cannot make any mistake by buying capsules from us as we only have one kind. We have them boxed with 100 in each box. The box is tight so they will be clean. These capsules are properly baked and all bacteria killed before they are mailed. Always keep the lid on the box when not in use.

Price per box (100), $1.50.

Bulb Impregnator

This is the best bulb impregnator on the market. Some dealers sell for $5 and $6.

Price, $2.00.

Veterinary Thermometers

This thermometer is recognized and used by the leading veterinarians for taking the temperature of animals. It has a metal case which insures it against breaking and will last a life-time. It has a small chain with pin in it that may be fastened to the vest pocket and carried with safety.

VOLUME 6. KANSAS CITY, MO., JUNE 20, 1913. NUMBER 11.

Closing the Breeding Season

Danger From Sudden Termination of Service. Means of Keeping Up Condition of Sires Through Idle Season. Working Stallions; Drawbacks and Advantages.

In some sections the spring breeding season has closed, while in others it will continue until late in the fall. A sire will give better results by being used moderately through a longer period than to have too many services during a short period. At the close of the breeding season the services should not be stopped abruptly—a few scattering services is much better. Unless a sire is handled intelligently at this time, he is liable to form bad habits, among which is that of masturbation, one of the difficult problems in horse breeding.

What to do with stallions or jacks after their money making activities have ceased for the year, is a problem many are considering at this time. Too many of them are stored away in dark dungeons without any attention. A better method is to build a corral, allowing the sire to have plenty of fresh air and sunshine, neither of which are very expensive, but which are absolute necessities for the best results.

A corral may be made with a few planks at the bottom and woven wire at the top. This fence should be made substantial, inasmuch as it has to stand against the strength and the disposition of an entire animal. The larger this enclosure the more value it will have for the purpose intended. If it contains some pasturage, this will still add to its value. The location of such a corral should be high and dry. It might not be objectionable to have this located near a main thoroughfare unless the animal is of a very nervous temperament. If other stock are liable to get close enough to cause trouble, an outside fence ten or twenty feet back would prevent such difficulty, excepting in case the animal is a jack; then arrangements should be made to keep all jennets and mules out of sight.

One of the things to remember in building a corral for either a stallion or jack, is that he is liable to rear up on the fence, or he may paw or kick and be injured. This can be prevented by placing a pole fence on the inside about four feet from the main fence. These poles should be bolted on posts with the smooth end (head) of the bolt next to the stallion. The pole should be about three and a half feet high. Everything connected with this pole fence should be smooth so that the animal will not be injured. This will prevent either a stallion or jack from pawing into the fence or attempting to jump over it. In case he should run and slide under this arrangement, he can be led out between the two fences to a gate and be liberated.

No breeding or teasing of any kind should be done in this enclosure and it is best to keep the animal as quiet as possible at this time. This enclosure should be kept as free from manure and filth as possible. The shoes, if there are any, should be removed, allowing the feet to assume their natural state. It might be well to watch the animal during the first liberation, as in the case of a stallion he might be inclined to run for a while and get too warm or might fall. This arrangement will not cost much money, and it will afford the very best of health for a sire during the summer and fall months. A hay rack may be erected, also a feed box, so that any member of the family can feed the animal without going into this enclosure. His feed, however, should be regular, both as to time and amount.

A barrel may be located at a convenient place in this corral where it can be filled from a well. This affords an opportunity for the animal to drink at his leisure. This barrel should be cleaned once every week or two, unless the water used was rain water, and in that case it should be cleaned more often.

A barn is not a necessity during warm weather. It is much better for a stallion or a jack to have plenty of fresh air and sunshine than to be protected from the inclement weather during the warm months, unless it should be an animal subject to rheumatism or similar conditions. Jacks, especially those that may have had rheumatism or laminitis (founder), should be protected from damp, rainy weather.

A barn may be erected on the north side of this corral and the sire allowed to use these premises during the entire year. It is not necessary that this barn be expensive; it may consist of one stall. This would afford an opportunity for the animal to run in and out at his leisure. If there are several sires, different stalls may be erected for each one, using this same enclosure. But in that case substantial doors should be erected so that all except one could be thoroughly bolted in their own stall while one is exercising.. In this fashion each animal might be assigned a certain part of the day. In case of a stallion and jack the stallion might be let in the lot during the day time and the jack at night. This plan would be especially fitting during the hot weather, as the flies would not bother the jack so much at night while taking his exercise.

In case a sire was to be prepared for exhibition at a later date, green feed is very cheap and effective. This should be started gradually, first by cutting a little grass the first day, and increasing it gradually. The grass should not be clippings from a blue grass lawn. This is very dangerous to feed, as it is liable to clog in the stomach and more especially with animals not having much exercise. After an animal is accustomed to plenty of green grass, one stalk of fodder may be given the first day, two the second and increasing a stalk a day until the animal is consuming a reasonable quantity. As the corn begins to ear out, judgment must be used as to the amount. Sickness might be the result if too much green feed is given.

Those in position to work a stallion correctly might find this a very profitable occupation for such an animal. It must be remembered that when a valuable stallion is worked, it must be brought into this exercise gradually, not being accustomed to much severe exertion. Most draft horses have been developed rapidly, and without much exercise. The feed should be regular.

One of the important things in working a stallion is to always remember that a stallion is in the harness and that he is liable to take a spell at any time, even though he has worked nicely for months. Something may come up which the attendant may not notice, yet it might excite the stallion to the extent of causing serious damage.

In breaking to work a young stallion which has been used only for teasing and serving mares, one must first teach him that he is to be closely associated with horses without performing either one of these duties. This is best done by leading him close to a mare and allowing him around her until he finds that he is not allowed to bother the mare. It is usually a good plan to break a colt to drive single by putting a line on each side of him and forcing him to go ahead; teaching him to start and stop and to be bridle wise. After he thoroughly understands what is wanted, he may be hitched up by the side of a big, strong, gentle mare, that is in foal. A special rein or rope should be run through his bridle and two or three good strong men should take hold of it the first time as he is liable to get frightened and run away. A strong iron jockey stick should be buckled into his outside bit and at the top of the hame of the mare so as to keep him from getting his nose over to the mare. This will also help the mare to guide him.

The first lesson should be a very short one, especially during hot weather—a mile might be sufficient on a warm day. The distance can be gradually increased. Some men have found it profitable to have a good, substantial hitch rack where both of them may be tied while hitching and unhitching.

Quite a surprise has come to some breeders who have gone to a considerable expense in preparing to break a young imported stallion only to find that the animal is well broken, excepting that he is a little awkward with American harness and language.

After a stallion is broken to work and thoroughly accustomed to the every day use of harness, his digestive organs become in about as good condition as any other work horse. There is not much more danger of him getting sick than of any other animal in such work, but care must be taken as to the amount of work, feed, water and general management. It should be remembered that when a stallion is at labor that the value is not in the amount of work he does, or that the owner is trying to make him earn his feed, but that the object is to keep him in the right condition to make him a good producer. Ordinarily the watching and extra care necessary for a stallion would offset the amount of real labor done, so that in the end if it is labor that is wanted, a mare or a gelding might be just as profitable. A good, big stallion, however, properly handled, can do an enormous amount of work where everything is going satisfactorily.

The working of stallions has always been a debatable question. Our opinion is that for the average breeder a large enclosure of one or two acres for the exclusive use of a sire, is better than making a work horse out of him, especially when we take into consideration the extra care and the chance of sickness, or accident, or finding an occupation suited especially for working stallions

SPAN OF COMING 3-YEAR-OLD-MULES.

Sold by T. E. Collins of Republic County, Kansas, for $550. They were 16 hands, 1½ inches high; weight 2700 pounds. The buyer later refused $600 for them.

Still Count On A Big Wheat Crop

The government crop reporting board at Washington still figures on a great crop of wheat. Its estimates made June 1 (and which, judging from weather conditions since that time, should be about on a par with present conditions), call for 14,000,000 bushels more wheat than the final estimate for 1912, which was a total of 730,000,000 bushels. These figures are determined after allowing for some striking declines in winter wheat condition, which took place during May. Among the most striking and important of these is that of Kansas, which showed a decline of 19 points in May. As Kansas is credited with having 21½ per cent of the entire winter wheat acreage (twice as much as Nebraska, the next state), it is remarkable that the decline should still leave prospects of a total winter wheat crop of 492,000000 bushels, or 62,000,000 more than the big crop of 1911. From the report sent out by the Department of Agriculture, and from which we have taken the above items, we select the few tables on condition, production and distribution of wheat and other cereals, which are presented below:

ESTIMATED YIELDS (INDICATED BY THE CONDITION OF BROPS ON JUNE 1, 1913), AND FINAL YIELDS IN PRECEDING YEARS, FOR COMPARISON.

ALL MEATS PUT UNDER THE FOOD AND DRUGS ACT.

The most radical and far-reaching extension of the Foods and Drugs Act probably ever made went into effect June 16, by the unanimous vote of the secretaries of treasury, agriculture and commerce. On motion of Secretary Houston, acting under a far-reaching opinion of the attorney general, and secretaries of the treasury and of commerce joined with the Department of Agriculture in putting domestic meat and meat food products for the first time fully under the provisions of the Food and Drugs Act. For the first time, therefore, manufacturers of meat foods will now be required to comply with the Food and Drugs Act as well as the meat inspection law.

This action was taken by revoking Regulation 39 of the rules and regulations for the enforcement of the act, which was adopted October 17, 1906, and since that time has specifically exempted meats and meat food products and their producers from the operation of the Food and Drugs Act.

The revocation of Regulation 39 now gives the Department of Agriculture the power to treat meats and meat food products exactly like any other food in interstate commerce. The change, however, in no way interferes with the powers of the Department of Agriculture conducted under the meat inspection law. It simply brings meat under the food act, as well as under the meat inspection law, and thus gives the government control over meat foods, not only in the federally inspected establishments, but after the meat product has left such establishment on an interstate journey.

Under the meat inspection law alone, meat inspectors had absolutely no power to seize meat or meat food products that had become bad or had been adulterated after they left a federally inspected establishment. The only remedy possible under the meat act is to proceed criminally against anyone selling bad meat, but even in this event, bad meat cannot be seized nor its sale prevented.

The Department of Agriculture can now seize and prevent the sale of bad or adulterated meat, once it has crossed the state line and remains in interstate commerce.

FROM FIVE JENNETS; SIX JACK COLTS.

To the American Breeder: I have thought for some time that I would drop you a few lines but I have been a very busy man. I am raising jacks. I have five jennets that have brought colts from my jack so far this spring, and they have foaled six jack colts. How is that for a record? Every one so far has brought a jack, and my old jennet that is 24 years old (that I have sold over $5,000 worth of jacks from) brought two jack colts. Now I don't know what you folks up in Missouri call raising jacks, but I call that good for Texas. I have a lot more jennets to foal this summer and fall. I sold a 2-year-old by Longfellow this spring for $1,200 and another same age for $1,000 cash. They are all looking for the good ones.—S. L. Green, Hunt county, Texas.

TO REPAIR AND MAINTAIN ROADS

The making of good roads is one of the most important duties of the American people and their prompt repair and careful maintenance is essential. There is probably no subject in which the progressive farmer is more deeply interested than that of having roads connecting him with his markets over which he may be able to haul the greatest possible load. Good roads, like all other good things, are too expensive to build and of too much value to be neglected.

The office of public roads of the Department of Argiculture has published a bulletin on "Repair and Maintenance of Highways." This bulletin does not treat the subject of road building, but takes up the repair and care of roads after they are built. All classes of roads, from the natural earth road to the macadam roads with bituminous surfacing, have received attention. The action of automobiles on road surfaces is explained. The systems of road management in Massachusetts, New York, England and France are given with tables of costs.

FOUND IT WORTH WHILE TO BECOME POSTED.

To the American Breeder:—I have just been reading the letter which W. E. Lovelass of Beckham County, Okla., has written you in regard to information on breeding mares. If he will read every copy of the American Breeder and study them, and attend a term of school, he will find how much he did not know. Last year was my first year in the horse breeding business; got about 50 per cent of colts. Mares kept coming back for service and I began to think there was nothing in the horse breeding business. But last winter I went to the Graham Scientific Breeding School and also had Professor Cudd come to my place and lecture to the mare owners, and this year I am doing a splendid business. Have bred as many as four mares at a time and have only bred a few mares the second time. I bought a full line of instruments and examine every mare. Have had five diseased mares that I would not have served at any price, and by keeping my horse free from infected mares, think I will be able to get about 80 per cent of foals. I have a few copies of the American Breeder that I would not take $25 for. I want to thank Professor Graham for the lessons which were published in the Breeder this spring, as they are just to the point.—Carl O. Williams, Tipton County, Ind.

COLTS "GO OVER" IN FRONT.

A Kentucky subscriber is asking for a plan by which he can keep the newly born foals from "going over" in their front legs. He states that nearly every year he has from two to five colts that do not stand up properly; some of which get down and die.

Every breeder, and especially stallion and jack owners, might do well to have a blacksmith make a brace for this special purpose. It should be made of good heavy material—perhaps part of an old wagon tire would be cheapest, and about the right weight. A blacksmith should be employed to make this appliance. It should begin at about two or three inches below the knee cap and run down the front of the leg and have the correct angle at the pastern and the front of the hoof; it should extend to the ground and be made in just the right position for a normal foot and leg. The bottom should be bent back to about two inches and a circular piece should be welded in the bottom for the foot to rest in. This should be made to fit the foot of an average foal in that section.

At the top of this brace a ring should be bent so as not to cause any irritation or allow anything to catch on it. A good supply of cotton batting should be on hand. Put the cotton between the brace and the leg from one end to the other, several layers think. Then take a long bandage, such as race horse men use, beginning at the bottom and bandage the foot and leg snugly to this brace. Not tight enough to interfere with the circulation, but close enough to keep the brace in its correct position. This bandage should be changed twice or three times the first day and once or twice the second day, gradually leaving it a little looser. After a few days of good treatment the colt should be able to stand without this support.

The mare should not be worked, but

should be in a small yard where the colt can take a little exercise. This usually relieves this difficulty and is not expensive. This brace can be loaned to the owners of weak colts and be of much service in this direction.

PRIZES FOR SHIRE HORSES.

The bureau of animal industry of the United States Department of Agriculture is informed by Mr. J. Sloughgrove, secretary of the Shire Horse Society of England, that the council of his society, desiring to encourage the owners and breeders of Shire horses in America, have resolved to offer ten gold challenge cups, valued at $250 each, from the year 1913 to 1917, inclusive.

Two of these gold cups will be annually awarded to representative American shows in rotation during the five years that the scheme is in operation.

The council has selected the International Live Stock Exhibition at Chicago for its offer in 1913, and the gold cups will be awarded (a) for the best registered Shire stallion, (b) for the best registered Shire mare, duly certified by the official veterinary officer as sound and free from hereditary disease.

Horses entered for these cups must be registered or eligible for registration in the American Shire Studbook.

Breeders of English Shire horses in the United States will no doubt be interested and encouraged by this recognition of Shire breeding in the United States by the parent society.

MODERN METHODS MAKE WAY FOR MORE GOOD STOCK.

To the American Breeder:—I am just going to write you a few lines to let you know that we (Mr. Janke and myself) are still among the living. We are right in the thick of breeding and do not find so much trouble to breed with capsules as formerly. Almost every farmer has now heard of it or has seen a colt or two produced by the capsule method. We are coming back to the school this fall and will bring some more with us. We are having an easy time keeping the water at 100 degrees and are also learning something by using the speculum; that alone is worth a great deal. I am very well pleased that I took time to attend your school.

We want to buy a good jack and would be pleased to have you tell us where we could get one. Of course the season is about closed, but a person could buy enough cheaper now to offset the additional cost of keep until next spring. We will also have to have a first class Percheron for another year and we propose to put in enough money to get a good one. With the best of wishes to you and to the Scientific Breeding School, I am as ever, W. F. Dusell, Chippewa County, Minn.

FIRST COLT AT 35 YEARS.

To the American Breeder:—Excepting that for the first ten years of her life Dolly belonged to my brother-in-law, John W. Falls of Memphis, Tenn., his printed article is substantially complete and correct:

"Dolly Dunn, a standard bred mare, 35 years old, belonging to Dr. J. S. Dunn of this county, foaled her first colt this spring, and thereby broke the world's record for the breeding age of mares. No one in this section of the state believed that a mare 35 years old would foal. But Dolly acted just like any mare mother and she and her colt are doing fine.

Dolly has been with the Dunn family thirty-one years. The sire of her colt was Clay Gentry, a 2:10 stallion brought to Warren from Tennessee by J. A. Watkins. The colt has been named Dunn Gentry and it is hoped that it will begin a new strain of horse blood like George Wilkes, the only foal of Dolly Spanker, well remembered by the older horsemen throughout the country."—J. S. Dunn, Bradley County, Ark.

Questions and Answers.

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

THREE SERVICES A WEEK—Would you consider it an injury to a three year old stallion to stand him for a fall season of two months, giving him no more than three services a week? This is a strong, vigorous stallion, that was given 16 services last season from April 30 to October 10; no two services closer than a week apart. This stallion is worked in harness several days each week, but in spite of his apparently good physical condition, about half the mares so far have been returned. Three services per week are given. Has the cold, belated season much to do with this matter? In other words, is this complaint general this year? One thing I am sure of, and that is, many mares in this vicinity are diseased. Some react to the litmus test while others have the uterus filled with pus. I am satisfied every stallioner should examine all mares before breeding and that said advice by the editor of the American Breeder was well founded.—Ohio Subscriber.

REPLY—We believe you will be safe in making a fall stand with your stallion not to exceed three services a week. There has been some complaint about mares coming in heat about the 30th day. This has been a very peculiar spring in some localities. It has been both very cold and exceedingly hot in the same locality with very changeable temperature. Watch your mares closely as to their condition.

LIFE OF SPERMATOZOA—What evidence have we bearing upon the length of life of sperm cells This matter is of importance to me in my breeding operations because if the length of life is short, we would seriously consider the plan of breeding a mare with a capsule every day the period of estrum lasted in order to have living sperm cells in waiting when the ovum of the female is liberated. You advise breeding every other year mares with capsule on the seventh day. Is this because the ovum is liberated about that time and dies before the ninth day, when most healthy mares will receive the embrace of the stallion, or is there a better explanation to be given? In our swine breeding operations we aim to breed all sows the second day of heat. It has been my observation that if a sow remains in heat four or five days, such sows usually fail to conceive at the first service. If the life of the sperm cell is short, the reason is plain. If not, what explanation can be given?—Ohio Subscriber.

REPLY—Several authentic cases have been recorded where live spermatozoa has been found in mares from 18 to 21 days after service. The first heat period following delivery is a peculiar condition; it seems to be some different from the regular heat period. We are not able to explain just why mares conceive better on the seventh days than at a later period, but this has been the observation of many breeders. You will find that there is much difference between swine and horse breeding. The life of the spermatozoa of a boar is very short.

BLOODY MILK—I would like to ask if you have a remedy for a cow that gives bloody milk. If so, will you please state cause and cure.—Washington Subscriber.

REPLY—Bloody milk is usually induced primarily by an injury, and is aggravated by rough manipulation while milking. If one will be very careful while milking such an animal the annoyance will usually subside in a short time.

BREEDING OUT OF HEAT—Will you please tell me what to do for my filly, Nina Belle. She was five years old Decoration Day. She took the horse when she was three years old and four years and has never had a colt. She never shows when in heat. The only time we can tell is when she is loose in pasture with a saddle gelding. Then when we take her to the stallion she won't let him serve her. She fights like a tiger. We work her with a stallion (half brother to her) and she is very quiet and shows that she is in heat, but when we take her to the stallion she won't let him serve her, even with the hobble on. This filly is a full blood Percheron; registered and a good worker. She weighs about 1,600 pounds. We would like to have a few colts from her.—Montana Subscriber.

REPLY—Breed your mare with a capsule as soon as you can. Do not wait for a heat period. Be sure the operator understands his job. It is not necessary that a mare be in heat to get with foal.

RUPTURED COLT—I have a horse colt about two weeks old and when born had two large testicles hanging down like a five year old stallion. I suppose it is a rupture of some kind. Some tell me to leave him alone and they will all go up and disappear in a short time, but it is growing and worse than it was. What is the best thing to do for him? He seems to be doing well and feels good, too. His mother has the scours and has had them for one year or more. Her bowels are too loose and her manure is very thin and watery and it seems like the feed or grass is not half digested or chewed. What can be done for her?—Nebraska Subscriber.

REPLY—Have the colt castrated by means of the covered operation by a skilled surgeon. Also have the operator look after the condition of the mare's teeth and correct them as well as put her on suitable tonic treatment.

PYOMETRA—I had a mare brought to my barn yesterday to breed. She is eight or nine years old; looks as though she has raised colts in fine shape; hair looked good. On examining her I found her cervix plugged up; it had a membrane growing over it. I broke it open and she discharged at least a gallon of liquid of a yellowish white color, or about the color of the second or third milking of a fresh cow. I refused to even breed her with capsule. What is the matter with her and what can we do for her? Shall I breed her after a while?—Colorado Subscriber.

REPLY—This mare had an infected uterus and the discharge was largely pus. You did the right thing in not breeding her by any method as no sane man could hope that such a mare would conceive. It will require a long course of irrigation with antiseptics in order to get this mare sound.

LEAKING AT THE NAVEL—I have a colt nine days old and when the kidneys work some water drips out of navel. Please let me know at once if you know of anything to cure it.—Kansas Subscriber.

REPLY—It would appear that the

Stallion Service Record Book for Two Hundred Mares—The latest and best on the market, as cheap as the cheapest. It is a handy pocket size, with 224 pages of strong bond paper and a waterproof cover. It has a calendar, a gestation table and an index of twenty pages so that each mare can be found easily. Each mare has an entire page. This book can be used for several sires without carrying more than one at a time. Notice how easily it is to record the breeding of a mare and give the details. This record book is the result of the opinions of many breeders. It has no worthless advertisements in it. If you are not satisfied with it, return it and get your money, which will be cheerfully and promptly refunded to you. Price 50c each, postage prepaid. Published by

WHAT HAVE WE LEARNED?

During the early settlement of this country, history teaches us (as well as the experience of men yet living) that the per cent of foals was much larger than at the present time. In fact, nearly every mare of a breeding age could be depended on to produce a living, healthy foal. As time progressed in this broad, fertile prairie, larger farming machinery with seats to carry the driver's added weight, have been brought into existence. The change has been so gradual that we have not noticed it.

When several mares are hitched to a heavy riding implement the pilot does not see the necessity for stopping occasionally and giving these animals an opportunity to get their breath, and remove from their bodies some of the waste material. It is this steady grind that poisons the system. If the driver was required to walk he could properly regulate the time to stop and rest to a better advantage.

Then, too, the advance in land values has made it necessary to keep only such mares as can work. Too many do not see the necessity of having a little extra horse power. Then again, our barns are built without enough ventilation. Needs have changed and in order to meet these changes it is necessary that the breeder use his head.

Every breeder should strive to improve his condition. It is not wise for any individual to sit down and be satisfied with plans and methods that were employed generations ago. We must read and study and carry on experiments. Each individual should strive to acquire some substantial working knowledge each day. In fact, it is better to get thoroughly instilled in one's understanding a single working fact that means advancement, than to have a great smattering of guess work that has no working value. Special work along special lines is getting results, not only with live stock breeders, but in all lines of activity.

Now that the breeding season will soon close in many localities, let us not forget that we must continue our work, and profit by the lessons of this and other seasons, and not repeat mistakes once made. No other calling is more profitable than successful live stock breeding. It has a wonderful field and only a start has been made in its development. A great field of activity is yet before us.

We should like for every breeder to study these questions carefully, and write us for publication some particular lesson that has been learned this season. It is not necessary that we print the writer's name unless he wishes. We can sign "Subscriber," giving the name of his state. We believe it is well to impress these lessons upon the minds of our readers so that they will not forget them. Many lessons have been brought out this year. By having our readers state one or more substantial things they have learned during this season, it will be of much benefit to every one interested in live stock production.

GOOD SIRES NEED NOT GO TO WASTE.

We have already mentioned a time or two the desirability of using the summer season for advertising breeding stock that needs a change of locality. We get many inquiries for such animals, but there are hundreds of them available where we will know personally of one. Where the owner has an advertisement in the paper the cost of an advertisement can easily be saved several times over in care and feed by disposing of an animal quickly.

One breeder suggested to us recently, that owners of jennet herds might make some profitable exchanges of jacks during the summer, or might find buyers for good jacks that are too old to put on the regular market for standing, but with a year or two of good service in them and the right quality for using on jennets.

HELPING ONE ANOTHER.

Nearly every breeder has discovered something that has been valuable to him in his operations. There are some men who have more inventive ability than others, yet none of us have reached the limit of knowledge. Where we have a medium through which ideas may be exchanged practically all of these new methods can be described for the information of others and their benefit be thus greatly increased.

We have frequently requested our readers to write us little short sketches on subjects of interest to others. We are especially interested in breeders sending us communications describing some plan or method that they have found successful. Where a large number of these men assemble together one can get a great many new ideas advanced—things that are absolutely valuable to the breeding world. Yet when we ask these same men to write, they hesitate. We cannot understand why this should be the case. It is not necessary to write a lengthy article, simply explain the interesting points in as few words as possible, yet making it plain. We would like to develop this system among our readers. It has great value in a publication of this kind. We believe that if the readers would get interested in writing these short sketches, they would enjoy it, and we know that many ideas could be exchanged which would be very useful.

Now do not wait on somebody else to write, but just think of some subject and send us a short article. Do it now. The more we print of these articles the more it will encourage others to write. We have received a lot of good articles that we appreciate, and our readers have appreciated them. We have received many letters from breeders asking for these experiences, but these same men who ask for these experiences have failed to send in a communication. In order to get this necessary information each one must do his part.

STALLION GUARANTEE.

A Montana subscriber writes us that he purchased a stallion in Iowa, and that the seller guaranteed the animal to be absolutely sound. He states that on further examination after purchasing said stallion, that he finds two very prominent side bones among other blemishes. He further states that he has written the seller of this horse, telling him of the blemishes he had found, and the seller replied by saying that the horse was sound when the sale was made. The purchaser of this horse asks us to make this guarantee good.

We never have stated in this paper that we would make any guarantee good, but we have repeatedly said that we wanted full particulars concerning breeding guarantees, either as to sureness or any misrepresentatioon in the registration certificates. Concerning anything that the breeder can see for himself, he should not ask us to enter into the controversy. Blemishes such as prominent side bones should be detected by nearly every breeder. If he is not familiar with these blemishes, it is not difficult to post himself so that he could detect a case of this kind. Most of the blemishes which stallions are heir to have been explained in this paper so that any one with a little practice could detect them.

The things which the purchasing public needs help on is misrepresentation as to sureness of breeding stock and of registration certificates. These things are not easily detected by the average breeder. Anyone who has been defrauded in a transaction of this kind, will do well to write us, giving full particulars. It is our intention to carry only such advertisers as will make their breeding guarantees good. We have repeatedly refused to sell space in this paper to advertisers whom we believed were in the habit of failing to make such guarantees satisfactory.

In some cases the purchaser should not expect a stallion to fulfill the guarantee absolutely. There have been cases wherein stallions have been guaranteed to get 60 per cent of the breeding mares in foal. Owing to the condition of the stallion and the mares, this per cent has not been filled, though the percentage might have been satisfactory had all the animals been in a breeding condition. In other words, the stallion might more than fill this guarantee another year by the selection of better mares. When a stallion gets practically no colts the first year it is much more satisfactory for the purchaser to exchange and get another animal, as it is difficult to get patronage after such a failure. Some stallions have dropped the per cent of foals as low as 20 per cent the first season, and yet made good in later seasons.

We wish to say in conclusion that we will deem it a favor if our readers will write us full particulars concerning any of our advertisers who have failed to make their guarantee good. We believe that our advertisers understand that they must "tote fair" with the readers of the American Breeder. We have made this plain on numerous occasions. We hope to retain the confidence of our readers who expect to purchase other breeding stock. Purchasers will do well to mention the American Breeder when corresponding with our advertisers. There are some who would be willing to pay a reasonable price to be numbered with the advertisers in this paper. It is not our intention to print a request for any misleading "red tape"—all we want is the facts in the case. We can prove by numerous purchasers that we have kept faith with these statements.

A BALKY HORSE.

A Missouri subscriber writes that he has a three-year-old gelding that is causing him trouble. When he hitches this colt up he refuses to move. Its mother was also very balky.

There is very little use in having a balky horse. This horse should have been made a very dependable worker with proper training. He should be driven with two single lines and a bridle only. These should constitute all the harness. The lines should be of good length. Teach this colt to start and stop by using a word for each. Do not use any other words at any time for the same meaning. These words should be spoken firmly. Also teach the colt to be bridle wise.

This first lesson should be very short—half an hour or an hour each day for a week will teach the colt to start and stop at given signals, also to be bridle wise.

The next lesson is to put a breast collar on this colt and have some one take hold of the tugs. After the colt has started some weight can be put on the tugs which causes the colt to slightly pull. If he should show signs of stopping relax the weight on the tugs. If at any time the colt should refuse to move a good, long raw hide whip is the persuader. Select a particular streak across one hip and do all the whipping on this particular streak. Do not hit him anywhere else. Every time the colt is struck the particular word to be used as the signal for him to start, should be spoken.

All of these operations should be gone through with before the colt is ever hitched up. By giving a lesson of thirty minutes or an hour each day this colt can be taught to pull a very good load with a breast collar and tugs. He can be taught to start a good load. Only one man should have the management and breaking of this colt until he thoroughly understands that he is a work horse. After the colt is taught to pull the man who is holding the tugs, then a load may be hitched to these same tugs with a rope ten or twenty feet long so that the colt will not get tangled in the tugs. He should be taught to start this load and pull it a few feet; stopping him and requiring him to stand perfectly still for some little time; then start him again. Keep this up until he starts and stops at command. This load can be gradually increased until he starts a very satisfactory load. Any time he decides not to start, remember that particular streak across the hip where the whipping has been administered before. By this time that particular streak will be very much on his mind and the driver and all other individuals should keep a considerable distance from his heels because he is liable to kick, more especially after his sore streak gets real tender. Remember at each lick the given word should be spoken that is intended to start the colt.

By hitching the colt as described there is not much chance for him to break the harness or a wagon, and if he gets down he will have a very good opportunity to get up without any assistance.

After the colt has done a good service he should be petted and handled gently. If it is thought best not to administer the gad too much, when the colt fails to pull, he may be turned to the right or left to start the load. The load that is used for pulling should not be of a "scarey" nature, and nothing else should be used that might cause the colt to run away.

After the colt has been quite well broken along these lines, if he is inclined to look back, it might be well to use a blind bridle for a few times. After he has been fairly well conquered he might be hitched to a cart and driven, requiring him to turn this way and that, starting and stopping

BEFORE YOU GO TO A *Business College*

I want to talk to you either personally or by letter. I want to tell you what I will do for you. Your Son and Daughter

Will enjoy the summer in the OZARKS. Why not let them attend a practical business training school this summer and fall, where the climate is worth the money? Training for business or position. If interested investigate.
Fayetteville Commercial College, Fayetteville, Ark.

quite frequently. If he is to be used at pulling heavy loads most of his work should be done at the walk. After he is quite well mannered for light work it might be well to use him for several weeks or months at light work before he is ever hitched to heavy loads. Even after he is well broken to light work it would be well to use him single with the tugs without being hitched to a vehicle, or anything that he could break. Require him to start a reasonable load several times, remembering that that streak is still on his hip in case it is deemed necessary to use it.

During any of these operations should the colt decide to lie down and not get up, the driver may shut off his wind by holding his mouth and nose, which will cause him to struggle and regain his feet. One should be careful not to be injured while this colt is rising to his feet. If at any time this horse is loaded heavily and he makes an effort to pull all he can, be very careful not to continue straining him and get him discouraged. The load should be taken off and he should be allowed to pull the empty wagon.

These stubborn horses usually have a wonderful memory. If this colt is successful in a few of his attempts he will remember it. It requires some time to teach colts to pull. They cannot be expected to be driven off the same as an old horse the first time; it requires patience and kindness, as long as kindness can get results.

WHO HAS AN EXTRA GOOD JACK?

A good jack is about the most valuable and most profitable piece of machinery to be found on any farm. It turns out good mules, one of the most consistently saleable products of our agriculture for the past 15 years. It sires young jacks—and many a letter comes to this office reporting sales of the better young jacks at prices which will average close to $1,000. What other live stock that can be developed and sold at the moderate expense required in the case of jacks, will bring anything like this money?

In these facts is found our reason for wishing to bring out the point that many of our readers own highly valuable jacks, and to start a little friendly contest to determine who have the better ones. The announcement which we printed last week (along with a coupon for making entry) is reprinted in this issue. Any subscriber wanting to enter two jacks can use both coupons. Already we have received entries from Missouri, Kansas and Texas—and many good looking jack photos along with them. But if we do not get some that look equally good from Nebraska, Iowa and Oklahoma, we will be very much surprised—and these are not the only states having good jacks, by any means. Most jack owners are modest, but they know good animals and they are not in the habit of conceding all to some other man's jack—much less to some other state.

We really received more photos than we expected in two weeks, for it sometimes takes a little while to get this work done. Most of them are postal card size, and are very satisfactory. All but one or two are clear, and straight side views, as we requested.

Where photos cannot be gotten at once, the entries can be sent first, and the photos, marked with names of owner and jack, can follow. We want to announce next issue the closing date of the contest, and it will help us to have most of the entries in.

If extra blanks are needed let us know. We'll have a jack show (on paper) that will look like a World's Fair.

LEARN AUCTIONEERING

at World's Greatest School and become independent. The best of Instructors and Lecturers. Col. Carey M. Jones, America's leading draft horse Auctioneer, instructor in pure bred stock sales. THE HORSE BREEDING SCHOOL

The Only Term Between Now and December Will Be Held August 11 to 16

Breeders with money invested in the business cannot spend a week's time and the tuition fee to better advantage than here, and there is no better preparation for the beginner.

It's the greatest opportunity offered anywhere to make yourself an expert breeder, to learn to avoid the points of the breeding business that cause so much loss to stallion and jack owners every season. All of the instruction is practical and everything taught is demonstrated whenever possible. All instructors but two are expert post-graduate veterinarians doing educational work recognized by the United States Government.

SOME OF THE SCHOOL'S WORK, INCLUDING SUBJECTS TAUGHT.

Dissecting Mares, Anatomy and the Male and Female Organs, Physiology of the Generative Organs, Cells, Infection, Breeding Questions, Breeding Instruments, Foaling, Scientific Mating, Horse Judging, Mule Judging, Barren Mares, Barren Stallions, Abnormal Conditions, Diseases of the Foal and Fetus, Diseases of the Male and Female, Contagious Abortion, Feeding, Testing Breeding Stock, Determining a Mare's Breeding Condition, Buying Breeding Stock, Hereditary Defects, Horse Breeding, Rectal Examinations for Abnormal or Diseased Conditions; also tell whether a mare is in foal or not. Getting the Semen, Inserting Capsules, etc.

EQUIPMENT AND EXPENSES.

The school has its regularly equipped building, which is just north of Convention Hall, Kansas City, Mo. In the lecture room of this building are numerous charts, stereopticon apparatus for showing pictures and illustrations during the lectures, all kinds of breeding appliances and other equipment necessary for instruction in all the latest methods in horse breeding. A veterinary hospital is utilized in the dissecting work and the barns of dealers in mules and horses in the lectures on types, judging, etc.

Accommodations for all students will be arranged for by the school authorities without charge. They have reserved rooms and board at moderate rate—from $1.00 to $1.25 per day—sufficient to provide quarters for all who come.

Remember the date and prepare to be here next term. When you get here take Observation Park street car at Union Depot: get off at 12th street and walk one block east. **Tuition is $25, which entitles all students to a free return privilege for life.** For other information address

The GRAHAM SCIENTIFIC BREEDING SCHOOL
225 West 12th St., Kansas City, Mo.

Good Hog and Cattle Prices.

Dull Season For Horse Market Is On. Hog and Cattle Supply Not Meeting Demands and Prices Rising. Feeder Buyers Waiting for Breaks.

The dull period in the horse and mule market is on. About ever so often a rush order pops up and gives the trade the appearance of life for a time. This will be the general condition of the market for some time. A few horses and mules are available all the time, made so by an arrival of a few hundred head weekly. The only important trade of the past two weeks were sales of Southern horses and harvest mules. Steady prices prevailed on that class. Some city expressers and chunks changed hands also, but practically no heavy horses have been offered. A few medium drafters have been shipped East in express cars on rush orders. The trade from now on will be of a fill up character, and a few hundred weekly will supply that demand. Yet horsemen and traders see nothing bearish in the outlook. The year started with heavy receipts, but in the five months and a half, the supply at the five Western markets fell about 20,000 short of the same period last year, and nearly 40,000 short of the average for that time in the past five years. Prices started the year firm, and showed strength up to about four weeks ago, when the shadow of the approaching dull season caused a moderate setback. Probably at no previous time in the history of the horse market have prices been so uniform, or fluctuated less than in the first five months this year. Generally speaking demand has been in excess of the supply. The South will begin buying both horses and mules by the middle of August, and the coal districts, which have eased off in orders for the past few years, are about due to replenish their supply this fall. Last winter's experience in the feeding game, together with continued high prices for thin cattle, will make an active fall trade in thin horses. This branch of the business is being rapidly developed, and will doubtless be the saving of good thin horses and mules.

The Central West is raising much better horses now than five years ago and improved quality will draw more Eastern demand. All told, dealers expect a good active fall business.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Drafters, choice, 1600 lbs. up.	$240@285
Drafters, fair to good	160@230
Chunks, good to choice	120@155
Chunks, fair to good	85@120
Expressers and light draft	60@120
Plain workers	40@ 85
Southerns, good	125@150
Southerns, plain to fair	65@120
Plugs.	20@ 55
Mules—	
13 to 14 hands	$ 75@120
14 to 15½ hands	110@150
15½ to 16 hands	140@185
16 to 16½ hands	190@285

Sharp Advance in Cattle Prices.

In the past two weeks cattle prices have advanced 35 to 50 cents, and from the extreme low time three weeks ago have added enough to be well up to the high level of the year, and in some cases above. Monday in Chicago, steers sold up to $9.20, compared with an extreme top of $9.30. In Kansas City the top last week was $8.85, and the bulk of sales are ranging about $8 or nearly as high as in February. The causes of the upturn in the market were diminishing supplies from feed lots, the rapid advance in grain prices which tended to curtail further feeding, and prospects that good grass fat cattle would move rather late in the season. At present there are some dry spots in the pasture belt, but the general grass area is well watered clear through into New Mexico. In the Northwest ranchmen report favorable conditions. This all points to a probable heavy movement in August and September. Unfavorable weather, however, would start a heavy run before that time. At present Texas and Oklahoma are sending in a good many steers that have been fed cotton seed cake on grass. In Kansas City and St. Louis, in the past two weeks, more than 600 car loads of such cattle have been marketed. They sold at $7.25 to $8.10, and are filling in a gap that would exist if demand had to depend on grain fat cattle. The buying side of the market holds good orders daily. Shippers have been in the market, and the packers are trying to accumulate a moderate surplus of fed beef before the supply gets too small. A good many steers are being fed grain on grass for the August to October supply, but a much further advance in prices will call them to market before they show very thick flesh. A few Colorado hay fed and sugar beet pulp steers are coming. Monday they sold at $7.80 to $8.55. Commission men believe that the general market now is on a firm basis. They expect further advances in the next few weeks, though at no time do they count on much more than $9. Pasture men will have to have good strong prices if their cattle pay out, as the steers cost more than usual this spring and pasture rates have been high.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$8.60@8.85
Good to choice steers	8.25@8.55
Fair to good steers	7.75@8.20
Common to fair steers	6.00@7.70
Meal fed, choice	7.75@8.25
Meal fed, common to fair	6.85@7.70

Butcher Cattle Prices Up Also.

The advance in fat steer prices has not been as marked as butcher cattle. The prices on the latter have risen steadily within the past two weeks and are higher now than at any previous time this year. The top price on yearling steers was $8.85, heifers sold up to $8.75, and steers and heifers mixed as high as $8.80. Nine dollars is not entirely beyond that class, and some will probably reach that level within the next two weeks. Killers say they are having trouble to get enough light beeves to meet the demand, and that the season for that kind is about over. The liberal amount of feed available, and the scarcity of heavy cattle for feeding purposes made the quality of baby beeves unusually good this year. Cows are selling at $4 to $7.40, or 10 to 25 cents higher than two weeks ago. Both grass fat and fed ewes are scarce and packers say that the canning season this summer will attract the smallest supply of old cows ever seen at Western markets. Prices for veal calves and bulls continue firm. Top veals are selling at $10.50, and bulls as high as $7.50.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice.	$6.75@ 7.40
Fair to good	5.50@ 6.70
Common to fair	4.50@ 5.45
Canners.	4.00@ 4.45
Heifers—	
Choice fed	8.25@ 8.75
Good to choice	7.75@ 8.25
Plain to fair	6.75@ 7.70
Common.	5.50@ 6.70
Veal calves	6.50@10.50
Bulls.	4.50@ 7.50

Slow Feeder Movement.

The supply of stock and feeding cattle is unseasonably small and will continue so for some time to come. Prices have not changed much but the season is so far along that a good many have cancelled orders and will wait until fall. However, there are buyers watching all the time for weakness in the market, and a period of general drouth seems to be the only thing that will put thin cattle on the bargain counter. Such a condition is not even anticipated at the present. The continued movement of breeding stock that have been going back to the country in the past twelve months should increase the supply some by next year. Stock steers sold at $6.75 to $8 and feeders $7 to $8.10. Stock heifers are quoted at $5.50 to $7.25, and stock cows $4.50 to $6.50.

The following quotations are for stock and feeding cattle.

Selected feeders	$7.75@ 8.10
Good to choice feeders	7.50@ 7.70
Plain to fair feeders	7.00@ 7.50
Selected stockers	7.50@ 8.10
Good to choice stockers	7.00@ 7.50
Plain to fair stockers	6.50@ 6.95
Stock calves	6.25@ 8.25
Stock cows	4.50@ 6.50
Stock heifers	5.50@ 7.25
Milch cows	35.00@90.00

Improved Prices For Hogs.

Liberal supplies of hogs have arrived at the five Western markets within the past two weeks, and demand has been active. Many prices closed at highest level of the month

WITTE Engines
1½ to 40 H.P.

Cost Less!—Worth More!

Here's my new offer, **direct** from my factory to power users everywhere. **No dealer's profits.** Think of it! The **highest** standard engines for the **lowest** prices. Nobody else has these two things to offer together.

DEPENDABLE POWER
From Gasoline, Gas or Oil

WITTE engines have set the quality standard for 26 years. Better today than ever. 1½ to 40 H. P. stationary and portable sizes. All have detachable cylinders, vertical valves, four ring pistons, electric ignition and other exclusive merits, without which no engine can now be high-grade.

Start Without Cranking

The **WITTE** had that advantage 20 years ago. You don't even have to press a button. Don't be satisfied with any out-of-date engine. Don't risk any untried, new fangled devices with high-falutin' names. Be safe and sure. Let me show you

How To Judge Engines

My new book shows the secrets. All made plain as A. B. C. It gives my 5-year guarantee and 60-day free trial plan. Tells you how to be safe in your engine selection, even if you don't pick a **WITTE.** It took me 26 years to write it, but you can get it quick—just send me your name—no money—and it will come by return mail.

ED. H. WITTE, WITTE IRON WORKS CO. 2555 OAKLAND AVE., KANSAS CITY, MISSOURI.

FREE BARGAIN BULLETIN
A NEW ONE EVERY MONTH

Before you build get our prices. Smashing reductions in **LUMBER;** 3,000,000 feet—new and used. Every grade and dimension. Write today and we will send you free regular monthly list showing everything—doors, windows, roofing, paint, hardware, etc. 500 items.

RED OAK, IOWA

GOOD SHORTHORNS.

Practical cattle for both beef and milk. Just the kind the farms of the country need, and with breeding and conformation to make show cattle if you want them. I show my breeding stock successfully, but no stock is ever crowded enough to hurt it.

Pleased to show stock, quote prices and answer inquiries at all times.

C. H. White, Burlington, Kas.

CATTLEMEN.

British Columbia bunch grass range land. We can locate you on Government land, 21 year lease with option to purchase. Have several ranges with cattle for sale. **The Wright Investment Co., Ltd., 1110 Dominion Bldg., Vancouver, B. C.**

and in the first four days of the following week fell back 25 to 30 cents, but on Friday started up again and that week a full recovery of the loss occurred. Monday the market weakened again. Packers' droves of hogs have cost them more in the past two weeks than at any time in May. Packers seem to need hogs. Demand is on a fresh pork basis and while hogs are coming strong in weight they are not above the requirements of the trade. Thus far this month there has been a general absence of old sows. The reason is that farmers are holding their breeding stock, and the winter packing season will bring out a large supply of aged hogs. The high temperatures of the past few days have caused a big loss among hogs in transit, due to faulty loading and heavy fill before the hogs were started. The general health of hogs in the country is said to be good, and practically no young pigs are coming to market. A year ago several thousand were received weekly in Kansas City and Chicago.

The following table shows prices for hogs in Kansas City in the past two weeks:

		Preceding Week.
Mon., June 9...	$8.35@8.50	$8.45@8.70
Tuesday.	8.40@8.65	8.30@8.57½
Wednesday. . ..	8.50@8.75	8.25@8.50
Thursday.	8.65@8.80	8.20@8.45
Friday.	8.60@8.80	8.30@8.55
Saturday.	8.60@8.80	8.30@8.47½
Mon., June 16..	8.50@8.80	.....

The following quotations are for hogs:

Choice, 250@300 lbs	$8.60@8.72½
Choice, 200@245 lbs	8.70@8.75
Medium weight	8.70@8.80
Light weight	8.25@8.80
Common to fair	7.60@8.55
Stags.	7.00@8.50
Boars.	4.25@6.50
Bulk of Sales	8.60@8.75

NEVIUS AND KANSAS COLLEGE SELL SHORTHORNS.

C. S. Nevius' annual sale of Shorthorn cattle on June 6 included a consignment from the Kansas Agricultural College, adding interest to the event. The attendance was good and demand brisk, but many bidders apparently had not figured on the fact that breeding cattle are at least 50 per cent higher than a year ago, and comparatively few got their ideas readjusted in time to buy. Prices were really moderate, as such cattle are now selling, ranging from $100 up to $580 and averaging about $215. The college cattle (all females and mostly with choice calves at foot) were good values at an average of nearly $214. Mr. Nevius' Searchlight bulls were in brisk demand, as the prices show. Practically all the buyers have known the herd for years and knew just what they were getting. The sale was held on Mr. Nevius' farm near Chiles, Kas., as usual, and Col. R. L. Harriman, who has sold probably $75,000 worth of breeding stock for Mr. Nevius in the last half dozen years, conducted the sale. Following is a complete list of the transactions:

SUMMARY.

10 bulls. . ..	$2,605; average....	$260.50
35 females.. .	7,105; average....	203.00
45 head. . ..	9,710; average....	215.78

Walnut Boy, the famous pacing stallion, belonging to John Callison of Windsor, Mo., died recently at the age of 27 years. Walnut Boy had an exhibition record of 2:11½, made at the Chicago world's fair 20 years ago, and was a successful sire of racers.

Coming Features

By R. E. Olds, Designer

From this time on, when you buy a car, these are things to watch for.

Left-side drive—
Center control—
Oversize tires—
Set-in dash lights—
Free entrance in front—

Right-side drive has been abandoned by the leading cars. Hereafter drivers will sit close to the cars they pass.

Skimpy tires are out-of-date. So are projecting side lamps. So is a blocked front door. These features are absent in the best cars now. They'll be absent in all cars soon.

Reo Rod Control

Note that Reo the Fifth has all these new features. And our center control is a one-rod control—an exclusive Reo feature.

All the gear-shifting is done by moving this rod three inches in each of four directions. It's as simple as moving the spark lever.

There are no levers, side or center. Both brakes are operated by foot pedals. So the driver's entrance on either side is clear. He need never dismount in the street.

When you see these features you'll not want a car without them.

Other Advances

Then the Reo marks the latest practice in some other great respects:

Analyzed steel—
Vast overcapacity—
15 roller bearings—
190 drop forgings—
A $75 magneto—
Doubly-heated carburetor—

Roller bearings cost five times what common bearings cost, but they do not break. Drop forgings cost twice as much as steel castings, but they don't have flaws.

In Reo the Fifth, steel is all made to formula. The gears are tested in a 50-ton crushing machine. The springs are tested for 100,000 vibrations.

Each driving part, for big margin of safety, is tested for 45 horsepower requirements. Each engine is given five long tests—48 hours altogether.

Parts are ground over and over. Important parts are hand-fitted. Nothing is left untested.

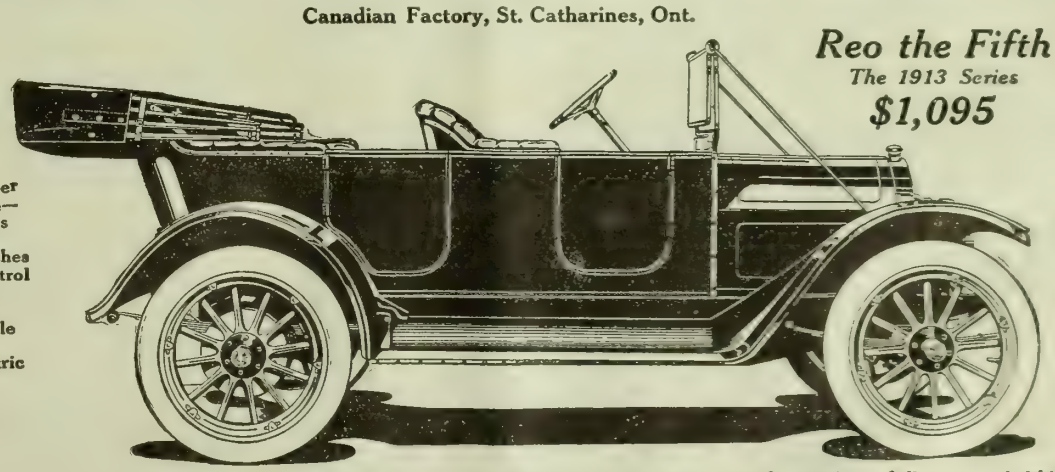
What They Cost

These things are costly. Oversize tires cost us $60 extra. Our unusual features, all combined, add $200 per car to our cost.

But we save this for you by building only one model. That saves about 20 per cent.

And these things are essential in a car that endures. A car without them may run well for a while, but the second season repairs and troubles come.

Reo the Fifth marks the best I know after 26 years of car building. I would not buy a lesser car myself, so I shall never build one.



In the years to come you'll save hundreds of dollars by having a car built like this.

Sold by 1,000 dealers. Showrooms almost everywhere. Catalog on request.

R. M. Owen & Co., General Sales Agents for Reo Motor Car Co., Lansing, Mich.

Canadian Factory, St. Catharines, Ont.

Reo the Fifth
The 1913 Series
$1,095

30-35 Horsepower
Wheel Base—112 Inches
Tires—34 x 4 Inches
Center Control
15 Roller Bearings
Demountable Rims
Three Electric Lights
190 Drop Forgings
Speed—45 Miles per Hour
Made with 5 and 2 Passenger Bodies

Top and windshield not included in price. We equip this car with mohair top, side curtains and slip cover, windshield, Prest-O-Lite gas tank for headlights, speedometer, self-starter, extra rim and brackets—all for $100 extra (list price $170). (Gray & Davis Electric Lighting and Starting System at an extra price, if wanted.) (203)

American Hen Now Leads.

English White Leghorns Still Hold Pen Record, But a Buff Wyandotte Pullet Lays Every Day for 62 Consecutive Days.

To the American Breeder:—In the National egg laying contest at Mountain Grove, Mo., a Buff Wyandotte hen from Wermont now leads all other hens, with 167 eggs to her credit for the six months and a half, or a total of 197 days. An English S. C. White Leghorn hen has held first place from the beginning of the contest. This English pen holds the pen record with a total of 1,338 eggs for this period. This pen has also laid about one hundred soft shelled and unmarketable eggs, which, if they could have been credited, would have put them far in the lead. The total eggs laid in May was 12,455, and this runs the grand total to 59,975. May was the hottest month experienced at this place for more than ten years. We lost two hens as a result of the heat and this hot, dry weather is affecting our egg records considerably.

A pen of S. C. Brown Leghorns from Fulton, Mo., and a pen of Barred Plymouth Rocks from Sioux City, Ia., tied for the silver cup for May, each pen laying 239 eggs. Two Buff Wyandotte pullets, No. 860 from Vermont, and No. 600 from Missouri, each laid 31 eggs in the 31 days. The last mentioned pullet has laid 62 eggs for 62 consecutive days. She will have to lay 20 more eggs to equal Lady Showyou's record of last year.

The pens (ten hens each) which have thus far laid more than 1,000 eggs are as follows:

Pen No.	Breed.	Eggs
2	S. C. White Leghorns, England.	1,338
19	Silver Wyandottes, Iowa	1,108
23	Silver Wyandottes, Illinois	1,105
57	Black Langshans, Missouri	1,095
20	White Wyandottes, Arkansas.	1,044
49	Black Langshans, Missouri.	1,043
33	Barred Plymouth Rocks, Ill.	1,041
30	Buff Wyandottes, Vermont.	1,038
56	White Orkingtons, Kentucky.	1,018
9	S. C. Brown Leghorns, Mo.	1,013
26	Buff Wyandottes, Missouri.	1,007

It will be seen from the following that every pen of Black Minorcas made a great record for May. The pens laying over 220 eggs each for the month were as follows:

Pen No.	Breed.	Eggs
9	S. C. Brown Leghorns (Mo.)	239
39	Barred Plymouth Rocks (Ia.)	239
11	Black Minorcas (Ia.)	235
17	Black Minorcas (N. Y.)	235
26	Buff Wyandottes (Mo.)	235
8	S. C. White Leghorns (Cal.)	225
5	Black Minorcas (Mo.)	225
10	R. C. White Leghorns (Mo.)	222
2	S. C. White Leghorns (Eng.)	221
32	White Plymouth Rocks (Mo.)	221
40	Rose Comb Reds (Mo.)	220

Two pens tied for first place, three tied for second place, and two tied for third place for the month.

The highest individual record for the first seven months last year was 156 eggs. For fifteen days less time this year, three hens have already exceeded that record. Lady Showyou had laid 150 eggs by the last day of May last year. The highest records thus far this year, each for 6½ months, are as follows:

Hen No.		Eggs.
860	Buff Wyandotte (Vt.)	167
66	S. C. White Leghorn (Eng.)	166
600	Buff Wyandotte (Mo.)	164
735	Black Langshan (Mo.)	154
62	S. C. White Leghorn (Eng.)	154
65	S. C. White Leghorn (Eng.)	153
61	S. C. White Leghorn (Eng.)	150
871	White Wyandotte (N. J.)	148
55	R. C. White Leghorn (Mo.)	145
67	S. C. White Leghorn (Eng.)	144
357	Buff Wyandotte (Vt.)	144

EGG LAYING CONTEST IN LECTURE.

Those who attend the meeting of the State Poultry Federation in Manhattan, June 26 and 27, will have an opportunity to learn all about the National Egg-Laying Contest. A lecture on this contest, illustrated by lantern slides will be given by T. E. Quisenberry, director of the State Poultry Experiment Station of Missouri. It will be shown how the winners of the contest were fed and the differences in type between high-producers and low-producers. Mr. Quisenberry also will be prepared to answer and discuss any questions relating to the subject.

TRUMANS BUY $625 GELDING.

Holland-Nugents-Maxwell Brothers Commission Co., National Stock Yards, Ill., according to the Live Stock Reporter, recently sold the highest priced three-year-old draft colt ever sold at the National Stock Yards. This colt was purchased by Pillsbury & Co. at Paris, Ill., and consigned to the above firm, which sold him to J. G. Truman of Bushnell, Ill. He weighed 2,140 pounds. He was sired by the imported Shire stallion Milestone Harold (23495), imported by Truman's Pioneer Stud Farm, Bushnell, Ill., and sold to Sunkel & Co., Redmon, Ill. This gelding will be shown at the leading state fairs and horse shows the coming fall. The price was $625. Seventeen head of draft horses consigned by Halstead Bros., Tecumseh, Neb., sold for $5,012.50.

THIRD SUCCESSFUL YEAR WITH CAPSULES.

To the American Breeder:—I do not know how anyone could stand a stallion or jack without a Carlson breeding outfit. I am using mine every day with perfect success. Have not failed once this season to get the semen. Have cut down my stallions from five to two and am breeding as many mares now as when I had five stallions. Farmers, generally, are satisfied with the capsule system and are growing more and more in favor of scientific breeding, as they become better acquainted with this method. One thing in favor of capsule breeding is that farmers come with their mares at a stated time, knowing that they can get service from any horse or jack in the barn, regardless of how many there are to be bred. The capsule system is the surest way to settle a mare. I have men here every day asking me to use capsules on their mares, as it has proven surer than natural service. I say, by all means use the capsule system; save your horse or jack and get better results and more foals. I have had three years' experience and that is my verdict.—J. S. Smith, Custer County, Neb.

SUCCESS IF YOU FOLLOW AMERICAN BREEDER INSTRUCTIONS.

To the American Breeder:—I know anyone that will follow the instructions of the American Breeder in capsule breeding will have success with it. The season was nearly over when I got my outfit last year, and being a new thing to me, I only bred a few of our own mares. We had a mare that we had bred for two years to both horse and jack, and could not settle. I capsuled her and settled her at once. I had a customer that I thought would be the last man on earth to be convinced that artificial breeding was O. K., but last week he brought four mares and called for the capsules. Wishing your splendid paper success, I am.—H. A. Brown, Craig County, Okla.

THOROUGHBRED SELLS FOR $150.000.

Craganour, the English Thoroughbred that finished first in the Derby at Epsom Downs, near London, has been sold for $150,000. The purchase was made soon after the race, by agents for the government of Argentina, South America. The Derby prize did not go to Craganour, the judges having disqualified the stallion for bumping into other entrants during the race, but evidently the Argentine buyers were satisfied as to his running ability.

Government Regulation of Live Stock Serums.

Congress has passed a law requiring the manufacturers, dealers and importers of serums to comply with certain government regulations. This is a move in the right direction. Too many grafters and ignorant concerns have been connected with the serum treatments. This is one of the reasons that more progress has not been made in this direction. Vaccines and similar agencies, should rightfully have a leading part in the best progress in animal husbandry today, and it is hoped that the Bureau of Animal Industry will carefully scrutinize every product which possibly might bring discredit to them.

Reliable treatments should be protected. Every honest, intelligent manufacturer who actually makes a product that is beneficial, should be encouraged. Great progress has been made along these lines, yet it is only in its infancy. With proper encouragement, and the right kind of publicity, the serum treatments are sure to assume great proportions. Investigators have a wonderful opportunity owing to the available material upon which to work. Domestic animals of a cheap class can be used for this purpose.

Those interested can get full information in B. A. I. Order 196, by writing to the Bureau of Animal Industry, Washington, D. C.

We give below an extract from the law approved March 4, 1913:

That from and after July first, nineteen hundred and thirteen, it shall be unlawful for any person, firm, or corporation to prepare, sell, barter, or exchange in the District of Columbia, or in the Territories, or in any place under the jurisdiction of the United States, or to ship or deliver for shipment from one state or territory or the District of Columbia to any other state or territory or the District of Columbia, any worthless, contaminated, dangerous, or harmful virus, serum, toxin, or analogous product intended for use in the treatment of domestic animals, and no person, firm, or corporation shall prepare, sell, barter, exchange, or ship, as aforesaid any virus, serum, toxin, or analogous product manufactured within the United States and intended for use in the treatment of domestic animals, unless and until the said virus, serum, toxin, or analogous product shall have been prepared, under and in compliance with regulations prescribed by the Secretary of Agriculture, at an establishment holding an unsuspended and unrevoked license issued by the Secretary of Agriculture as hereinafter authorized. That the importation into the United States, without a permit from the Secretary of Agriculture, of any virus, serum, toxin, or analogous product for use in the treatment of domestic animals, and the importation of any worthless, contaminated, dangerous, or harmful virus, serum, toxin, or analogous product for use in the treatment of domestic animals, are hereby prohibited. The Secretary of Agriculture is hereby authorized to cause the Bureau of Animal Industry to examine and inspect all viruses, serums, toxins, and analogous products, for use in the treatment of domestic animals, which are being imported or offered for importation into the United States, to determine whether such viruses, serums, toxins, and analogous products are worthless, contaminated, dangerous, or harmful, and if it shall appear that any such virus, toxin, or analogous product, for use in the treatment of domestic animals, is worthless contaminated, dangerous, or harmful, the same shall be denied entry and shall be destroyed or returned at the expense of the owner or importer. That the Secretary of Agriculture be, and hereby is, authorized to make and promulgate from time to time such rules and regulations as may be necessary to prevent the preparation, sale, barter, exchange, or shipment as aforesaid of any worthless, contaminated, dangerous, or harmful virus, serum, toxin, or analogous product for use in the treatment of domestic animals, and to issue, suspend, and revoke licenses for the maintenance of establishments for the preparation of viruses, serums, toxins, and analogous products, for use in the treatment of domestic animals, intended for sale, barter, exchange, or shipment as aforesaid. The Secretary of Agriculture is hereby authorized to issue permits for the importation into the United States of viruses, serums, toxins, and analogous products, for use in the treatment of domestic animals, which are not worthless, contaminated, dangerous, or harmful, All licenses issued under authority of this act to establishments where such viruses, serums, toxins, or analogous products are prepared for sale, barter, exchange, or shipment as aforesaid, shall be issued on condition that the licensee shall permit the inspection of such establishments and of such products and their preparation; and the Secretary of Agriculture may suspend or revoke any permit or license issued under authority of this act, after opportunity for hearing has been granted the licensee or importer, when the Secretary of Agriculture is satisfied that such license or permit is being used to facilitate or effect the preparation, sale, barter, exchange, or shipment as aforesaid, or the importation into the United States of any worthless, contaminated, dangerous, or harmful virus, serum, toxin, or analogous product for use in the treatment of domestic animals. That any officer, agent, or employee of the Department of Agriculture duly authorized by the Secretary of Agriculture for the purpose may, at any hour during the daytime or nighttime, enter and inspect any establishment licensed under this act where any virus, serum, toxin, or analogous product for use in the treatment of domestic animals is prepared for sale, barter, exchange, or shipment as aforesaid. That any person, firm, or corporation who shall violate any of the provisions of this act shall be deemed guilty of a misdemeanor, and shall, upon conviction, be punished by a fine of not exceeding $1,000 or by imprisonment not exceeding one year, or by both such fine and imprisonment, in the discretion of the court.

MANY CAPSULE COLTS FIRST YEAR.

To the American Breeder:—I have been a subscriber to your paper for quite a while and always find valuable information in it. I keep three stallions and used one of the Carlson semen extractors last season and got along real well with it. Will have quite a good many capsule colts and some of my friends are anxious to see one of those new fangled colts, as they call them, but I told them, they would not see any different kind of a colt, as it just took so much semen to make a colt and all there was to it, was it had to be done clean and quick, and if the mare was right she got in foal.—James T. Leininger, Highland County, Ohio.

HER TWENTY-SECOND COLT.

To the American Breeder:—I have been very much interested in the records of good brood mares you have been publishing from time to time, and not seeing anything to equal the record of Old Belle, I thought probably she might put some of your horse breeders to thinking and realizing that "down in the land of cotton" we have some good horses. My neighbor, A. T. Richardson, away back in the

OLD BELLE AND HER 22D COLT.

eighties, owned a little black thoroughbred mare named Fannie, from which he had raised quite a number of good horses and mules. In the spring of 1887 this little mare gave birth to a beautiful brown mare colt, the sire of which was Cameron's Leal —a grade standard bred. The colt fattened and grew and at the age of three was bred, and at four gave birth to her first colt. Not a spring has rolled around since that time but that she (Belle) has done the same thing, and the past week, at the age of 25 years, gave birth to her twenty-first

PARTNER WANTED.
I am a competent veterinarian and experienced live stock farmer, and offer my time and services in the management of a stock farm, horses, mules, cattle, sheep or hogs, depending on locality. Make me a proposition. I own a full blooded Morgan and two of the best draft stallions in my county. **W. B. Black, V.S., Osakis, Douglas County, Minn.**

$600 BUYS

The Rex Denmark—Black Squirrel bred saddle stallion, REX KNOX 3115. Black; 15.2; five years; sound. A great acting show horse and sire. Fearless under saddle and in harness.

Also the ladies' beautiful saddle mare, MANCELONA II. Bay; 15.1; four years; sound; eligible to registration; safety city broken to saddle and harness and suckling fine foal by Rex Knox. Destruction of my barns by fire makes this sacrifice imperative. **W. T. Wilkinson, Eureka, St. Louis County, Missouri.**

REGISTERED MORGAN HORSES.
My Morgans ars large; 15 to 16 hands and 1050 to 1300 pounds; have clean, heavy bone and possess all of the style and endurance for which the breed is noted.
For Sale—Weanlings to 3-year-olds, by The Admiral 4871 A. M. R., he by Jubilee De Jarnett. Send for catalog. **Richard Sellman, Rochelle, McCulloch County, Texas.**

EXCELSIOR SHETLAND PONY FARM.
Registered stock a specialty; a limited number for sale. W. H. Fulcomer, Prop., Belleville, Republic Co., Kas.

WANTED—SADDLE HORSE.
I have a customer for a good saddler. Must be gentle, sound, a good looker, of easy gait to carry rider of 190 pounds. Address **John Dalton, 235 South 26th St., Lincoln, Neb.**

colt, which is as lively and sprightly as a colt from a four-year-old. The first colt lived only a few days, but all the rest were raised, and if she raises the present foal, it will be twenty out of twenty-one. Who can beat it? Old Belle is now hale and hearty and bids fair to give birth to several more colts. She has done a good share of farm work all these years until the past two. Her colts have been about equally divided between mules and horses, and of the whole not a single sorry one.

If any of your readers have anything to beat this, let us hear from them, or if there are any "doubting Thomases" among them, tell them to speak out. We have the goods and can deliver.—Philip Willingham, Sumter County, Alabama.

Editor's Note:—The above letter was received at this office over a year ago. We held it and asked Mr. Willingham to get us a photograph of the mare if he could. Not long ago we received a second letter from Mr. Willingham and a little later the above photo, showing not the twenty-first colt, but the twenty-second. In connection with the photo, Mr. Willingham wrote:

"You remember that last year I wrote you a little history of Old Belle. She has just given birth to her twenty-second colt and is 27 years old. I am inclosing a kodak picture showing her with her latest born."

FIELD NOTES

Read the advertisement of C. H. White, Burlington, Kas. It is of interest to any one needing good Shorthorn cattle, and a lot of people do.

For a hay press proposition that you cannot go wrong on, read the advertisement of the Auto-Fedan Hay Press Company, 1545 West 12th St., Kansas City, Mo.

It is generally known among those familiar with gasoline engines that the Witte engines are exceptionally good values. They excel in simplicity, durability and power. Read the advertisement of Ed H. Witte, Pres. of the Witte Iron Works Company, 2555 Oakland Ave., Kansas City, Mo.

The ponies are with us again. The interesting plan by which many a child has secured a pony for its own use is advertised again on our back cover by the national women's paper, known as the Farmer's Wife. In answering this advertisement be sure to use the coupon on the bottom

QUESTIONS AND ANSWERS

(Continued from page 5.)

opening at the navel has not properly closed and when it remains open long there is great danger of infection entering and extending to the vital parts of the colt and destroying its life. To avoid this one should keep the parts wet with some good antisptic for a few days. For this purpose one can place over the part a piece of medicated cotton, which has been dipped in a one to one thousand bichloride of mercury solution, and keep it in place with a broad bandage around the body. Renew the pack daily.

RUPTURED COLT—I have a colt two months old that is ruptured in one side; one testicle hangs down and sometimes it is about the size of a man's fist, and at other times it is not down at all. Please advise me what is best to do for a case of this kind. It is a fine Morgan colt and I would like very much to save it.—Virginia Subscriber.

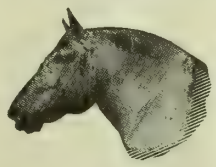
REPLY—The proper thing to do in this case is to have the colt castrated by a skilled surgeon, using the covered operation. Nothing else will cure a case of this kind.

COLIC—I would like to know what is the matter with my mare and what to do for her. She is eight years old and weighs about 1,400 pounds. She was due to foal the first of April. In the winter she would have sick spells after eating or drinking, and act like she had the colic. I gave her colic medicine and she would get well in a few minutes. She brought a nice colt about the 15th of April. Since then if she gets a little grass or eats or drinks heartily she will get very sick. Once I called a veterinarian and he said it was her liver and spleen, but she acts like she had the colic. What can I do for her so I can turn her out to grass?—Kansas Subscriber.

REPLY—It is difficult to determine just why this mare should have repeated attacks of colicky pains and it will necessitate the services of a skilled veterinarian who should be given the opportunity to carefully study the case. Colic is induced by such a great variety of causes that it would be folly on our part to hazard a guess as to why this mare has a repetition of these spells. An examination should include the digestive organs, the bladder, kidneys, ureters, uterus and liver. Until you can have such an examination made you should study carefully what food best agrees with her and avoid all that brings on these attacks.

DIFFICULT PARTURITION—I had a fine half Percheron mare six years old that had raised two fine mule colts; one will be two years old this spring, the other one year old. The one last year got the premium at the colt show, also at the county fair. I bred her last year to a fine Percheron horse. Her time to foal a colt was May 19. Her udder began to grow about seven weeks before time for her to foal. I had bred her about three weeks before to a jack, and I did not breed but once to horse, so thought I would get a mule colt again. On May 12th her milk was white; that night I watched her pretty closely. About 4:30 a. m. she commenced to try to foal. The colt sack protruded about six or eight inches, but that was all that I saw. At about half past six a. m. I tried to get the veterinarian, but he was sick, so I tried for another about ten miles away, but could not get him before two o'clock p. m. By then the mare was some better. The veterinarian examined her and said that the uterus had not dilated any and the colt's feet were in the right position. He said he thought that she had the colic, but I told him I thought not, for she acted just like a mare in labor and she had milk in her udder for about 24 hours before she got sick. He did not do anything for her, but told me to call him again the next morning if she was no better. She got worse that evening about four o'clock and was bad all night, so I called the veterinarian again, but could not get him until in the afternoon. By then the discharge from her was terribly offensive. The veterinarian examined her and said her uterus had dilated some, but the colt had not started any, so while he was trying to take the colt from her she died. The colt's hind feet were turned first. The veterinarian said he never saw a case like it before. He is the state's assistant veterinarian. The mare had been running on pasture of grass and clover and was kept in a large shed at night and fed timothy hay and about four ears of corn. She was just in good living order as I try not to have my mares too fat at foaling time. I have never seen a case like this in your paper and would be glad of any information on the subject. The colt was alive about four or five hours after she first began to labor, but never saw it move after that.—Missouri Subscriber.

REPLY—Either you or your veterinarian were mistaken in the conditions present in this case. One thing is certain if the enevelopes were protruding as you suggest, the cervix was dilated so that was the proper time to aid in her delivery. A colt does not live long unless delivered after labor pains begin. To save the life of the colt generally calls for prompt action on the part of the veterinarian. The offensive odor mentioned was perhaps due to the putrefactive changes of the dead foetus and envelopes. Such putrefaction poisons the mother through absorption through the walls of the uterus and death necessarily will take place as a result.



ABORTION IN COWS—Is there any remedy for abortion in cows? If so, what is it?—North Dakota Subscriber.

REPLY—Abortion in cows is not materially different from abortion in mares. The chief thing to keep in mind is that usually it is an infectious or contageous disease. It is a disease that may be conveyed to healthy cows through an infected bull, so it is just as important in contending with this disorder to properly disinfect the bull as well as affected cows. Whenever a cow shows signs of aborting, she should be promptly separated from the herd and kept segregated until she is sound. This is very necessary and makes the problem of controlling abortion a difficult one. When abortion developes in one's herd, the owner

A CROP EVERY YEAR

A country that will do that, is worth tying to. Plenty of rainfall would make millions of acres in some portions of the country very productive. But where it cannot be depended on, farming is hazardous. The entire line of the KANSAS CITY SOUTHERN RY. runs thorugh the certain rainbelt and if the farmer does his duty, he is sure of a crop. Quit gambling on the climate. Make your home in this region of perpetual crops. The richest virgin soil is waiting for you here at prices you will never again be able to touch. Send today for information about land open for settlement and let the Kansas City Southern start you on the way to fortune. Don't delay visiting the country that will mean better conditions and steady profits for you. Remember—a crop every year!

WM. NICHOLSON,
671 Thayer Bldg., Kansas City, Mo.
Immigration Agent, The Kansas City Southern Railway.

Irrigated Farm Land

With Abundant Water Supply.

Grazing Land (Watered) and Timber for sale in Southwest Colorado. Irrigation facilities here are unexcelled and this has long been Colorado's best live stock section.

Fine, moderate climate; no extremes; tornadoes unknown.

155 acres fine private water right. 2½ miles from Mancos; 30 acres in meadow, timothy and red top. Alfalfa, meadow, grain land, small orchard. Good six room house just been remodeled. Hay barn 40x56. Horse barn, cow sheds, chicken house, shop, granary, ice house, etc. Good fence; $55 per acre; a bargain.

160 acres; good house; barn, cross fences; chicken house; sheds, etc.; four shares in storage system besides fishing in waste water. Four acres in cultivation. New farm; fine land; four acres in orchard; $5,000.

160 acres four miles from town; good small house; barn; fenced; partly under cultivation; fine land; $2,000.

Raw land, agricultural and grazing at $5.00 per acre.

W. L. Morse, Mancos, Colorado.

sale or trade for pure bred horses; herons; mares preferred. Price per acre. F. D. Maddex, Arcadia,

s the personal aid of a qualified inarian who is thoroughly con- nt with the nature of the dis- so that advice suited to the par- r case may be given and effec- lans carried out for the eradi- of the ailment.

LLEN JAW—I have a three year ld filly whose jaw all swelled swelled from her throat to her nd has been swollen for five weeks. I took her to a veteri- and he said he did not know what to say about it. What do you think is the trouble with her?—Kansas Subscriber.

REPLY—There are several things that would cause a swelling such as you describe, but your veterinarian should search carefully for a diseased molar tooth or possibly an injury to the bones to which the base of the tongue is attached. Again, it may be that some of the deep salivary glands are involved, or possibly the lymphatics of the region. The character of the swelling should be studied, the temperature and condition of circulation ascertained, etc., before a correct diagnosis can be reached. It would be impracticable for us to undertake to prescribe for your mare without having an opportunity to make an examination. Your veterinarian should be able to come to some conclusion if he is a qualified man.

OBSTRUCTION IN VAGINA—I had a mare brought to my place about 12 years old; has raised four or five colts. She aborted about 18 months ago. She looks well. On examination I found something like the uterus within four inches of the surface. Could not push it back, but could pass above it and back 12 or 14 inches. I gave her a capsule in what appeared to be the uterus. Did I do right?—Colorado Subscriber.

REPLY—The obstacle encountered was either a tumor growing in the vaginal wall or a fold of the vaginal wall that had resulted from a partial prolapsus. The thing to be considered is whether or not the obstruction will mechanically interfere at foaling time in the event the mare conceives.

IRRITABLE BLADDER—Will you please tell me what is wrong with my gelding, he stops frequently to pass water, but only passes a small amount at a time. I see nothing wrong with the urine except that it is a little oily and stringy at the last. He seems to suffer no pain. I feed him corn three times a day, oats twice, and bright timothy hay, and work him in the field. He is four years old. His is not the only case of this kind I have ever known.—Illinois Subscriber.

REPLY—Be sure that all feed is sound and free from dust or mould. Give him an ounce of elixir of raw palmetto and sandal wood compound three times a day. It may be thrown into the mouth with a syringe. Do not get this animal too warm while working. Give him access to grass, if possible. If the trouble does not subside in ten days or two weeks, have a veterinarian make a manual examination of the bladder for a calculus.

PILES—I have a one year old mule colt that has something like the piles. What can I do for it?—Tennessee Subscriber.

REPLY—It is quite likely that your mule colt is in a condition that necessitates a surgical operation, and we would suggest that you call in a qualified veterinarian who can give the case a careful personal examination, and operate if it is found advisable.

BULL FAILS TO SERVE—I have a two year old Aberdeen-Angus bull and in the last week he has failed to do service. Is just as keen as ever; will mount a cow, and dismount without doing anything. He will not run his penis out and acts like he is sore. Tell me what is the matter and what to do for him.—Kansas Subscriber.

REPLY—Have this bull examined by a qualified veterinarian. It may be that there is a constriction at the entrance of the sheath that prevents extruding the penis.

INJURED TESTICLES—I have a horse that has strained himself in his testicles; they drop down some and are swollen some. He is a rank server; he gets off too quick. Please give me your remedy and also how to handle a horse like this. Will it interfere with his breeding?—Missouri Subscriber.

REPLY—We suspect this horse is affected with a slow going chronic form of orchitis and you should discontinue him from service if the testicles contiue swollen. It would be of help to keep a suspensory on him at least a part of the time. A good antiphlogestine pack held in place with a suspensory would be of aid in reducing the inflammation.

INJURED PENIS—I want to ask you what to do for my fine jack. He was kicked on the penis some three weeks ago. There is no perceptible swelling and he is ready to serve the same as ever, but when he does serve quite a lot of blood comes from his penis. I have stopped using him. Please advise me what is best to do.—Texas Subscriber.

REPLY—There is only one thing to do and that is to discontinue the jack from service until the hemorrhage ceases. The difficulty is that erections cause bleeding and you should, during the period of rest, discourage these by using a shield or ring.

ANNOYANCE FROM FLIES—I would like to ask you if you know of some remedy or solution to put on a horse to keep off the flies. There are several solutions to be had here, but the trouble I find with them is that they all leave the hair in very bad shape, making it gummy so that it catches all of the dust and dirt that comes along.—Iowa Subscriber.

REPLY—We know of nothing that is perfectly satisfactory in preventing annoyance to horses or other animals from flies. Several preparations are on the market, but on account of containing gummy oils are objectionable. The most of them do not keep the pests away long. In addition to the use of such preparations one can do much to relieve horses of the annoyance by keeping the premises scrupulously cleaned of all filth. Filth is the breeding place for flies. The manure and refuse should be daily carted to the fields. By using screens on the doors and windows and making use of flytraps and poison placed out of the reach of the animals, one can do much in ridding the premises of these annoying pests.

ABORTION—As we have been having contagious abortion among mares in this locality, would like to know how long it is necessary to wait before breeding to a horse so the horse would not transmit the disease to other mares? Also if a horse is bred to an unclean mare, of the above type, how long will it take him to get clear if he is not treated for the same disease, if he is kept in use all the season? The reason I ask this question is that one might breed a diseased mare unknowingly.—South Dakota Subscriber.

REPLY—Do not breed such a mare to the stallion at all. Use the capsule system, which removes all danger of contaminating the stallion. Do not depend on an infected stallion getting rid of the disease himself. Disinfect the genitals once a day for several days if you have reason to think he has served an unclean mare. You have a perfect right to know the condition of every mare you permit your stallion to serve, and an honest owner will help you in gaining such knowledge. You are both interested in knowing the truth of the matter, and not to know the truth means loss and aggravation to both parties.

BLACK HAW—I saw in your paper some time ago about feeding a mare Black Haw to prevent slinking colt. Is it kept in drug stores? And how much do you feed? (I suppose it is fed in the grain.) How often do you feed it?—Ohio Subscriber.

REPLY—Black Haw is a drug that has been found quite useful in preventing the recurrence of abortion, especially when not of the contageous sort. It can be procurred at almost any drug store and is used preferably in the fluid extract form. Begin giving it in the feed six weeks before the usual time of abortion and continue until that period is safely past. The dose at first is usually one or two drams twice a day, which may be increased to one-half ounce or even more. Should threatening symptoms of abortion develop, increase to an ounce two or three times a day.

PERIOSTITIS—I have a two and a half year old mule, and a knot came on his right fore leg on the outside and continued to grow until it reached his knee joint and he became lame. The knot is just below his knee joint. Please tell the name of it and the remedy.—Mississippi Subscriber.

REPLY—It is quite likely that your animal has received an injury which has set up an inflammation of the

Percheron Stallion.

Black, small star; four years old; sound and a good breeder; weighs a ton. Broke to all harness and is in a splendid breeding condition. If interested, come and see his colts and see him perform. Sold for no fault. **Wm. Freitag, Minier, Tazewell County, Ill.**

150 PERCHERON MARES, STALLIONS, JACKS, MULES AND JENNETS.

For a number of years I have been breeding Percheron horses and mules. This season I have decided to quit the business. I offer my mares, mules, jacks and jennets for sale at reasonable prices. This is good stuff. **H. D. Hallock, Englewood, Kas.**

150 STALLIONS.

Imported and home-bred stallions. I guarantee to sell you stallions for less money than any firm in America. Come to a Live Horse Market and see all draft breeds. Reference, any Bank in Creston. **A. Latimer Wilson, Creston, Iowa.**

Draft and Coach Stallions

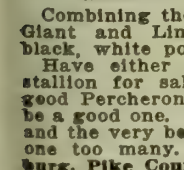
A fine bunch of Percheron, Belgian, French Draft and Coach stallions for sale; priced from $350 up. I have the big ton kind that are right. Come and see me, or write. J. M. Nolan, Paola, Miami County, Kas.

PERCHERONS.

Imported and home bred stallions and mares, from $200 to $900 each. **H. Redenius, Rushmore, Nobles County, Minn.**

BARGAINS! I am cleaning up my stock of Big Jacks and Draft Stallions

And am making the lowest prices you ever heard of for stock as good.
Just come here, pick out what you want and if you don't buy it won't be the fault of the price.
I don't believe in having any good, serviceable stock left when the season ends, and this is the way I keep from it. Come and see.



W. J. Finley, Higginsville, Mo.

JACKS AND MULES

We have 14 jacks from one to six years old; have lots of bone, size and quality; all black with white points.

Also have 128 yearling mules, coming two year old, and 26 mule colts. These mules are from grade draft mares; have lots of bone and width. Only 15 out of the 154 are horse mules, the balance are mare mules. Will sell at reasonable prices. Scott, Abney & Jenkins, Virden, Macoupin County, Ill.

JACKS.

20 good black jacks and some good jennets; coming 3 to coming 8 years old. Large, heavy boned, broken to mares and prompt servers. Prices reasonable. Come and see me. Barns 2 miles from town.

Phil Walker, Moline, Elk County, Kas.

TWO BLACK JACKS

for sale. Six and eight years old; good breeders. One 64 inches high; 70 inches heart girth; 9½ inch shin. Price $600. The other 61 inches high; 64 inch girth; 7¼ inch shin; blocky built. Price $400. Either one of these jacks will pay for themselves in a single season if rightly handled. Good terms to good parties. No trades. **G. T. Poage, Garrison, Mo.**

JACK BARGAIN FOR SURE.

Owing to lateness of the season will make a special cut on a very high class young jack—one of the few jacks that will work on the range. Also have an old jack that in a good country would make anyone a small fortune. You can impregnate from him successfully without extractor or capsules. Write for full particulars and prices. We now hold the record for two and three year old jacks in West Texas.

McLaughlin Ranch, Water Valley, Tex.

FAIRVIEW JACK AND JENNET FARM

32 Jacks and 35 Jennets, the best that grow, 14½ to 16½ hands high—jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address

J. C. HUCKSTEP, Eolia, Pike County, Mo.

KENTUCKY JACK FARM
Established in 1884.

A fine lot of black Mammoth Kentucky jacks. Big bone and plenty of weight. Will sell at special prices in order to make room for young stock. We sell more jacks to the Western trade than any breeder in Kentucky. Write for prices or come and see me. Guarantee to please our customers.

Joe E. Wright, Junction City, Ky.

EIGHT JACKS FOR SALE.

Combining the blood of Autar, Black Giant and Lime Stone Wonder; all black, white points.

Have either a trotting or a coach stallion for sale or will trade for a good Percheron mare or jennets. Must be a good one. These horses are sound and the very best of breeders, but have one too many. Chas. Wyatt, Petersburg, Pike County, Ind.

JACKS AND STALLIONS

I can furnish a few extra good registered jacks and jennets, also a few choice draft stallions, for less money than any one. L. Donaldson, Olney, Lincoln County, Mo.

QUIT BUSINESS SALE.

Two large Mammoth jacks, 16 and 16¾ hands high; coming 5 and 6 years old next July. Come and see them. I could truthfully say much in praise of these jacks, but they will do the talking. **Louis Koenig, Solomon, Dickinson County, Kansas.**

bone which has extended to the knee joint, causing lameness. It is somewhat of a question about this animal's recovery. We would recommend that you apply the following, after first clipping the hair from over the parts: Powdered cantharides, one ounce; biniodide of mercury, sixty grains; vaseline, four ounces. Mix all together and apply with the hand, rubbing in briskly for several minutes. Tie the animal so it cannot reach the parts with its nose, and permit to remain on for 24 hours. Then wash the parts with very warm water and good soap and when dry, apply a little cotton seed oil once a day for several days. Repeat the blister in three weeks.

PERHAPS STRANGLES—I have a colt foaled last night with a lump on each side of its throat the size of a walnut, and there is a rattling there when it is sucking. The mare has had a discharge from her nose (at times) for a day or so for the last two months. There is a good deal of distemper through the country, but I have not had it. One of my geldings has been affected the same as the mare. Both are in fairly good condition and have worked every day all spring.—Iowa Subscriber.

REPLY—It is quite unusual for an abscess to develop so soon after birth, but inasmuch as your letter indicates strangles is prevalent in your locality, it may be the young colt is affected with the disease. In cases of this kind avoid exposure and encourage the development of the abscesses by applying warm poultices to the parts. Open the abscesses as soon as pus has formed. Vaccinate all young stock on the premises, using bacterin.

LAME MARE—I would like to know what is the matter and what to do for my pure bred Percheron mare. She is three years old; she seems to be stiff or paralyzed in her right hind leg. She foaled a colt April 26th. The colt looks fine and the mare eats well. The trouble can only be noticed when she is moving about.—Kansas Subscriber.

REPLY—You do not state whether or not the lameness dates from the period of foaling. Your description of the case is so meager that we would suggest that you take your mare to a good veterinarian so that a careful examination of the parts may be made. Permit us to suggest that you see to this promptly, inasmuch as you have a valuable animal.

OLD, SLOW JACK—I have an old jack that has been serving mares for several years; has not been very well cared for, for about two years, but is in very good shape now. He got out with a jennet and served her. A week later I bred a mare to him and since that time he will not serve a mare nor pay much attention to them. Owing to his age, I think he needs something like "jack tablets," or something to make him keen. If you think this will help him to serve mares, please tell me at once what to get and where to get it.—Texas Subscriber.

REPLY—Clip the jack; screen his stall and have his teeth fixed. If he is not eating good soak the feed from one feed to the next in a galvanized bucket. Slow jacks should be encouraged to eat oats with a little bran. In soaking the feed, a little salt might be sprinkled on it. Throw a clean cloth over the bucket so the flies will not contaminate the feed. Always clean the bucket after soaking each time. Get some urine from a jennet that is in heat and when you are ready to breed the mare, put a little urine on the mare's tail and let the jack smell it. Be very gentle with the jack. Have the mare placed in the pit substantially. Do not try to make too many services with an old jack. We do not think you need any "jack tablets." If a lot of breeders would forget about drugs and use more good horse sense, better results would follow. If you have a jack worth keeping, it will pay you to take better care of this animal.

JACK QUITS SERVING—I have a coming three year old jack that has quit serving after serving thirty mares. He was broke with a mule a few times. He was working well when he quit with the exception that he came off a little proud. He was playing through a door with my stallion. What can I do to get him started? Will he be all right next season?—Oklahoma Subscriber.

REPLY—We do not know what connection playing with your stallion had in this case. It might be serious to have your jack stop, but if everything was normal it might be well for the future of your jack not to make any more services this year. If you wish to breed more mares, you might get him started by getting a little urine from a jennet that was in heat and placing it on the mare's tail. We believe your jack will serve all right next year if you do not allow him to associate with mules or jennets.

MAKING THE ENTRANCE—Will you kindly tell me what causes my horse to do this way? Nearly every time I breed a mare he will come up all right, but just as he goes to make the cover his penis will get big. I am not using him to tease with and always bring him up just as soon as he is ready. He is very keen, but easy to handle. He is a registered Percheron five years old and weighs 1750 pounds; is in good flesh. I give him three or four miles on the road every day and let him eat grass about one-half hour every day. He runs in a big lot part of the time. He works all right every cover and seems to be sure, but I do not like for him to do this way.—Kansas Subscriber.

REPLY—When the stallion makes the leap put three fingers of the left hand in the vulva, allowing the back of the hand to cover the rectum. Guide the penis with the right hand and do

Warranted to Give Satisfaction.

Gombault's Caustic Balsam

Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.50 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

The Fine Horse and Jack Auctioneer of the West

I sell more horses and jacks than all others. Terms always right: work always up to the highest standard.

Tell Me How Many Head of Stock You Have

and I'll feed them 60 days before you pay. I'll show you how to make your farm animals grow faster, thrive better, put on more flesh on no more feed — make you more money.

I'll Rid Them of Worms or No Pay.

I'll Prove it to You as I have to these and Thousands of other Farmers.

"I was losing from three to five sheep per day when "Sal-Vet" arrived. Three days after I put it where the sheep could get at it, the losses stopped and I haven't lost a single sheep since."
Arthur Holloway,
Mgr. Monument Sheep Co.
Monument, New Mex.

"There is no doubt that "Sal-Vet" saved my entire herd of hogs. On all sides of my farm other farmers lost nearly every hog they had. I shall always aim to keep "Sal-Vet" on no hogs"
Peter V. Carey,
Prop. Lone Sycamore Farm
Rt. No. 5 — Fairfield, Ill.

"Sal-Vet" is a wonder working medicated salt which rids farm animals of their greatest enemies—the stomach and intestinal worms. These deadly pests are the cause of 90% of all live stock diseases. They keep farm stock in a poor, weakened, money-losing condition—they mean greater liability to contract hog cholera, swine plague and other contagious diseases. "Sal-Vet" expels these parasites, sharpens the appetites, improves digestion—makes all stock grow into profit fast. Being a salt animals like and run to it freely and THEY DOCTOR THEMSELVES.

Prices: 50 lbs., $2.25; 100 lbs., $4; 200 lbs., $7; 300 lbs., $10; 500 lbs., $15; 1000 lbs., $25. No orders filled for less than 50 lbs. on this 60 day trial offer. Never sold in bulk; only in Trade-Marked Sal-Vet packages. Shipments for 60 days' trial are based on 1 lb. of Sal-Vet for each sheep or hog, and 4 lbs. for each horse or head of cattle, as near as we can come without breaking regular size packages.

Send No Money—Just the Coupon

All I ask you to do is to fill out the coupon—tell me how many head of stock you have and mail it to me today. I'll ship you enough "Sal-Vet" to last all your stock 60 days. You simply pay the freight charges when it arrives and at the end of 60 days report results. If "Sal-Vet" does not do what I claim, I'll cancel the charge—you won't owe me a penny. Send the coupon NOW.

not grasp it hard. In close mares one should run the arm in and open up the vulva so the entrance can be made quickly.

KEEPING THE SEMEN—How long can I keep the semen in the extractor by keeping the water at the right temperature, or must it be used at once? I have some customers that come in sometimes an hour late. Is it fit to use after that length of time? I am having good success with capsule breeding, only I am having some trouble in getting the semen out of the uterus. Is it necessary to go any further into the uterus than I can reach with one finger? I have the semen extractor with the bulb on it, and when I draw the rod the holes in the bulb clog with the membranes. Must you keep your finger on bulb to keep it from clogging? It seems to me that there are so many holes in the bulb that the fingers don't do much good. Is it best to push the bulb on in farther than the finger? I have failed several times in getting any semen at all out of the uterus. Is it best to screw the bulb a good ways off or only a few rounds?—Missouri Subscriber.

REPLY—Boil your extractor before using each time. Boil the water in the pan you expect to keep the extractor in; put in a tablespoonful of salt to each gallon of water before boiling it. Have several large jugs filled with boiled water that has been cooled. Place a box under the pan in which you are keeping the extractor; put two holes in the top of the box; put two number two lamps in the box under the pan; regulate the flames from these lamps so that the water in the pan will keep the temperature at 100 degrees F. With a little regulation this can be done accurately. Breed a mare; get the semen in the extractor; close the point protector by screwing it down, which will keep the semen and the water from mixing. After the extractor has been immersed in this warm water, the semen can be kept several hours very nicely. When another mare comes to be bred, the operator and the mare owner must thoroughly wash their hands clean. The mare owner can take the extractor out of the water and hold it in such a position that the capsule can be filled. After the capsule has been filled, the point protector is again screwed so it serves as a cut off valve. In order to get the semen out of the uterus it is necessary to place the front finger on top of the soft metallic point; after it is inserted into the uterus it can be bent down to the lowest part of the uterus, making a basin and allowing the semen to flow to the lowest part of that organ. After it has accumulated the plunger is pulled with the other hand. If you will read the instructions carefully you will find printed in plain type not to screw the point protector out more than three threads from the end. If the point protector is screwed out farther than that, the mucous membranes are liable to clog the point. Occasionally they will clog the point some anyway. In that case it is necessary to wait until the mare quits straining. If the semen is not found directly in front of the cervix you can make the basin at either side of the uterus by pushing the cervix to one side or the other very gently. The semen may be found in the other end of the uterus. You can push the cervix in two or three inches and get the semen in either horn. This should also be done gently. There is practically no excuse for any breeder not getting sufficient semen out of the uterus of a normal mare if he will follow the instructions which have been printed in this paper. We have received very little complaint this year about getting the semen out of the uterus. The new point protector has usually made it very easy.

A THIN TWO YEAR OLD—I would like to have your opinion about breeding a two year old colt the last of next month. She has the distemper very badly now. Would it be all right to breed her? What would I give her to make her pick up in flesh again? She has gotten awfully thin in flesh since she took the distemper.—North Dakota Subscriber.

REPLY—You will do well to turn this horse on grass and feed her a little oats twice a day. We do not advise breeding her, as she will not make a good growth this season. Give her a chance to get a growth next year.

CRUSHED OATS

ARE FAR BETTER FOR HORSES and cattle than ground feed. Get a **"NATIONAL"** Oat Crusher. Up-to-date stock farms are rapidly adopting crushed feed. Hand and power sizes. Send for catalog. Agents wanted.

W. R. BELLOWS CO.,
97 Warren St., New York.

A DISEASED MARE—I have a mare that has been bred to a jack two weeks, that is discharging a sticky stuff; at first it was yellow color, but now it is about white.—Oklahoma Subscriber.

REPLY—It is quite likely that you have a diseased mare. If in heat at the next heat period have her treated.

CORRESPONDENCE VETERINARY COURSE—I wish your opinion as to a correspondence veterinary course. I realize that success depends upon the ability of the student, even at college. I desire the course mainly to handle the minor ills and necessities of our own stock, but desire to know whether such schools are competent. If so, please name one or more.—Kansas Subscriber.

REPLY—We do not recommend a course of this kind. If you intend to make this your occupation, you will find it profitable to attend one of the best practical colleges. After you have attended one of the best colleges and worked hard attending every lecture and demonstration during the entire prescribed course, you will then discover, when put to the practical test, that your knowledge is not yet complete. If you expect to be a veterinarian, our advice is to attend a recognized institution and not simply be satisfied with a diploma, but continue to be a student. This field of labor is progressing and many new things are being brought out. Even those who have passed the required examinations in recognized institutions must study to keep up with the times. There is a great field for practical men who will qualify themselves in veterinary science, but those who do not wish to master this profession ought to take up some other occupation. The time has passed in most localities where an individual can include numerous occupations and yet be called a veterinarian. We do not advise you to spend your money on a correspondence school in veterinary science.

DIAGNOSING PREGNANCY—A patron of mine bred a mare to my horse August 31, 1912. She has never been in foal before. About April 20, 1913, she showed some signs of being in heat, but when tried to the horse she refused and would have nothing to do with him. In about four or five days afterwards she showed signs again; was retried to the horse, but would have nothing to do with him this time. What is the cause? Could the mare be in foal and act this way? Did we do right in not letting the horse serve her?—Illinois Subscriber.

REPLY—Every breeder that owns a stallion or jack should learn how to make a rectal examination to tell whether a mare is in foal or not. Many mares lose their colts by being bred while pregnant. It is not advisable, however, for the average breeder to attempt this unless he has had some special instructions, as he might do serious damage—neither would he know what to look for. This mare could be in foal and still act this way. You did right in not letting the horse serve her. It is not advisable to take chances on causing an abortion when there is evidence that the mare might be in foal. Many mares will receive the embrace of a stallion while pregnant.

RANK STALLION—I have a ton stallion in good flesh, not too fat; five years old. He has never been crowded. Have owned him three seasons. The first of the season he mounts a mare; seems to try hard, but can't discharge. Sometimes I will let him on as many as six times before he will discharge. Sometimes he will perform for ten or fifteen days and then there will be a week that he will mount a mare three to six times before he discharges. Exercise does him no good. He is as sure a stallion as I ever owned. Can always tell when he discharges; he seems to try awfully hard and is always ready. He is worse when he does not cover regularly. I bathe his privates with cold water sometimes and think it help him. When he can't discharge he gets mad and bites the mare. Please tell me what ails him. I have had three of this kind and they were all good, sure breeders, but some men get scared and think their mares might get hurt, but the mares generally get in foal.—Indiana Subscriber.

REPLY—Before you breed a mare, sprinkle some hay under the stallion which may cause him to urinate. Do not tease with this stallion if you can help it. If used as a teaser put him in the barn; take the bridle off and close the door so that the penis will be drawn up in the sheath. Get your mare all ready; put the bridle on quickly and let him mount as soon as the erection is sufficient. Let the mare take a step or two if possible; this will help him wonderfully. If this is not a success, put him in the barn for half an hour and try him again. You will find it profitable to put three fingers of the left hand in

GET A SPECULUM

if you want to know the condition of a mare's genital tract and whether or not it is diseased. A Speculum is also the only means of examining the cervix to make sure if a mare is in foal. Many an abortion has been caused which the use of the Speculum would have avoided.

This Speculum is made of good material, nickel plated, and with proper care will last a life-time. **SENT POSTPAID FOR $3.00.**

THE KANSAS CITY IMPREGNATOR CO.

Johnson Automatic Stallion Bridle

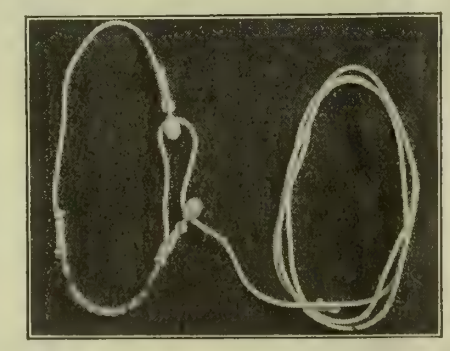
(Patent Applied for Nov. 10, 1909.)

Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.



"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning, Jr., at once. Send by mail. —Val. Thomas, Jr., Hopedale, Ill."

"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one.—E. A. Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not not use with a chain under his jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he can not say too much for it.—De Mott & Son, Scottsbluff, Neb."

PETER YOUNG
Assumption, Christian County, Illinois.

"CONQUEROR" STALLION BRIDLE

GUARANTEED TO HOLD ANY STALLION OR JACK.

This bridle is made of especially selected material, absolutely the best on the market.

Can be adjusted to fit any size head and for either hard or tender mouths.

Just the thing for breaking runaways or kickers.

Never tie an animal with this bridle. If he got to pulling he could split his head.

We prepay the postage or express charges and sell these bridles at $2.50 each.

KANSAS CITY IMPREGNATOR CO.,
12th & Central Sts., Kansas City, Mo.

the vulva so as not to take hold of the penis any more than is absolutely necessary. Gradually diminish the oats and feed a little more bran.

BREEDER'S BAGS—I have an imported Percheron stallion, 14 years old, that served 50 mares as good as any horse, and now he makes the cover all right but cannot discharge. Covers all the mares very proud. Could you tell me the trouble? The veterinarian is giving him strychnine tonic. The man taking care of horse left him out in open lot one hot day. The horse was not accustomed to it and was sick for a day or two but seems to look all right now. I never allowed him to go to but two mares a day; he did this two or three times before being sick. We never noticed him doing this until we used the breeders' bag on him.—Kansas Subscriber.

REPLY—Lead the mare out so as to cause your stallion to get an erection. Bathe the penis in warm water, beginning at 105 degrees and gradually increase to 110, if he does not object; then change it to cool well water without any ice. Do this two or three times a day. Get your stallion to urinate before you make a service. Do not take hold of the penis to make an erection if you can keep from it. Do not use the breeders' bag any more on this horse. Some horses are very easily spoiled with breeders' bags.

THE BEST SEMEN—Which is the best semen, the real thick or the thin? I have never been able to find any live spermatozoa in the thick semen; sometimes I find plenty of them, but no motion.—Kansas Subscriber.

REPLY—There is very little difference concerning thickness of semen. The spermatozoa are more readily recognized in thin semen. In thick semen there is not the same opportunity for active movement that may be found in the thinner fluid.

SLOW JACKS WANTED—I notice an article in your paper about a three year old jack that won't serve. I believe if I had him I could work him. I worked one that had not served a mare for two years; he is a quick performer now. I wish I could get hold of that three year old jack; I like to monkey with them.—Kansas Subscriber.

REPLY—If you will place an advertisement in the American Breeder asking for the owners of slow jacks to give you a description and the lowest cash price, in the first letter, you will get some mail, because there are a lot of slow jacks. Many of these jacks can be made good performers in the hands of the right man, and especially young jacks. An individual who really likes to handle this class of stock could make big money by purchasing good individuals of a tender age. When a breeder is trying to make a service with a jack that will not perform, and he has been working with him for several hours, it would not be advisable for anyone to make an offer on such an animal unless he expected to buy. There is nothing quite as disgusting as to have a jack that won't serve. There is, however, a reason for a jack not being a good server, and in nearly every case this fault can be traced directly to some man who has spoiled the jack. A jack is a very peculiar animal. Its disposition must be reckoned with and it certainly behooves owners of these animals to be very careful how they are handled.

EXERCISE AFTER SERVICE—Is it a good plan to exercise a stallion just after serving a mare, or is it better to let him stand a while?—South Dakota Subscriber.

REPLY—There is no serious objection to exercising a stallion soon after service.

MARE DRINKING COLD WATER—Is it advisable to give a mare a drink of cold water just after being bred? How long after being bred may a mare be kept from drinking water?—South Dakota Subscriber.

REPLY—A mare might drink enough cold water to cause some trouble along the digestive tract, but a reasonable quantity should not cause serious damage at most any time. If a mare is not used to drinking cold water it might not be advisable to let her have much cold water at that time.

BREEDING JENNETS—When is a good time to breed a jennet after she drops a colt?—Tennessee Subscriber.

REPLY—You will have better results by breeding your jennets on the ninth day with a capsule, without teasing them. It would be better if they cannot see or hear a jack. If they are to be bred with the natural service, they may come in heat on the eighth or ninth day, or may not show any signs until the 16th day. Some of these animals are very irregular at this time. If this jennet has thoroughly cleaned we would advise breeding her as soon as she comes in heat.

CARE OF MARES—Will you please publish some good rules or instructions for care of mares during the breeding season. I have seen a great deal printed regarding the care of pregnant mares, but none at the breeding season, which I consider just as important as care at foaling time. I have had far more trouble getting mares to settle than to foal. What I want are good practical instructions which a common farmer can carry out. —Illinois Subscriber.

REPLY—There is no great secret about the proper care of breeding stock of any kind; just use plain common sense. We will take the time, however, to mention a few of the wrongs that are practiced on mares that are expected to breed regularly. First, they are too frequently improperly fed, that is, too much of an exclusive corn diet; are too fat. Second, they are improperly worked. Brood mares are too frequently thrown into the collar without preliminary preparations and worked beyond their strength. Such practices result in rapid loss of flesh, general depletion and lowered vitality. Many are overcome with heat and generally deranged so that they are unfitted for breeding. Added difficulty comes from the greatest stress of farm work being at just about the period of breeding, and complaints develop that mares do not conceive. Again, we must allow for infectious diseases that so frequently assert themselves during the spring months. The mare already with foal or with the young foal at side, deserves more than ordinary care. Again, let us emphasize the fact that more good, hard sense be exercised in regard to the brood mare. Give her a chance. It is unprofitable not to do so.

STALLION LOSING FLESH—I bought a stallion in Oklahoma and shipped him here. He has always been a sure breeder. The reason for changing locations is that we had been in one place so long that most everything in the line of mares were related to him. I shipped him here about two weeks ago. He was in the cars for six days without lying down. He seemed well and ate well while on the road. Since I got him he doesn't eat grain well and is awfully nervous and is losing in weight. He weighed 1800 pounds when I loaded and he now weighs 1625 pounds. He works good; serves fine. Today I bred seven mares at two services. I use an impregnator. Today is the first time I have used the impregnator since I came here. I noticed both times that the semen looked brown through the glass; the little he spills looks clear and good; he spills but very little. Of course I have not been here long enough to know whether the mares will settle or not. The horse has not had as much exercise as he should, possibly; have given him about one mile each day up to three days ago; since then I have been giving him about three miles each day, but he doesn't eat any better. I keep him in a livery barn where there are horses around all the time, so he doesn't get lonesome. I have some mean competitors here. Would it be possible for some one to give the horse something that would color the semen and make his breeding uncertain? Would the change in climate cause the trouble? The altitude is 6,000 feet. I feed bran and oats mixed half and half and prairie hay with a feed of cane occasionally for a change. Could you help me in anyway? Is there any way that I may know whether the semen is good without waiting the 21 days? In case he could not get a mare in foal, what would you suggest?—New Mexico Subscriber.

REPLY—Change of surroundings with the opening up of the breeding season is apt to cause some loss of flesh, but we fear your stallion is losing more than can be accounted for in that way. We fear you are feeding too much bran. Try and induce him to eat more good, clean, heavy oats. It might be well to even give him two or three ears of corn at a feed if he relishes it. Also a moderate amount of clean, white wheat middlings will help to hold his flesh. A little old process oil meal should be good. Use him carefully and avoid fretting him. He may have too much company from other horses and is fretting on this account. By all means look carefully to his grooming. Let him be well brushed with a good bristle brush and go over thoroughly with a woolen cloth. Study your animal and you will soon be able to deside wherein is the trouble. The use of a proper microscope will show you whether the horse's semen contains live spermatozoa.

LAME MARE—I have a grade Percheron mare nine years old that is lame in the fore legs; got that way about a year ago; was pricked in shoeing and went lame and has been lame ever since. Seems to be in feet, but can't locate it. She will be very lame when she starts to walk, then get all right as long as I keep her moving, but will limp some when started up again; stands with front feet stretched out forward.—Missouri Subscriber.

REPLY—We have doubts about your mare being still lame from the effects of a nail prick that occurred a year ago. Your limited description is more like the symptoms of chronic laminitis. Arrange a stall so that this mare's forefeet can be immersed in a mud bath and stand her in it three or four hours both forenoon and afternoon. Be sure that she stands level, not too low in front. Continue this treatment for at least a week, and if she improves, which she should do, keep up the treatments at periods for some time. Let us hear from you further regarding the case.

THE RIGHT WAY

IN ALL CASES OF DISTEMPER, PINKEYE, INFLUENZA, COLDS, ETC., of all Horses, Jacks, Mules, Brood Mares, Colts, Stallions, is to

SPOHN THEM

On their tongues or in the feed put Spohn's Liquid Compound. Give the remedy to all of them. It acts on the blood and glands. It routs the disease by expelling the disease germs. It wards off the trouble no matter how they are "exposed." Absolutely free from anything injurious. A child can safely take it

50 cents and $1.00; $5.00 and $10.00 the dozen. Sold by druggists, harness dealers, or sent, express paid, by the manufacturers.

Special Agents Wanted.

Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

O. P. WILSON SERUM CO., Kansas City, Mo.

Enclosed find my check for $5 for a package of your "Jacksorine" for jack sores. This is for a neighbor and shows on its face that your salve is doing my old jack's leg some good.

June 5, 1913. W. H. HAYS, Bloomfield, Ky.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in a substantial box and sent promptly by mail. It is a paste and applied with a small brush.

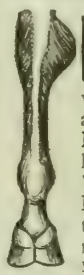
Send money by bank draft or P. O. money order. Price $5.00.

O. P. Wilson & Co., 3754 Wayne Avenue, Kansas City, Mo.

Stannard's Processed Crude Oil

THE BEST DIP MADE

for killing lice and curing mange. One application will do more to kill lice and cure mange than three applications of any other dip made (it destroys the nits). . .....$5.00 for 52 gal. bbl.



I also carry a full line of lubricating oils.

I will pay $1.25 each for my crude oil barrels; $1.50 each for my refined oil barrels, returned to me at Coffeyville, Kas., in good order, less freight charges on same.

THIS PONY FREE

WE WILL GIVE YOU OR SOME OTHER BOY OR GIRL THIS PONY WITH COMPLETE OUTFIT

"Peaches"

Is about the cutest little three-year old Shetland Pony we ever gave away. The Pony Editor who has already selected 105 prize ponies, which we have given to boys and girls, picked him out of one of the largest Shetland Pony herds in the United States. "Peaches" with his beautiful silky black and creamy white markings makes you think for all the world of nothing so much as "Peaches and Cream" and he is just as good as he is handsome. He is about 42 inches high and weighs around 300 pounds. Hitched to his nobby pony buggy which we give with him he just steps right into the breast collar with his wide Sheltie chest and will haul you and all your girl and boy friends that can pile in, up hill and down just about as fast as most big horses. Then if when you get him you want to take a canter across the fields and through the woods, just slip on his beautiful Indian horse hair bridle and tighten up the dandy saddle (which we send too) and off you go to a lope, trot or canter for the jolliest sort of a horseback ride. If you send us your name and address and get "Peaches" you will have the handsomest Pony Outfit that ever came to your place and with all charges paid by us. You'd be the envy of every boy and girl in your town with "Peaches" and his dandy outfit, but if you want him you must send us your name and address today.

This is "Peaches"

The Outfit

The 105 children to whom we have already sent ponies and pony outfits say our outfits are the nicest they ever saw. We wouldn't want to give you such a handsome pony unless we also sent you the best kind of an outfit to go with him. We send just the nicest kind of a four-wheeled pony buggy—one that "Peaches" can pull easiest and one that you and also your father and mother can ride in most comfortably. The harness too sets off "Peaches" to best advantage and is a real Shetland Pony harness. And we want to tell you about the wonderful Indian horse hair riding bridle which we give to use with our special pony saddle. Don't believe you ever in all your life saw such a pretty bridle. It is made especially for us by an old cowboy at Deer Lodge, Montana. It takes him and his partner two whole weeks to weave this handsome bridle out of beautifully colored horse hair,—red, blue, yellow, white and black,—woven into remarkable Indian designs and mounted with colored rosettes and the horse hair reins ending in a real cowboy quirt. No matter how many Circuses or Pony Shows come to your town or no matter if some children of rich parents in your place happen to have ponies, nobody ever saw a prettier Pony and Pony Outfit than "Peaches" and his, which we shall send to you or some other boy or girl. If you want this lucky boy or girl to be you, you must send us your name and address now.

Send Us Your Name Today

If You Want To Own "Peaches"

As soon as we hear from you we we tell you how to go ahead to get "Peaches." Don't let anybody persuade you that you cannot get this beautiful little pony because our plan of giving away ponies is different from others. The fact that we have already given 105 ponies to 105 boys and girls all over the United States from the state of Vermont to the state of Washington, many going over 1500 miles from St. Paul, is proof that we give ponies away. The banker or postmaster in your town knows that the Webb Publishing Co. of St. Paul, who have been in business over 30 years, is one of the largest publishing firms in the United States and can afford to give ponies to boys and girls to advertise our papers. We never heard of one of these 105 boys or girls until they wrote us they wanted a pony and you should send us your name and address at once if you want us to send you "Peaches" and his dandy outfit.

THE PONY EDITOR AT THE PONY FARM PICKING OUT "PEACHES" FOR YOU OR SOME OTHER BOY OR GIRL.

We Have Given Away 105 Ponies

MAIL THIS COUPON TODAY OR COPY ON A POST CARD

THE FARMER'S WIFE,
565 Webb Bldg., St. Paul, Minn.

Please send me Certificate of Entry, and pictures of "Peaches" and tell me how to take care of Shetland Ponies. I haven't any Shetland Pony and want to own "Peaches."

Write Your Name and Address Here

GOOD FOR 1,000 VOTES FOR "PEACHES."

Name.....

R. F. D. .....

P. O. ..... State .....

NOTICE we print the names of 27 of our 105 lucky pony winners which we wouldn't have done if it were not true that we give away real live Shetland Ponies. We haven't room to print the names of our whole 105 lucky pony winners but we will send you their names just as soon as we hear from you. Possibly some of these 105 lucky pony winners live in your county or some county near you and if so you probably know them because our lucky pony winners are now the best known children in their locality. However, it doesn't make any difference where you live if you send us your name and are the lucky boy or girl to get "Peaches," he and his whole outfit will be sent without one cent of cost to you. If you send us your name the day you read this we will send you 1000 free votes for "Peaches" and will send you a big surprise which will double your chances of getting a Shetland Pony even if you fail to get "Peaches."

Each Contestant A Prize Winner

The Farmer's Wife will liberally reward all children who send their name and address and become a contestant for "Peaches" with cash or other valuable prizes of their own choosing. Besides the Pony Outfit and Twenty-five Grand Prizes we shall offer Gold Watches, Base Ball Outfits, Gold Bracelets, Fishing Outfits, Fountain Pens, Hand Bags, Flash Lights, Rifles, Shot Guns and dozens of other desirable prizes. Of course "Peaches" and his Outfit is the best prize of all, and you should not let anybody persuade you that you can't win him because you have the same chance as any other child.

Send Your Name Today

Our ponies are given away so quickly that you will stand a better chance to get this one if you sit right down and write us a letter or a postal card or send the coupon opposite filled out with your name and address (either way will be all right). The work we require you to do to become a contestant for "Peaches" is so easy that any boy or girl who could drive a pony can do it and any child who becomes a contestant will win a fine prize, even if he fails to win "Peaches."

BE SURE TO ADDRESS YOUR POSTCARD OR ENVELOPE TO

THE FARMER'S WIFE

565 WEBB BUILDING,
ST. PAUL, MINNESOTA

"Mac," Ruth Mead, Saline Co., Missouri

"'Mac is so gentle and good natured and will stand with his fore feet on the porch or on a box and let us slide off his back to the ground. I wish every little boy and girl had a pony and cart like mine and had the jolly time I have with 'Mac,' and I hope they will write to The Farmer's Wife and get a pony half as nice as 'Mac.'"

Part of a letter from one of our 105 Lucky Pony Winners. We haven't room to print all of it here nor the other 105 letters telling about the fun our 105 Lucky Pony Winners have with the ponies we gave them and the kind of fun you will have if you send us your name and get "Peaches."

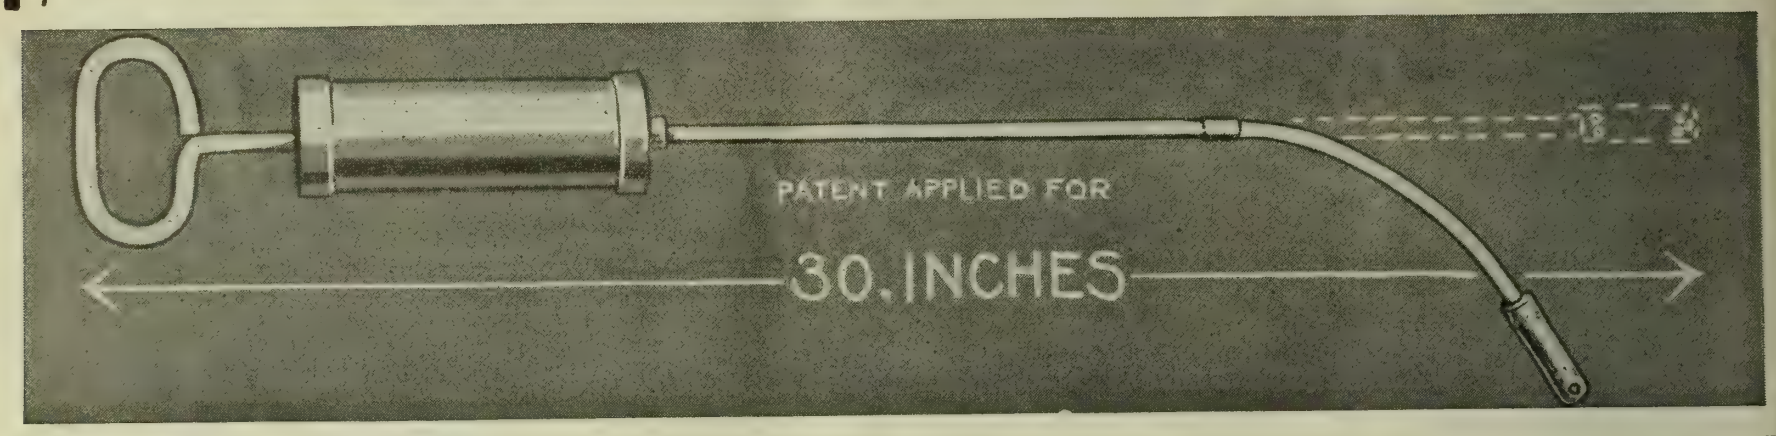
THE AMERICAN BREEDER

A Farmers' Paper, Devoted to the Breeding and Care of Their Live Stock, and the Welfare of Their Families and Homes.

Published Twice a Month. Subscription Price, $1.00 Per Year, or $2.00 for Three Years, Payable in Advance.



Volume VI. ***Kansas City, Missouri, July 5, 1913*** ***Number 12***

Graham Publishing Company, Inc., 225 West Twelfth St., Kansas City, Missouri

BREEDING APPLIANCES OF ALL KINDS

THE IMPROVED CARLSON SEMEN EXTRACTOR AND CAPSULE SYRINGE

This extractor has been improved so that it is much easier to use. The proper temperature can easily be maintained. Anyone should have good results with this instrument by following the directions carefully. This is the only instrument made that has been successfully used for getting the semen from the uterus. We believe this instrument with its improvements will make it possible for any ordinary breeder to use the capsule system successfully. It has a soft metallic point that will stand bending a thousand times. All necessary directions will be sent with the instrument.

SPECIAL PRICE ON EXTRACTOR AND CAPSULES

Until further notice we will sell 1 box of 50 pointed breeding capsules (price, $1.00), and one Improved Carlson Semen Extractor, complete as described above (special price, $6.50), ALL FOR $6.50.

Pointed Breeding Capsules

We have the only capsules made especially for horse breeding Some capsules do not dissolve, leaving a foreign substance in the uterus which will prevent conception. Other capsules are too flimsy to use for this purpose. You cannot make any mistake by buying capsules from us as we only have one kind. We have them boxed with 100 in each box. The box is tight so they will be clean. These capsules are properly baked and all bacteria killed before they are mailed. Always keep the lid on the box when not in use.

Price per box (100), $1.50.

Bulb Impregnator

This is the best bulb impregnator on the market. Some dealers sell for $5 and $6.

Price, $2.00.

Veterinary Thermometers

This thermometer is recognized and used by the leading veterinarians for taking the temperature of animals. It has a metal case which insures it against breaking and will last a life-time. It has a small chain with pin in it that may be fastened to the vest pocket and carried with safety.

Price, $1.25.

Thermometer

Tested and used for keeping water at the right temperature.

Price, $1.00.

Breeding Hobbles

We have heretofore handled breeding hobbles made by reputable firms, but we have received so many complaints that we are now manufacturing our own hobbles. They can be adjusted to fit a small pony or the largest draft mare. We believe these are the only hobbles made large enough for draft mares. Most hobbles are made to fit the common race mare.

Price, $8.00.

Emasculator

This emasculator (improved style) is made by the Kny Scheerer Co., and bears their trade mark. It is guaranteed to give satisfaction. If it breaks within one year or gets out of order, return it and get a new one. This instrument is made of the very best steel. It is the latest method, only having three pieces and can be taken apart very easily and thoroughly sterilized. It operates perfectly. Price, $7.00.

Microscopes

For use in testing the semen of stallions or jacks. Magnifies 500 times and is used by veterinarians and physicians. Price $35.. Boxed in fine case. These instruments are of great value in the breeding business. Through them you can see for yourself and show your mare owner the live spermatozoa of your sire.

Curved Metal Impregnator

This instrument is sold by other dealers for from $5 to $6. It is nickel plated, about 22 inches long, with a glass tube in it.

Price, $4.00.

Breeders' Bags

Three sizes, small, medium and large. Stallions weighing 1,200 or 1,600 pounds usually require a medium size. These bags are guaranteed not to tear from any cause before March 1, 1914. If they do tear before that time return the top part with our stamp on it and 35 cents in cash and we will send you a new bag.

Price each, $1.00.

Directions for Ordering

Send money orders or draft as exchange is always charged on personal checks. Always name your express office as well as your post office address in order to insure prompt delivery.

POSTAGE AND EXPRESS PAID ON ALL ORDERS.

VOLUME 6. KANSAS CITY, MO., JULY 5, 1913. NUMBER 12.

BREEDING INVESTIGATIONS

Observations During Several Trips by the Editor. Good Work by Breeders Who Have Made a Scientific Study of Their Business. Cow Examinations.

A daylight railroad trip across any of the corn belt states reveals a very interesting subject for horse breeders. At this time of year most of the mares are either working or are in pasture, so that they may be easily seen for a considerable distance from the railroad. The interesting thing is, where are the colts? What has happened? Are the farmers not breeding their mares or have they failed to fertilize? This is a very important question at this particular time. The increased demand for horses and the prospects for future development in this country should create a still greater demand for the right kind of horses and mules. It would seem to us that with the prospect for future demand more individuals would study the subject of breeding more closely.

The average breeder does not have a wide acquaintance; he bases his calculations on the territory from which he receives patronage. These breeding districts, as a rule, are not producing as many colts as they should.

The thing most important at the present time (as shown by actual results) is the great number of mares in this country that are not producing colts. The editor has been visiting many localities in order to learn the exact conditions. Arrangements are made with a breeder by telephone a few hours or a day in advance, to have the shy breeding mares present at a certain time. The word goes out on the party lines that an expert will be at a certain place at a specified hour to examine barren mares. Farmers unhitch from the cultivator or leave the harvest fields with their good, big, fine mares to ascertain the difficulty. It is a common occurrence to find upon our arrival that from ten to fifty mares have been assembled for this scientific examination.

On numerous occasions when a certain diseased mare was being inspected the stallion owner was requested to look at his book and see how much damage that particular mare had done in that community. It is a common thing to find that from five to thirty mares had been put out of business as a result of being bred within five days after service was made on this particular mare.

When facts like these were presented to the mare owners by men familiar with these scientific breeding problems, considerable lively discussion followed. There are not many farmers who care to have the fertility of their clean, healthy mares destroyed.

The difficulty with the average breeder is that he thinks a knowledge of breeding subjects is beyond his capacity. No breeder will ever have the success he ought to unless he gets that out of his head. The average breeder who really wishes to study these problems can make wonderful progress in a very short time. Some believe that only graduate veterinarians are in a position to understand these things. They do not take into consideration the fact that veterinarians must familiarize themselves with the entire body of the animal, and that this knowledge must extend to all the different kinds of live stock, all of which require special and different attention. There is not enough practical breeding instruction given at most veterinary colleges.

It is only necessary for horse breeders to familiarize themselves with such subjects as have to deal with the generative organs, as a rule. There is practically no excuse for the average breeder not getting a better per cent of foals. With the practical knowledge that many breeders have a little study of the right kind will make a wonderful difference in their per cent of foals.

Toward the end of the breeding season is the best time to make these investigations. Mares that have been bred from two to five times during the spring months are easily remembered by the stallion or jack owner, and more especially those that are affected with disease of a dangerous nature. Only about one out of twenty of these mares get in foal, and if we estimate three services for each mare we have sixty services for one living foal from twenty mares of this class. This would not seem very profitable and should be serious enough to stimulate breeders to study the subject more carefully.

Many interesting things are noted on these trips. Perhaps the most conspicuous of all interesting things was the fact that some of those who have been in the business a great many years seem to have the most trouble with barren mares. It appears to be difficult for these older men to change their ways. They have gotten accustomed to doing some particular work in certain ways, and to make a change seems very awkward to them. Many have made changes, however. The last few years has witnessed many new improvements. But the places where we have found the most barren mares were with individuals who had never read anything on this subject or attended a breeding school. Such breeders are really dangerous to a community because they breed everything that comes and thus spread much infection. At one place where a large number of mares were examined a majority of those present were diseased. As these mares scatter out, after their owners get discouraged with this individual, they will be presented for breeding at other places. It is the history of barren mares to try one horse a while, then change to another one. Breeders who persist in giving the natural service on all the mares that come, regardless of disease conditions, should receive some enlightment on this point some way or another.

We were gratified at the results found where breeders had attended the Graham Scientific Breeding School and received personal instruction on diagnosing barren mares. There were not many serious cases found at the barns of these men. They know the danger of breeding such mares. Some had rejected them entirely while others had arranged to have them cleaned up. At one place where telephone messages had been sent out to have the barren mares present about twenty-five mares were on hand and there were thirteen foals with them, most of them from mares that had made trouble before receiving scientific treatment. Out of this number of mares there were only five mares that were still considered dangerous, and these mares were not being bred but were being prepared for the fall season. It is a pleasure to visit a breeder who is thus helping his community as well as himself. They are prepared for this kind of work; they have been taught by personal instruction the necessity of doing things right. They have been enthused by talking to other successful men. They know that results can be obtained and that it is up to them to make good. There have been, naturally, a few failures among this class of men, but it has been their own fault. They have not followed faithfully the personal instructions they received. These men also, as a rule, are investigators. They have learned the fundamental principles and at every opportunity make use of their knowledge in investigating conditions as they find them. When a mare in their vicinity dies or is killed they have their patrons call them up so that they can make examinations along the line of their special interest. This helps them with their knowledge of anatomy and establishes certain things in their mind so that they will know what to look for in making rectal and other examinations.

Several places where we visited students who had attended the school two or three years ago, diseased mares were practically a thing of the past; they had ceased to transmit this infection to other mares, and by looking up the places where newly presented mares had previously been bred they were able to protect their customers and themselves from outside infection.

Numerous experiments have been carried on with reference to carrying the semen. Henry Thomas of the King Hill Stock Farm at St. Joseph, Mo., who is a graduate of the Graham Scientific Breeding School, has probably broken all records along this line. He made a natural service at about 2 o'clock (noon) at St. Joseph and carried the semen to Omaha, Neb., and bred a mare after 6 o'clock in the evening, with good results. Others have carried the semen 20 or 30 miles and bred a large number of mares from a single service. Others have used chicken incubators with good results, while some have kept the exact temperature in a regular breeding barn so there was no difficulty as far as temperature was concerned.

We are glad to see the breeders carry on these experiments in a small way. Some men are naturally handier than others so that results depend largely on the individual in many cases. If success has been derived from a small experiment the operator can usually use it on a larger scale the following year.

The money making feature of the breeding business has been derived through the capsule system. It is remarkable how this system has developed during late years. One can talk to a farmer in nearly any locality and find that he has learned something about the capsule system. There are so many of these successful capsule breeders that it is difficult to get away from that influence entirely.

There were two successful capsule breeders in one section of the country about twenty miles apart. These men were breeding on the wholesale plan. Farmers were coming from ten to fifteen miles to patronize these places. There was very little complaint found in that section. The writer took care to travel through the country in an automobile to investigate that particular point. Capsule colts could be found on many of the farms. These farmers frequently spoke of these as "hand made" colts.

THESE ARE ALL CAPSULE COLTS.

Sired by the Breeding Stock of N. S. Cox, Pattonsburg, Mo., a Graduate of the Graham Scientific Breeding School.

Some of the students who have difficulty with scientific breeding problems engage the services of a traveling instructor, who is sent out by the Scientific Breeding School. It is his business to lecture and demonstrate for the patrons of the graduates of the school. This usually gives excellent results and the farmers are greatly interested along these lines, after an instructor has spent two days in one locality giving accurate practical lectures and demonstrations, including public examination of shy breeding mares and the dissection of a diseased mare, if one can be found. Farmers usually take to this information readily. In many instances the business of a breeder has been more than doubled by an instructor.

Our investigations have not been confined entirely to the mares, but other live stock has been included. Cows have been used as subjects, largely—to the extent of several hundred cows. The generative organs have been dissected and used scientifically.

The writer expects to spend a considerable portion of the entire summer in these investigations.

INFECTIOUS ABORTION TESTS.

To the American Breeder: We now have available at least three tests for infectious abortion that are worthy of consideration. Two of these require laboratory equipment and an expert laboratory worker. The third is called the abortion test, and is very much like an ordinary tuberculin test, abortin being produced and used much as tuberculin is.

Statements of those who have had actual experience with the abortion test are quite conflicting. At the best it must be considered as still on trial, with a possibility of some usefulness, even though it may not prove to have such general utility as the tuberculin test.

The two laboratory tests, particularly the one known as the complement fixation test, appear to be quite accurate when carefully made, but they have limitations. In other words, these tests tell us whether an animal has ever been infected with abortion germs, but give no information as to whether the animal ever has aborted or ever will. It is easily possible for an animal to be infected and possibly infectious to other stock without ever aborting, or she may be infected and abort once or twice and become an immune, but still likely to spread the disease.

In either case the laboratory tests would give the same positive reaction. It seems probable that they will have a fair range of usefulness and we may expect them to give fairly accurate information as to the presence and location of infection in the heard.—M. H. Reynolds, Veterinarian, University Farm, Minnesota.

COLT TROUBLES.

To the American Breeder:—Navel-ill in colts is a serious disease of the new born. It is nothing but a form of blood poison, the germs which cause it getting in through the navel. The cord is rather short and is first noticed to be of a dark purplish color with yellow pus. The joints begin swelling and the colt soon dies unless promptly attended to. Disinfect the navel at once with a good antiseptic and change location of mare and colt. Give colt tablespoonful castor oil with a little spirits of camphor, about half teaspoonful. If a veterinarian is called, which will always pay in the long run, he will give both local and general treatment in the form of vaccines.

Diarrhoea is another frequent trouble. The mother's milk is often the cause. See that she is not overheated or chilled. Give the mare four ounces sodium thiosulphate in a bran mash once daily for three days, and milk her out well. Give the colt two tablespoonfuls castor oil and one tablespoonful brandy in two raw eggs.

Rupture is also rather common. Colt ruptures often disappear without treatment, but sometimes require attention. —E. T. Baker, Veterinarian, Idaho Experiment Station.

THE NEW STALLION LICENSE LAW.

To the American Breeder:—As several inquiries have been received regarding the new stallion license law, a brief summary of the provisions of particular interest to stallion owners is given below:

1. The law became effective July 1, 1913. It requires that everyone who shall stand, travel, advertise, or offer for service in any manner in the state of Kansas shall secure a license certificate for such stallion from the State Live Stock Registry Board, Manhattan, Kans.
2. All licenses issued under the old law (Chapter 168, Laws of 1909) became null and void and not in force July 1, 1913, but may be renewed for the year 1914 if application for renewal be made previous to March 1, 1914.
3. Stallions will be licensed under four classes: Pure-bred, cross-bred, grade, and scrub—according to their breeding.
4. The principal purpose of a stallion license law is to verify the breeding of stallions offered for service, and under the new law license certificates will be issued without an examination for soundness accompanying the application for a stallion license.
5. The certificate of soundness will be a separate document from the license certificate. Experienced and thoroughly competent men will be sent out directly from the Kansas Live Stock Registry Board to make all examinations for soundness. These inspectors will visit from six to eight points in each county upon dates previously advertised and personal notices giving all the points and dates for each county will be sent to each stallion owner of that particular county at least a week in advance. The stallion owner will then bring his stallion to the most convenient point to be examined for soundness.
6. License certificates are issued for only one year, becoming null and void on December 31, following the date of issue and must be renewed before March 1 following the date of expiration.
7. Transfers of ownerships **must be recorded** with the State Live Stock Registry Board.
8. Fees are as follows: New license, $2.00; renewal, $1.00; transfer, 50 cents.
9. Application blanks for licenses, renewals, and transfers, will be sent to all stallion owners in the near future.
10. The method of advertising has been simplified and made more practical and effective. In the future every bill, poster, newspaper or other advertisement issued for a stallion must have as a heading for such advertisement the class and number of license issued for the stallion in question—thus, "Pure-bred License No. ——." This heading shall be in the largest and boldest type used in the advertisement.
11. The minimum penalty for violation of any provision of this law is a fine of $20 and costs for each offense.
12. Copies of the new law will be mailed to each stallion owner in the near future.

The new law is practical and fair to all parties concerned. It is definite and specific with no loop holes for wilful violators to escape. Sufficient men will be put into the field during each breeding season to enforce this law in every county.

This law was passed primarily for the benefit and protection of the mare owners of the state that they might have authentic information regarding the breeding of any stallion they might wish to patronize. In return for this protection mare owners should be more prompt in meeting their obligations to owners of the stallions they patronize, not only in returning mares at the proper time and giving them the proper feed and care, but also in settling for the service fee.—C. W. McCampbell, Animal Husbandry Dept., Kansas Agricultural College.

The sea is the great reservoir of potash. The kelp plant gathers it. We gather the kelp and extract.—United States Department of Agriculture Report.

As They do in Australia

Subscriber On Other Side of the World Writes of Breeding Conditions. Surprised at Our "Stand and Suck" Guarantee.

To the American Breeder:—The various opinions expressed by your correspondents on the subject of the collection of service fees, have interested me, and I must confess I was surprised that your stallion owners have not taken some firm stand against the existing method. To my mind, and I think at least 95 per cent of the stallion owners in this country agree with me when I say, that the practice of guaranteeing a foal to stand and suck is an absurd one. No matter how sure a foal getter a stallion has proved himself to be, it does not follow that when he serves and settles a healthy mare, a foal will result; and when a stallion owner takes upon himself to guarantee that such will be the case, he undertakes to promise that something will happen over which he has no direct control, consequently he places himself in a false position.

The rule regarding the payment of fees out here is that the service fee must be tendered when the mare is stinted, that is, when she is finished with the stallion. Some stallion owners paddock all their visiting mares and in this way they can impound the mare until such time as the fee is paid. Last year I stood a thoroughbred stallion and paddocked the mares and never lost a fee. The conditions under which I took mares to the horse were that mares were to be paid for when stinted, due notice of which would be given, and any mares not removed within a fortnight of receipt of notice I charged 2-6 per week for grass (previous to that they had free grass). Some stallion owners paddock the visiting mares right through the season (which commences on the first of September and closes about the middle or end of December), and make no charge for grass, but this depends greatly on the season. The fees, however, in these cases are paid at the time the mares are removed by their owners. When a mare fails to produce a foal, her owner usually has her served by the same horse the following year for half fee, which some stallion owners will reserve free of any charge.

The traveling stallions (I mean those which are constantly on the road; not the class which may be taken a short radius to suit the convenience of neighboring farmers) is one of our worst features in horse breeding. These parasites, I might well call them, are very well patronized, but usually leave only a small number of foals as the result of their labors. This is due to the conditions under which they exist, and as the owner of this class of stallions is concerned about the dollars only, he cares little or nothing about the number of foals his stallion is likely to beget. One of the difficulties traveling stallion owners have to contend with is the collection of their fees. Very often they have to wait months before being paid, whilst many never pay at all, consequently you can readily understand that to make up for their bad "marks" the stallion owners take many more mares than the horse can possibly get in foal. I have no sympathy for mare owners who continue to patronize stallions which they know are traveled over great areas as if they cannot forsee that such horses are of little value at the stud in the light of past experience, then they deserve to lose the service fee in return for which they receive, in the majority of cases, nothing more than a barren mare.

I do not believe in encouraging the owners of parasites on the breeding monstry, but I firmly believe your stallion owners should take a united stand and hold out for the payment of the service fee when the mare is settled by the stallion. It is a case for organization if you wish to abolish the absurdity of a stand and suck guarantee. It will perhaps take time and the mare owners may think they are hard hit if they have to pay their cash down as soon as the mare is done with the horse, but it will teach them to patronize stallions that are known to be prepotent and have proved their value at the stud. If a stallion settles some of his mares it is proof that he is virile, consequently the owner should be entitled to the service fee. I might say we have no law giving a lien over the foal in the case of unpaid fees, and the existing method of recovering fees is too costly. The states may introduce legislation later on governing public service stallions, and it is to be hoped provision will be made for a proper lien over the foal.—E. B. Comans, Sydney, New South Wales, Australia.

A LIVE CO-OPERATOR.

To the American Breeder:—In my judgment your paper just fills the bill. Below is an ad I am running in the local papers and if you will send sample copies would be glad to send you all the subscribers you want up to about 200. Have you any suggestions? —J. C. Boyles, Blaine County, Okla.

"Subscribe for the American Breeder, a semi-monthly journal, devoted to live stock improvement. While it is practically new it has more than thirty thousand subscribers and did more to purify the registration in the Percheron Society of America than all others combined. The regular subscription price is $1 per year, but I am authorized to accept subscriptions in clubs of five or more from the time you subscribe until May, 1914, for 50 cents. Now, if you subscribe and read the paper and at the expiration of you time you are not satisfied, I will accept the price in trade, giving you your money back; thus I guarantee the paper to you.

Be sure and take this paper. Send me 50 cents or see me at the Black Barn, in Okeene.—J. C. Boyles."

BELIEVES STALLION LAWS FOR THE BEST.

To the American Breeder:—In your issue of February 20th I see a letter from a son of Mr. Fish of Rock County, Wisconsin, explaining his objection to the Wisconsin stallion law. Mr. Fish states in his letter that he owned a "windy" Percheron stallion for which he could not get a license to stand his horse in Wisconsin. This particular horse, like many others, went out of Wisconsin to where they had no stallion law. Of course, Mr. Fish claims this horse never left an unsound colt. He was a windy stallion just the same, and he was obliged to sell him for this reason to a party from California. This is proof positive that the Wisconsin stallion law is a good thing for Wisconsin farmers, because like produces like; that we expect, and a vast amount of Mr. Fish's kind of stallions are leaving Wisconsin annually to a state without a stallion law.

The Wisconsin stallion law is a good thing and the Wisconsin farmers are rapidly sending the blemished stallions out of Wisconsin. My 25 years' experience convinces me that the following defects are reproduced by any stallion so affected, in a more or less degree: Cataract, glass eye, moon blindness, roaring or whistling, heaves or broken wind, St. Vitus dance, crampiness, shivering, string halt, bone spavin, ring bone, side bones, navicular disease, bog spavin, curb, glanders, farcy, maladie du coit,

urethral gleet, mange and melanosis. There are several other defects that I cannot call to mind just now. Any stallion affected with any of the above defects will leave a certain percent of his colts affected the same way.

My past experience, is when I hear a man find fault with the stallion laws of any state, is because he is restrained from crookedness. The breeder with a reputation in the future is the one that will use the knife without mercy on such colts. I remember well when any kind of a pure bred horse was kept for a stallion in Wisconsin. Today we have many pure bred geldings. At the Wisconsin State Fair of 1912 were colts of this kind. Wisconsin is progressive and the "hobo" stallion must find a home in some other state, and the state without a stallion law is sure to get them. The trash of the old country has been dumped into the United States for years. The different states are fast getting stallion laws. Importers are bringing better horses because of the failing market for trash. We will always draw on the old country for a few choice animals, but the culls will remain at home. The stallion laws of the United States are intended to restrain crooks in the business and help the honest breeder. I think every farmer that has a mare to breed should uphold the stallion law—it is for his protection.—Alex M. McLean, Rock County, Wis.

WESTERN POISONOUS PLANTS.

To the American Breeder: Five or six kinds of posonous plants on the open ranges of the Western states have cost the livestock industry millions of dollars and a practical solution of this perplexing problem has not been found.

In Colorado the most disastrous plants named in the order of their supposed importance are as follows: Two or three species of "loco" weed, five or six species of larkspur, death cama, wild parsnip, lupin and wood aster. It is claimed that woody aster is the most deadly plant in Wyoming for sheep and it is widely distributed over the Western states.

Getting rid of these poisonous plants, which cover millions of acres, seems impossible. Antidotes and "cures" have little practical significance, for animals die when alone on the range, or are wild and unmanageable.

About all that can be done by the stockmen at this time is to learn to identify the several species of poisonous plants, to know the time of year when each is most poisonous and range their livestock accordingly.—George H. Glover, Colorado Agricultural College.

FINE PROSPECTS FOR MEXICO HORSE SHOW.

A field of the greatest saddle horses in the world is announced, as entered for the $1,500 championship stake at the Mexico (Mo.) fair. This stake is backed by the Mexico Commercial Club. In the published list of entrants half the animals are state or national prize winners of some note. Entries for the junior saddle stake of $500 are even more numerous, and a good string are in for the $500 light harness stake. The show at Mexico is one of the first of the season.

IS THIS TRUE OF IOWA?

To the American Breeder:—I have a neighbor that thinks grade horses are the best to breed to, with only grade mares. He is from Iowa and he said that only about one-third of the mares there were bred to registered horses. I told him I supposed that nearly all of them were bred to registered horses, so let's hear from some Iowa breeders in regard to this.—Kansas Subscriber.

Questions and Answers

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

JACK GROWS INSTEAD OF FATTENS—I have a very fine, big jack colt, 22 months old, that I am unable to fatten. I feed him shelled oats and hay; runs on fine grass; is 15¼ hands high; large boned. Would like your advice in regard to fattening him.—Kentucky Subscriber.

REPLY—You ought to consider yourself lucky in owning a young jack of the large, growthy type. You should not expect at this early age to load this young animal down with fat, neither is it desirable. Keep right on giving him good, sound grain and good pasturage and you will find that later he will round out and make you a valuable animal.

MAMMITIS—I have a young mare that had her second colt on the 20th day of March (this year); she seems to be doing well and is fat; had her out on the range through the winter. About two weeks before she foaled I noticed that one side of her udder was broken and was running—is still doing so. The discharge is a thin, bloody pus and seems to be about the same. The colt is doing fairly well, although it gets milk from only one side. Do you think she will ever get over it without doctoring her? Is she liable to have the same trouble with her next colt, or any hereafter? Is it all right to work her while she is that way? (I have not been working her.) If it is necessary to do something for her, what had I better do?—North Dakota Subscriber.

REPLY—It would apear that the udder has been inflamed and that an abscess has formed. Abscesses in the udder are obstinate, as a rule, and difficult to heal. We would advise that you inject a small quantity of tincture of iodine into the opening twice a week and wipe off all that contacts the skin so that the colt will not get it while nursing. This condition is pretty apt to cause you some annoyance in the future at foaling time.

DROPSY—I had a mare that lost her colt and the veterinarian said she had dropsy. Would it be safe to breed her again? She was nine months along and the colt came dead. Is there anything that can be done to prevent so much water?—Minnesota Subscriber.

REPLY—Your inquiry does not make it plain where the quantity of water accumulated. If you have a good veterinarian at hand who has studied her condition, he is in better position to advise you than we possibly can.

ORCHITIS—I have a four-year-old jack that I started to make the season with and one of his testicles swelled and I quit using him. The swelling went down and there is an enlargement left at the upper part of testicle, forming a kind of ring. Can you give me the cause of swelling, also if it is sufficient to prevent him from making a breeder? Or can you suggest some treatment? I bred him to 14 mares and he settled very few, if any of them. —Kentucky Subscriber.

REPLY—You did the right thing in discontinuing your jack from service when he became affected. Orchitis is caused by injury, or general systemic disease. It is quite likely that with a season's rest the one sound testicle will be as good as ever, and if he was a breeder in the first place, he will continue to be. Whenever a testicle once becomes inflammed it is more or less permanently injured for the future, but an animal may continue as quite a satisfactory breeder, even though he has only one sound testicle.

MARE DOES NOT DRY UP—I have a mare that does not seem to dry up. I weaned her colt two weeks ago. I milk her once a day. Am feeding upland hay and very little oats. Would it do to stop milking her at once?—Minnesota Subscriber.

REPLY—Do not be in a great hurry about drying up this mare. You are fortunate in possessing a good milker. Observe the same general plan you would in drying up a cow. Let the diet be a little scanty and of a kind that does not favor milk production. Do not milk her dry and milk at gradually lengthening intervals, such as appears safe. You should watch her closely and not permit the udder to become inflammed, as that would perhaps ruin her for future breeding.

UMBILICAL HERNIA—I have two two-year-old fillies that have ruptures at the naval. Would it hurt them to breed them next spring? The ruptures are very small; they cannot be noticed unless one feels of their stomachs. Would it be safe to use the clamps on them now at two years old?—Minnesota Subscriber.

REPLY—You should have had these animals operated upon at the proper age, which means that the work should have been done when they are young. It is far more difficult to operate on animals that have reached two years. It is still possible to correct the condition, but you should consult a good competent surgeon and permit him to make a manual examination. If the openings are not large it may be safe to breed them.

INJURED MARE—I have a valuable mare that got kicked six weeks ago and her leg is still swollen. I have been working with her; have blistered it three times with caustic balsam. Now there are some lumps under the skin. It is swollen between the hock and the pastern; the hock is swollen some, too. Would be very thankful for some good information on this.—Kansas Subscriber.

REPLY—You do not tell us where the mare was kicked. Swelling of a part does not always point out the point of injury. We fear you are pushing the blistering process too much and are not giving sufficient time for the swelling to subside and the fluid in the tissues to absorb. Following the application of the blistering agent, allow the animal access to pasture for four or five days where it can have the opportunity to take exercise. Do not attempt to work an animal in this condition. At the expiration of ten days or two weeks begin to gently but thoroughly massage the parts. This will help in the process of absorption. Do not repeat the blister until the parts have been reduced as much as possible, which is usually about four weeks. Apply the blister about the point of injury only.

THINKS YOUNG JACK NOT SURE—I have a jack that will be three years old September 20; over 15 hands; big boned and masculine in every way excepting that the right testicle is about half as long as left; may be left is not quite as big as it should be. I let him serve a mare April 26th, May 2d and May 16th. He has had about nine covers spread out, and except the June 12th we know he has settled none. He has a dry lot opening in pasture of high prairie grass; takes plenty of exercise. All of my jacks have been extra sure. One I sold this spring got six live mules first six covers. I expected this one to do as well on same mares. He is fed oats three times a day, no corn. He has done fine only as a breeder. My jacks are never shut in from exercise lot and seldom from pasture when grass is right. I have raised and broke jacks for years, and have read and profited by your answers in the American Breeder, so no use to write how he has been handled. What I want to know is when to try him on mares again and if his testicles will be alike when matured? They are growing fast now. Did I use him too soon under the conditions? I think he will be a heavy jack when grown. Can I make him a sure breeder and how? I see him a great deal every day; I don't think he could [illegible] Subscriber.

REPLY—We think it a little early to pass judgment on this young, growthy jack. Give him more time. He is immature. Keep right on with your good care and it is quite likely he will come right next season. Go slow with services and do not permit them to come too frequently.

SWOLLEN TESTICLES—I wish you would give me some advice in regard to my Percheron stallion. His testicles swell up and he has been about the middle of April he had a slight cough and a sore throat and [illegible] up to 102 to 103 for a few days. I soon got his fever down to normal, but his testicles were swollen badly. I did not breed a mare for 15 days, until I got the swelling out of his testicles. I bathed them with warm water and used a solution of lead and opium, but they have been swollen and full of fever all the while. When I exercise him and breed him every day the swelling goes down; but during the night they will swell up. He serves good and feels good; is in good flesh and eats heartily. What causes this swelling in his testicles? On the start it acted like mumps. There were four stallions in this locality with the same trouble this season. I enclose photo of my stallion which was taken a few weeks ago; it will show you what condition he is in. He weighs 1,800 pounds and he is a dandy, but this testicle trouble bothers me and also the veterinarians. I would be pleased to have your advice on the matter. This horse is seven years old and he has always been healthy and he has always been worked on the farm out of stud season.—Minnesota Subscriber.

REPLY—We suspect your stallion has suffered from an attack of influenza, which is a disease frequently associated with disturbances of the testicles. It is quite likely as long as this stallion is continued in service you will have more or less trouble. If the inflammation becomes chronic your horse will perhaps be ruined. The best thing to do right now is to discontinue him from service. He should have a large paddock to run in where he may graze clean, wholesome grass. What he wants is an opportunity to take such exercise as he desires. This, coupled with light, easily digested diet, ought to put him right for you another season.

NAVEL ILL—One of my best colts is affected with navel ill, as she is three weeks old and the navel is not healed up. I thought it has healed up two weeks ago, but now she is stiff and lame and very stiff and can't get up alone, so I expect I will have to lose her in a few more days.—Nebraska Subscriber.

REPLY—Navel ill is occasioned by infection at the point of the wounded navel, and its being a very fatal disease should encourage one to take every precaution to prevent it. A badly infected case will die, so one should take no chances of a colt contracting the ailment but should use disinfecting and drying agents upon the navel as soon as the colt is born, and continue the same until the stump of the cord is fully dried up.

PEDIGREE OF AN IMPORTED HORSE—Can you tell me how to find out if a pedigree of an imported horse is genuine or not, and what it would cost?—Montana Subscriber.

REPLY—Read the description of the animal given in the certificate. See if the description corresponds exactly with the animal. Notice the certificate closely and see if anything has been changed or erased. If in doubt about the certificate, send it by registered mail to the secretary of the record association issuing such certificate and ask for his opinion.

BRINGING MARES IN HEAT—Can there be anything fed to a mare to bring her in season?—Ohio Subscriber.

REPLY—We do not know of anything that can be given these mares for this purpose. You can breed these mares with a capsule and if properly done will get just as good results as could be obtained if in heat. These mares that never come in heat are usually easily fertilized with a capsule.

WILL RECEIVE EMBRACE OF A STALLION REGULARLY—A neighbor

STALLION LIEN LAWS.

The campaign for better collection laws has proven very satisfactory. We did not expect much results the first year as it was necessary to thoroughly thresh out the proposition so as to know just how a law should be worded to be equitable to all parties concerned. It has also revealed the identity of certain individuals who will be watched during the next campaign. These politicians, although closely affiliated with the live stock business, have shown their unfaithfulness.

It was not our intention to start a campaign that would not be successful. We want all the breeders interested in this subject to know as much as possible about the conditions in their own state. More than half of the states in the Union last year introduced different kinds of lien laws. Most of those were copied after the law suggested in the American Breeder. Breeders can ascertain the exact condition by talking to their representatives or senator. There will be gatherings of horse breeders where these things can be talked over before the legislature convenes again. Copies of the different bills can be studied.

This proposition is to be a fight to a finish and we hope to be able to get the names of individuals who are opposed to measures of this kind, so that the breeders can have an opportunity to do their duty when these individuals are up for re-election. We wish to commend those connected with the stallion registration laws who made an effort to include a lien clause. Several of these individuals made a good, hard, honest fight. There are no doubt others who did not do so well. If the stallion owners will work together in harmony there will be no question but what some of these individuals who are opposed to the measures they want will be very glad to get in line. We comment with pleasure upon the good work of the breeders as a whole on this subject. There were some, however, as is always the case, who are willing to let the others do the work and yet receive their share of the benefits without any exertion on their part.

We have several good laws as a result of that campaign. North Dakota, Montana, Idaho and Nevada are the best we have heard of. We have heard of several other laws that we have not seen a copy of. Kansas passed a good law just at the close of the session, but through some mistake or trick the enacting clause was omitted so that the law has no effect. There is a very good lesson in this. Those who were loyal to the passage of the law felt safe after it was well on the way to passage and did not give it further attention or this would not have happened.

The influence of politics makes many changes in conditions and should be watched closely to a successful termination. Missouri has a very good law and it was thought best not to make any changes. An effort was made in Iowa and Nebraska to get some relief, but it seems that those who are interested in shaping the stallion inspection laws were politicians who were looking for votes and not to the best interest of the horse breeders. Horse breeders must take an interest in these things if they expect to have satisfactory results.

WESTERN HORSES AT PUBLIC AUCTION.

Those who are not acquainted with the custom of conducting a range horse sale should be a little cautious in buying or they might get some experience that would not be profitable.

The writer attended a sale where the auctioneer was disposing of a band of horses and the bid had reached a very high figure. When he paused and said:

"Gentlemen, who will make an honest bid on these horses? We want to sell them."

The other bid had reached a figure so high that he was not expecting any one to raise it.

When a lot of horses are being sold in a body the owner, auctioneer or some one interested usually gives a description which might mislead in the case of some. There is no warrant connected with this transaction, as a rule, and when the highest bidder makes the purchase he may do so without any recourse.

It is not likely that geldings, unless they are outlaws, would reach an old age before being sold at auction, but there are mares put through these sales that are too old for further use, that do not show their age and are very deceiving. The excuse for not catching these wild mares and giving their correct ages is that there are too many horses to sell in the allotted time. Western mares are being successfully purchased for brood mares to be used on corn belt farms, and the matter of age is important.

A very good method to follow in purchasing range mares is to visit some ranchman whose responsibility is known and as part of the agreement have the owner put these mares in a chute where their teeth can be examined. An aged mare that has never been halter broke, and is very wild, would not be considered a good prospect to purchase. There is a good demand for these Western mares if the buyer knows where to find them and make satisfactory deals.

LIVE STOCK INSURANCE.

Elsewhere in this issue we print a letter from a man of experience in such matters, taking exceptions to our recent editorial on live stock insurance. This is a question that interests all, and we welcome the experiences and observations of all subscribers. Especially would we like to hear from those who have used, or been connected with, mutual live stock insurance, or with any organizations of farmers and stockmen who carry their own insurance, or insure in this manner.

CONTAGIOUS ABORTION.

Reports from the Northwestern states and parts of Western Canada concerning contagious abortion have been received at this office. In some sections it is very bad. For several years this condition has been reported in different sections of the United States. Prevention is the best method with this disease. There are not many farmers who will treat their mares or who realize the seriousness of the condition.

A meeting should be called in a section where this disease is known to exist and have as many horse breeders present as possible. A campaign of education should be started. The mare owners should be taught to watch their mares closely. This disease is difficult to detect, as a rule. The mare may seem "tucked" in the flanks. Immediately after an abortion a little blood may be found on the tail. Mares that have lost their colts with this disease should not be served, as the stallion or jack would then be the means of conveying infection to other mares.

Mare owners should be advised to have their mares treated and the foetus, if discovered, should be burned. When thoroughly established in a community the disease may last for several years. This disease is usually introduced by a strange animal coming from an infected district. Those who have had some experience with the loss which this disease usually brings will realize the importance of preventing its spread.

THE PLACE TO BREED CAVALRY HORSES.

An idea which we have several times advanced in connection with the question of breeding cavalry remounts by the United States government is now being considered by the authorities as the next probable step. This country possesses in our Western horse, or "broncho" stock, material that is unsurpassed for wind, quality of hoof and all round ability to stand hard usage. We also possess throughout a good share of the range country many locations that are ideal for breeding a hardy class of horses just suited for cavalry service. Plainly if the government wants to breed the best class of cavalry horses at the least possible cost it can not afford to fail in making the fullest use of these factors.

Virginia and some other of the older states may possess locations in which the pasture, value of mares and the sentiment are favorable for the production of $150 cavalry mounts, but the Western plains for fifty years has had the toughest riding horses in America and favorable material and conditions are everywhere. It is well, however, that the government has reached the point of recognizing these facts, for a few more years use in parts of the range of jacks and cheap cold blooded grade draft stallions would considerably reduce the number of Western mares suitable for remount production. As it is now there are thousands of good range mares which, mated with such sires as are being used on the government's farm at Fort Royal, Va., or with good cavalry horse sires of much less fame, can produce a race of cavalry horses second to none in the world. They have the quality of hoof and bone, they have the eyes and the wind and the bottom, and the conformation for travel. The old idea of the broncho's natural viciousness is without foundation. The wild life this horse led for generations and the methods employed in breaking individual animals would make any spirited horse vicious. The broncho naturally is perhaps of a better disposition than the thoroughbred. Thousands of them carrying one cross of draft blood, are making excellent work horses on farms of the corn belt, and with careful and gentle management they became safe as any horse, even after having spent their first two or three years on the range. But more important than all else, perhaps, is the ability of the Western horse to "rough it"—to make long marches on scant food and water. For when the cavalry horse is put to the real test of war this is what it will be put "up against." Blue grass pastures and springs and nosebags full of oats will not grow along every line of march.

It is hoped that the governmental departments conducting this work will give the Western horse and Western condition a chance on something the same scale now being employed in the East. At Fort Royal, Va., 35 small farms in the Chester Gap district were bought to make a breeding farm of 5,500 acres. This purchase, and the added equipment, has cost a large sum of money—a sum which undoubtedly could be made, in the West, to produce many more potential horseback miles than will come from the Virginia investment.

AVOIDING DANGER.

A subscriber writes that we have made mention of so many things of a dangerous character that he is afraid horse breeders will be unduly alarmed. He further states that he did not believe there is anything to "infection." He states that he has kept company with all classes of people, under all kinds of conditions, and never was sick a day in his life.

It is not our purpose to frighten any one, but we believe that a preventive is better than a cure. We have made mention of these things and tried to make it plain so that it would not be necessary for breeders to encounter these conditions. Each year the scientific men are discovering that infection has more to do with both human and animal diseases than all other influences combined. Practically every disease is dependent on some particular organism. There are not many individuals who would care to subject their families to any of the dangerous diseases. If disease can be communicated from one human to another, why can it not be transmitted from one animal to another? If it is necessary to quarantine smallpox and similar diseases, why is it not necessary that we try to keep our diseased animals isolated?

There is one evident fact—that where breeders have taken our advice on this subject their stock has remained in a more healthy condition. This is the best evidence that prevention is better than curative measures.

THE APRIL 5 ISSUE.

We announced on several occasions that an article concerning barren mares would be printed in the April 5 issue. About 8,000 copies of that particular issue were printed so that we might supply new subscribers and those who had failed to renew at the proper time. That number has been exhausted and nearly every mail brings requests for that issue. We printed more than we expected to use so as to be sure to have enough to satisfy the wants of all. Most of these complaints are coming from those who failed to renew at the proper time.

We are always glad to send back numbers when we have them, but do not feel justified in printing a great surplus of papers that might not be used.

AMERICAN BREEDER'S SCHOOL (Horse Breeding LESSON V)

Importance of Teeth.

A knowledge of the structure and function of teeth of horses as well as the influence diseased or worn out teeth may have on the fecundity of mares offered for service, we believe to be a vital subject to breeders. Every man engaged in horse raising should become posted on these problems. They properly belong to his particular work and he should make it his business to become informed on all the practical phases of the subject.

Teeth are hard substances implanted in the jaws of horses for the purpose of masticating or grinding the food.

The horse under domestication subsists upon hard grains and coarse forage. In order that the food may be properly prepared for true digestion in the stomach it is quite necessary in animals like the horse that it be well broken into fine particles; in fact, the more completely the food is ground the easier it makes the process of digestion.

In the horse the process of grinding is quite complete for the reason that in that animal the food is not regurgitated for a second mastication, as in the ox and other ruminants.

The horse is provided with 24 strong, deeply implanted molar or back teeth that are chiefly concerned in crushing and preparing the food for digestion. These teeth are made up of three separate substances that vary in degree of density and hardness.

These three substances are arranged and exposed on the grinding surface of the teeth of the horse in a manner so that surface always presents a roughened condition. As the teeth become worn through use the softer structures wear away more rapidly, thus leaving exposed the dense enamel which is arranged in irregular lines over the surface of the teeth. In the act of mastication there is considerable lateral or side movement, which is very effective under the influence of strong muscular action in reducing the hard particles of food to fine proportions. It will be seen that the teeth of the horse would, under years of use, become worn out were it not arranged so that a proportionate part could be pushed out of the socket to replace the wear that necessarily occurs from mastication.

The teeth are of quite uniform shape from crown to fang so that as the tooth is pushed out to replace wear, the exposed portion is not changed in shape.

The molar teeth of the horse may extend from three to four inches into the jaw, and before the death of that animal occurs from old age, say at 25 years, it may not extend into the jaw more than one-half inch. The tooth has during the life of the animal been used up in wear, and as the parts wore away at the grinding surface the tooth is gradually pushed out to replace that which was consumed by wear.

Permanent teeth are structures that when once worn out are not replaced. The same statement applies to the human race. Man has become sufficiently expert, however, so that he supplies himself with teeth of the artificial sort, which have become quite satisfactory, or better, he arrests the process of decay by stopping the cavities caused by decay with metallic substances.

Such operations are not practicable in the horse for the reason that his teeth are not inspected sufficiently often to detect the beginning of decay. Rarely are horses' teeth examined unless that animal presents some symptoms that appeal to the owner as those attending difficult mastication, and when these symptoms have appeared, as a rule, the process of destruction of the tooth has approached that point where extraction is the most rational thing to do.

Again, the molar or grinding teeth are the ones most frequently diseased and being located so deeply in the mouth it is quite impossible to detect and operate upon a cavity on an animal that is difficult to control and restrain, such as is the horse.

Operations of this nature are but little needed upon the more exposed incisor and canine teeth, for the reason that these teeth are rarely diseased.

The wear that takes place on the grinding surface of horses' teeth is governed very mich by the quality and density of those organs. In this particular, teeth vary a great deal. The quality of horses' teeth is rarely considered when making a purchase, although a buyer may be severely critical on soundness and quality of other parts of the body. The fact is, the teeth are one of the least enduring parts of the animal economy. A moment's reflection on the condition of the teeth of the human race will help to make the statement plain. In man, as a rule, the teeth are lost before the three score years and ten are reached, and destructive effects are usually greatly in evidence before he has even passed his teens.

In some horses the teeth are practically worn out at twenty. The animal may be still sound in limb and wind, and yet on account of defective mastication, he goes to the bone yard. Horses that are styled well bred frequently reach the age of 35 years and still preserve the sound teeth of the average eight-year-old.

The quality of teeth could be greatly improved and the longevity and usefulness of the horse kind greatly lengthened would breeders give the same care to the selection of quality in teeth that they now insist on in other parts of the body.

The teeth then are very important organs in the animal economy for as soon as they become lost through the process of wear, the days of that animal are shortly numbered. Breeders should make it a practice of giving this subject closer study and should familiarize themselves, not only with the general structure and quality of teeth, but should be on the lookout for defects, some of which may be corrected by a competent veterinary dentist. To aid in the examination a beginner may need an instrument called a mouth speculum, which is intended to keep the mouth open sufficiently so that the teeth may be inspected and felt with safety. Defective teeth or teeth that have become worn out, have a marked influence on the health or general thrift of an animal. As the vital powers wane through lack of nutrition from the food, all the functions of the body are more or less disturbed. The improperly masticated food finds its way to the stomach, resulting in mischief in the form of colic, indigestion, diarrhoea and so on. If the state of the teeth is not observed and corrected (if correction is possible) these conditions of disturbed digestion incline to become chronic.

The generative organs participate in the trouble and sterility is associated with the state of decline. Breeders should make a very careful study of the unthrifty mare. They should become posted on the subject of age as determined by the condition of the teeth.

Breeders are too frequently guilty of repeatedly breeding a mare that was never known to give birth to a colt. A glance at her teeth would disclose that she had reached a point in advanced years where senile atrophy of the ovaries had long since taken place.

There are several symptoms indicative of worn out or diseased teeth. The chief ones are unthriftiness with dull, lustreless coat; difficulty in masticating, as shown by the animal turning its head to one side while eating, slobbering, quidding the food, feeding slowly, improperly digested food, as shown by whole grain escaping with the faeces, attacks of colic due to the irritating influence of the improperly masticated food, and so on.

To learn the exact cause of any of these symptoms is not difficult as the molar teeth may be easily inspected and their condition determined by inserting the hand into the mouth and palpating along the course of the rows of teeth. As has been stated such examinations can be more satisfactorily done by using a special instrument called a mouth speculum, which holds the mouth open.

One can nearly always draw a conclusion as to which side of the lines of teeth are faulty by noting the behavior of the animal while eating. In this particular a horse chews quite similar to man.

The lower jaw is dropped and swinging to one side through the action of certain muscles, is then closed against the upper and the act of crushing the food takes place as the lower jaw is brought back again toward the median line. A little practice in observing a horse while eating will quickly teach the observer which side is being used at that time for mastication.

The teeth are very important structures in an animal's makeup, and breeders should become more familiar with their structure and function. They are the chief parts that are made use of in determining the ages of horses and are quite reliable guides.

Every breeder should become familiar with the age problem as determined by the appearance of the teeth, and we may have something to say on this point in some future issue.

Having read carefully through this lesson, one or more times, the student should now ask himself the following questions and find the answers thereto in the preceding lesson:

1—Which class of the teeth of a horse is most likely to cause trouble?
2—How do teeth cause trouble?
3—How might defective teeth affect a mare's fecundity?
4—What would first cause you to make an examination of the teeth of a mare?
5—Is it advisable to have the teeth examined occasionally without waiting for trouble?
6—In what way is tooth quality in a horse comparable in importance with hoof quality or good eyes?
7—What is the value of an animal (otherwise sound) after its teeth no longer do their part?
8—What provision is made by nature for replacing the constant wearing of a horse's teeth?
9—What defect, besides decay, might occur at the grinding surface of a tooth?
10—How many grinding teeth has a horse?

WORKING DRAFT STALLIONS.

Do you think that farm work will hurt a big draft stallion if well cared for? Won't it help his breeding qualities? I think that idleness breeds vice and if you do not give them something to do they will form vicious habits. I work my horses. Let us hear what some one has to say on that subject.—Ohio Subscriber.

MODERN HORSE BREEDING.

There are four of the most scientific men in the country who are annually employed by an institution recognized by the government that are making many horse breeding investigations. These experts have every known means for carrying on scientific experiments. They are each specialists on special lines in animal production. Their special lectures have never appeared in print; neither is it likely that they will ever be given to the public. It has cost them years of time and money to prepare this special information.

These are only four of the instructors who lecture and demonstrate at the Graham Scientific Breeding School. Those who have studied the lessons in the American Breeder have only received a taste of the real scientific problems. Breeders can realize how much real value this instruction would be to them if they put in an entire week on this particular subject, beginning each morning at 7:30 and continuing through the entire day until 10:30 at night. This school gives a practical course. Each student is required to perform actual work. Infected mares are dissected, showing the genital tract in a diseased condition. The ovaries are examined. Each student must make all of these examinations, including the rectal examination. He is taught the location of every organ pertaining to horse breeding.

The dissecting and similar work is done in a specially prepared hospital. Then the school is taken to the stock yards where about 50 head of barren mares are examined, which gives a good opportunity to find all kinds of mares. By having these live animals on which to work gives the student an opportunity to learn which mares are not to be served by natural service, and what to do with the diseased mares. The diagnosing of barren mares at this school is worth the time and expense without any other instruction. In fact, a price can not be placed on its real value.

By attending the August term (11 to 16) breeders will have an opportunity to make the fall season and put this work into practice, which will not only give them the necessary experience and prepare them for the next spring season, but a lot of mares can be settled in the fall so they will not be in the road during the busy spring season.

The expense of attending this institution is not very great. It will only take a few colts to pay for it, which should be easily obtained this fall. The breeder can use this information in his life work. It is remarkable to hear those who attend say that they have been able to see lots of things on their mares after they go home that they had never seen before.

This is the only school of its kind in the world, yet it has been patronized from nearly every section of the United States where horses are bred and several foreign countries. One comes in contact with many of the leading breeders here; different experiences can be exchanged and the association with one of these classes will never be forgotten.

The school is conducted in a moral and up-lifting manner. Fathers and mothers need not fear to have their sons attend this institution. "Booze," profane or vulgar language is prohibited. Any one attending this institution must comply with the rules or he will be asked to retire.

There are no agents. Every new student that attends must pay $25, which entitles him to a life membership. The tuition fee may be advanced for the December term. This depends on the attendance at the Au-

BEFORE YOU GO TO A
Business College

I want to talk to you either personally or by letter. I want to tell you what I will do for you. I want to tell you something of the aims, aspirations and ideals of my institution, and the work I am doing for **better business training.** I want to tell you how I will help you. No matter where you live—no matter what your financial condition. If you are earnest, ambitious, honest and really want to learn **Shorthand, Typewriting, Bookkeeping, Penmanship, Salesmanship** or other **Commercial Branches,** write me today for my **new catalog** and let me tell you how I can help you realize your ambitions on terms to suit yourself. Students assisted to a place to work outside of school hours for room and board. Address me personally. **C. W. RANSOM, Pres.**

RANSOMERIAN BUSINESS SCHOOL,
911 Minor Bldg., 10th and McGee,
Kansas City, Mo.

SHORTHAND IN 30 DAYS

We absolutely guarantee to teach shorthand complete in only thirty days. You can learn in spare time in your own home, no matter where you live. No need to spend months as with old systems. **Boyd's Syllable System** is easy to learn—easy to write—easy to read. Simple. Practical. Speedy. Sure. No ruled lines—no positions—no shading, as in other systems. No long list of word signs to confuse. ONLY NINE CHARACTERS to learn and you have the entire English (or any other) language at your ABSOLUTE COMMAND. The best system for stenographers, private secretaries, newspaper reporters, lawyers, ministers, teachers, physicians, literary folk and business men may now learn shorthand for their own use. Does not take continual daily practice as with other systems. Our graduates hold high-grade positions everywhere. Send to-day for booklets, testimonials, guarantee offer, etc.

CHICAGO CORRESPONDENCE SCHOOLS
1017 Chicago Opera House Block, Chicago, Ill.

The James Milliken University

A Christian College, offering full Classical and Technical Courses. Seven fine new buildings, including ladies' dormitory, all with modern equipment. Co-educational. Superior Faculty. Expenses Low. Over 1000 students last year. For catalog, address,

gust term. It is the intention of the management to collect only enough tuition to pay the running expenses.

Any one who doubts the value of this school should visit one of the students. There is now a large army of these men who will testify to the value of this institution, not in words alone but in actual results.

There will only be two terms of school this year. The next one will be August 11 to 16; the other one will be held in December.—Advertisement.

SAMPLE KANSAS CAPSULE COLTS—Col. J. H. Moormann of Saline County, Kas., writes that the Capsule System is gaining every day "in these diggins" and encloses the above photos.

Serum-only treatment does not give permanent protection against hog cholera. Serum alone should not usually be used in healthy, unexposed herds because the protection given is too short to be practical, but is very useful in recently infected herds wher it usually gives fairly permanent protection.—Dr. M. H. Reynolds, Minnesota University Farm.

Good Live Stock Movement

All Markets But Sheep Well Sustained in Face of Larger Supplies. Cattle Fluctuate Around a Good Level. Hogs Reach $9 Again.

Trade in horses and mules the last two weeks in June was better than in the first two weeks. Dealers had not expected much demand and supplies were low. However, requirements were more than equal to the supply. Among shipments were some big horses for the east and some good sized mules for the South. The harvest sections were after all purpose work horses, and some mules. The general demand was small compared with early May, and March, but still it was above normal for this season of the year. Dealers say that for the next month demand will be of a scattering character, mostly of the fill-in sort. Few horses are available in the country for shipping, and farmers have not rounded up their work enough to begin to cut down their work supply. Early September will probably find a good many horses thin, and available for feeders. Last year proved a success along this line, and with cattle scarce and high in price, feeding horses should be easy to sell.

The character of the market in July has always been uncertain. In some previous years there has been a good demand for heavy mules for construction work, and heavy drafters for city work. Extreme heat generally causes some demand as the death rate under such circumstances is high and the average work power of an animal is lowered. In the past month however, with a good many hot days, deaths among city horses have not been unusually large. The high prices that have existed for horses in the past two years have developed a humane feeling for the horse, and his treatment now, in cities especially, is far better than when the animal was worth less. This has added greatly to the general value of both horses and mules.

It would be hard to quote a definite price range for the various grades at the present. Not enough horses are selling in any one class to fairly test a price range, and most quotations are of a nominal character. A smooth, well rounded, good drafter in tip top shape would bring as much as any time this year. Some with less quality, and deficient in weight, would bring about $15 under the high time in May, and for the common kinds prices have shown turns both above and below two weeks ago. Good mares would sell readily, but practically none have been offered that attracted breeders. A load of light weight mares was sent to Texas last week, and the buyer intends to raise mules next year. Most mule men prefer a large mare as a jack cannot always get size.

General conditions favor a good fall trade in mules. The South has another crop of cotton well started, which promises to be as large as 1912, the second largest on record. They are adopting up-to-date methods in farming also, and the entire tendency is to require more soil cultivation. The mule is the favorite work animal for the South, and will continue so, as he stands the heat better. Heavier mules are required now than a decade ago, and instead of the cotton mule being small, some go south that are over 16 hands high.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Draft, choice, 1600 lbs. up	$230@275
Drafters, fair to good	150@225
Chunks, good to choice	125@165
Chunks, fair to good	100@125
Expressers and light draft	60@120
Plain workers	40@ 85
Southerns, good	125@150
Southerns, plain to fair	65@120
Plugs	20@ 55
Mules—	
13 to 14 hands	$ 75@120
14 to 15 1-2 hands	110@150
15 1-2 to 16 hands	140@185
16 to 16 1-2 hands	190@285

Fat Cattle Prices Fluctuating.

About ten days ago prices for prime fat steers were as high as any previous time this year. River markets reported tops up to $9, and Chicago sales ranged up to $9.20. Since then the market has weakened about 15@25 cents on the choice grades and 35@50 cents has been taken from the plainer kinds. The supply of corn fat steers is diminishing, and the movement of grassers and short fed steers is increasing. In the past two weeks the new offerings were steers that had been fed grain on grass. They sold at $8.25@8.75. Most of them came from Missouri. Texas sent in a good many steers that had been fed cotton seed cake on grass. Those offered on the quarantine side sold at $7.50@8.20, and on the native side as high as $8.35. Monday nearly 6,000 cattle arrived in Kansas City from be-

THE KANSAS CITY VETERINARY COLLEGE

Gives a Thorough and Complete Course. Conforms to the Requirements of the Bureau of Animal Industry.

New Buildings, Commodious Hospital Equipment, Experienced Instructors, Large Attendance, One Acre and a Half of Floor Space.

Dr. S. Stewart, Secretary,

1336A East Fifteenth Street, - - - - - - - - - Kansas City, Missouri

low the quarantine line. The top price paid for steers was $7.85, and some grass steers brought as low as $5. The increase in the supply of plain steers from below the quarantine line is one factor that weakened prices for plain to fair steers on the native side. There have been times within the past two weeks when some sections in central western states were on the verge of a big dry weather movement of cattle. Such sections have been relieved, temporarily at least, by showers, and in some places good rains have fallen. At the present time the early run of grass cattle is about due, though if pastures continue good that movement will not amount to much before August. The scarcity of good corn fat cattle is growing more pronounced, and thick fleshed steers are promised a good demand in August to October. In the past ten days weight has been regarded more favorably by killers, and the big run of baby beef has been marketed for this year. Yearling steers sold up to $8.90, and mixed grades made that price also. Heavy steers sold up to $9@9.20. Packers will have a chance to equalize cost by substituting plainer beeves on the final disposition, the cost of prime beef determining the general selling price.

CORN HARVESTER with Binder Attachment cuts and throws in piles on harvester or winrow. Man and horse cuts and shocks equal with a corn Binder. Sold in every state. Price $20.00. W. H. BUXTON, of Johnstown, Ohio, writes: "The Harvester has proven all you claim for it; the Harvester saved me over $25.00 in labor last year's corn cutting. I cut over 500 shocks; will make 4 bushels corn to a shock." Testimonials and catalog free, showing pictures of harvester. Address **NEW PROCESS MFG. CO., SALINA, KAS.**

AUTO-FEDAN
(Self Feeding Hay Press.)
MEANS ONE LESS MAN.

Two men can operate this machine. Bale as much as 3 will with any other. Can furnish with 12-horse engine mounted on same frame, direct gear drive, weight only 4,000 lbs. The most compact and nicest machine there is out. Write for catalogue.

The American Farm Gate Co.
1457 Elmwood Ave. Kansas City, Mo.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$8.65@8.75
Good to choice steers	8.10@8.60
Fair to good steers	7.65@8.05
Common to fair steers	6.00@7.60
Meal fed, choice	7.50@8.15
Meal fed, common to fair	6.75@7.40

Last of Dry Lot Butcher Cattle.

Practically all of the heifers, mixed grades and yearlings that will reach markets this summer out of dry lots, have been marketed. A few good ones will be available all along, but they will show more or less greenness. At present it is an $8@8.75 for the full fed baby beef, but the kinds that lack finish are falling below 8 cents and common kinds under $6.50. At $6.50 and under killers are excluded, as country buyers out bid them. The top price this past week for heifers was $8.75, and bulk $7.50@8.50. Prices will fall rapidly when the market is adjusted to the basis of grass fat. Cows are 15@25 cents lower than two weeks ago, except some that have been full fed. They are steady. The range in prices is $3.75@7.25. Veal calves have suffered some depreciation though in the past few days the loss was regained.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$6.50@7.25
Fair to good	5.25@6.45
Common to fair	4.25@5.20
Canners	3.65@4.20
Heifers—	
Choice fed	8.00@8.75
Good to choice	7.40@7.90
Plain to fair	6.50@7.35
Common	5.25@6.45
Veal calves	6.00@9.50
Bulls	4.00@7.25

Quick Turns in Stocker Prices.

The third week last month dry weather in various sections began to assume a serious aspect. Some cattle were moved owing to the lack of water, and their appearance on the market tended to make the trade nervous. Prices were depressed 50@75 cents a hundred pounds. Last week there were no such cattle on the market, and prices bounded up as rapidly as they declined and now, quality considered, stockers and feeders are selling at nearly the high level of the year. Some fancy 1,200-pound black steers sold to an Illinois feeder at $8.65, which was 5 cents more than killers bid. The top price for regulation feeders was $8.10, and stockers sold as high as $7.85. Demand for stock cows, heifers and calves is active.

The following quotations are for stock and feeding cattle:

Selected feeders	$7.50@8.10
Good to choice feeders	7.50@7.70
Plain to fair feeders	6.85@7.45
Selected stockers	7.40@7.90
Good to choice stockers	6.85@7.35
Plain to fair stockers	6.35@6.80
Stock calves	6.00@8.00
Stock cows	4.50@6.00
Stock heifers	5.25@6.85
Milch cows	35.00@90.00

June Hog Market Closes High.

In the first two weeks in June hog prices fluctuated 25@30 cents. In the third week the price movement was less extreme, and in the final week prices varied but 10@20 cents and were the highest of the month. The top price in June was $8.80, in Kansas City, and $9.05 in Chicago, compared with $8.77½ and $8.85 in May. The last week of the month showed the highest average prices of the past two months and more. Many traders believe that the market is in for a general advance, because June prices were higher than May prices and June receipts this year were considerably larger than in June, 1912. However, the trade did not expect such a liberal June run, and had not shipping demand been unusually large packers would have put prices below $8. The quality of the hogs coming now is good. Practically no sickness is showing among the offerings, and few complaints are being received from the country. A year ago at this time a large number of young pigs were thrown on the market on account of cholera.

The following table shows prices for hogs in Kansas City in the past two weeks:

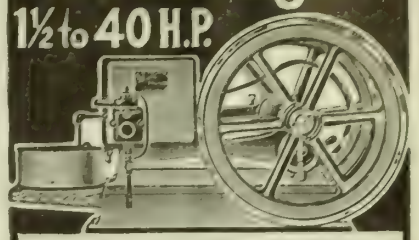
Mon., June 23	$8.60@8.75	$8.65@8.80
Tuesday	8.69@8.77½	8.50@8.65
Wednesday	8.60@8.75	8.40@8.60
Thursday	8.65@8.80	8.45@8.60
Friday	8.60@8.80	8.45@8.72½
Saturday	8.55@8.65	8.50@8.70
Mon., June 30	8.60@8.70	

The following quotations are for hogs:

Choice, 250@300 lbs	$8.65@8.72½
Choice, 200@245 lbs	8.65@8.77½
Medium weight	8.70@8.77½
Light weight	8.35@8.77½
Common to fair	7.75@8.60
Stags	7.00@8.60
Boars	4.50@6.75
Bulk of Sales	8.65@8.75

Sheep Prices Down to Low Levels.

Early last week sheep prices bounded up 40@65 cents, but Friday and in the first two days this week, that advance was eliminated and the market fell to the low level of the season. Packers have been buying spring lambs freely at Southern markets and on Friday and Saturday about 24,000 were consigned direct to them in Chicago. This has tended to reduce demand at the Western markets. Spring lambs are quoted at $6.75@7.50, and sheep $4@5. Some range sheep have been received at Western markets, but that movement thus far has been of little consequence. The latter part of July a good many stock and feeding sheep will be available, and by the latter part of August the run will be in full blast. Prices will depend to a large extent on crop conditions.



The Live Stock Movement.

June receipts of live stock were much larger than were expected a month ago. June was the first month this year when combined receipts of cattle, hogs and sheep at the five Western markets showed increases. Hogs increased more than 100,000, cattle about 50,000, and sheep about 70,000. The combined receipts of cattle at the five Western markets last month were 538,400, hogs 1,523,900, sheep 780,000, compared with 486,000, cattle, 1,394,800 hogs and 709,625 sheep in June, 1912. For the six months this year combined receipts still show a decrease. The total was 3,275,000 cattle, 8,752,600 hogs, 4,991,100 sheep, compared with 3,329,300 cattle, 9,872,400 hogs, and 5,178,000 sheep in the first six months of 1912.

A SYSTEMATIC HOG CHOLERA FIGHT.

Under a special appropriation of $75,000 made by Congress "for demonstrating the best method of prevent-

WITTE Engines
1½ to 40 H.P.

Cost Less!—Worth More!

Here's my new offer, **direct** from my factory to power users everywhere. **No dealer's profits.** Think of it! The **highest** standard engines for the **lowest** prices. Nobody else has these two things to offer together.

DEPENDABLE POWER
From Gasoline, Gas or Oil

WITTE engines have set the quality standard for 26 years. Better today than ever. 1½ to 40 H. P. stationary and portable sizes. All have detachable cylinders, vertical valves, four ring pistons, electric ignition and other exclusive merits, without which no engine can now be high-grade.

Start Without Cranking

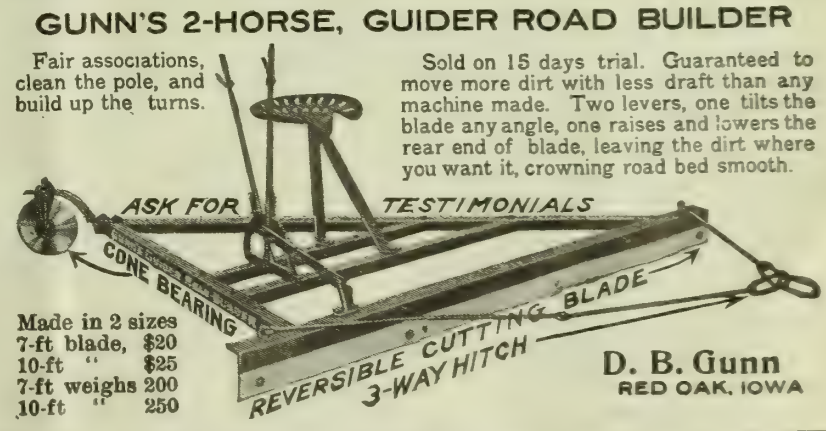
The **WITTE** had that advantage 20 years ago. You don't even have to press a button. Don't be satisfied with any out-of-date engine. Don't risk any untried, new fangled devices with high-falutin' names. Be safe and sure. Let me show you

How To Judge Engines

My new book shows the secrets. All made plain as A. B. C. It gives my 5-year guarantee and 60-day free trial plan. Tells you how to be safe in your engine selection, even if you don't pick a WITTE. It took me 26 years to write it, but you can get it quick—just send me your name—no money—and it will come by return mail.

ED. H. WITTE, WITTE IRON WORKS CO. 2555 OAKLAND AVE., KANSAS CITY, MISSOURI.

FREE BARGAIN BULLETIN
A NEW ONE EVERY MONTH



Before you build get our prices. Smashing reductions in **LUMBER**; 3,000,000 feet—new and used. Every grade and dimension. Write today and we will send you free regular monthly list showing everything—doors, windows, roofing, paint, hardware, etc. 500 items.

HOUSEWRECKING SALVAGE & LUMBER CO., 1735 TROOST, KANSAS CITY, MO.

GUNN'S 2-HORSE, GUIDER ROAD BUILDER

Fair associations, clean the pole, and build up the turns.

Sold on 15 days trial. Guaranteed to move more dirt with less draft than any machine made. Two levers, one tilts the blade any angle, one raises and lowers the rear end of blade, leaving the dirt where you want it, crowning road bed smooth.

Made in 2 sizes
7-ft blade, $20
10-ft " $25
7-ft weighs 200
10-ft " 250

D. B. Gunn
RED OAK, IOWA

KEROSENE, GASOLINE AND OIL
To Consumers at Wholesale Prices
NO WATER IN MY KEROSENE OR GASOLINE.

XXX 46 gravity water white kerosene	$6.00 for 52 gal. bbl.
XX 42 gravity kerosene (the kind usually sold)	$5.25 for 52 gal. bbl.
XXX 64 gravity gasoline	$10.00 for 52 gal. bbl.
1 case graphite axle grease (2 doz. 3 pound pails)	$3.50
40 gravity prime white stove distillate	$4.50 for 52 gal. bbl.
83 gravity stove distillate	$4.25 for 52 gal. bbl.
60 gallon (26 gauge) galvanized steel tank with pump and hood cover complete—a great convenience in every home.	$3.60
Extra heavy pure crude oil, steamed and settled (black oil) good lubricant, just the thing for greasing tools	$4.00 for 52 gal. bbl.

I will pay $1.25 each for my crude oil barrels, and $1.50 each for refined oil barrels, returned to me at Coffeyville, Kas., in good order, less freight charges on same.

C. A. STANNARD, Box A, EMPORIA, KANSAS

Alfalfa As a Money Maker

Rich alluvial soil is what is wanted for the successful growing of Alfalfa, the king of forage crops. The Red River Valley has this kind of soil in abundance—nothing better anywhere. We can recommend this land to well-to-do farmers who want something really good. Ample rainfall.

A Crop Every Year

Write for free booklets and magazines to the Kansas City Southern Ry., Wm. Nicholson, Immigration Agent, 671 Thayer Building, Kansas City, Mo.

Irrigated Farm Land

With Abundant Water Supply.

Grazing Land (Watered) and Timber for sale in Southwest Colorado. Irrigation facilities here are unexcelled and this has long been Colorado's best live stock section.

Fine, moderate climate; no extremes; tornadoes unknown.

155 acres fine private water right. 2½ miles from Mancos; 30 acres in meadow, timothy and red top. Alfalfa, meadow, grain land, small orchard. Good six room house just been remodeled. Hay barn 40x56. Horse barn, cow sheds, chicken house, shop, granary, ice house, etc. Good fence; $55 per acre; a bargain.

160 acres; good house; barn, cross fences; chicken house; sheds, etc.; four shares in storage system besides fishing in waste water. Four acres in cultivation. New farm; fine land; four acres in orchard; $5,000.

160 acres four miles from town; good small house; barn; fenced; partly under cultivation; fine land; $2,000.

Raw land, agricultural and grazing at $5.00 per acre.

W. L. Morse, Mancos, Colorado.

CATTLEMEN.

British Columbia bunch grass range land. We can locate you on Government land, 21 year lease with option to purchase. Have several ranges with cattle for sale. **The Wright Investment Co., Ltd., 1110 Dominion Bldg., Vancouver, B. C.**

ing and eradicating hog cholera," the United States Department of Agriculture has undertaken practical experiments in combating this disease. The appropriation becomes available July 1, and work will be begun first in Dallas County, Iowa, and will be taken up later in Indiana, and in one or two other states. In Iowa the work will be done in co-operation with the state veterinarian and the Iowa State College.

A few years ago the Bureau of Animal Industry of the Department of Agriculture, after years of experimentation, developed a serum which has been demonstrated by repeated tests to be very effective in preventing hog cholera. In many states this serum has been prepared and distributed to farmers with the result that large sums of money have been saved to the farmers, but thus far no systematic effort has been made to eradicate hog cholera. In the work which is now begun the control and eradication of the disease will be the main object, the serum being used in connection with the necessary quarantine and educational measures.

HOW MUCH SHOULD THE SILO HOLD?

To the American Breeder: — The amount of silage required and the size of silo needed to hold it can be quite closely caluculated provided the number and kind of animals to be fed from it are known before building.

An average cow or beef animal may be fed about thirty-five pounds of silage per day and the usual period during which silage is used in this latitude will be about 210 days. Large animals or those that are being fattened may consume considerably more than thirty-five pounds per day but this has been found a fair average.

In a silo of ordinary depth, the average weight of the silage is about forty pounds per cubic foot. Near the top of the silo, however, where the pressure is not great, it will weigh only twenty-five pounds per cubic foot, while at the bottom of a thirty-five foot silo it may weigh sixty pounds. Taking these averages, if a cow eats thirty-five pounds of ensilage in a day, she will eat thirty-five fortieths, or seven-eights, of a cubic foot per day and with this as a basis it is easy to determine the number of cubic feet of ensilage required to feed a cow or any number of cows throughout the season. The diameter of the silo must be such that the stock on hand can use one or two inches of silage off the top each day during the winter and at least three inches per day when summer feeding of silage is to be practiced. This is necessary to keep the silage from spoiling.

A silo ten feet in diameter is adapted to feeding ten mature cattle. One twelve feet in diameter will feed fifteen head, and one fourteen feet in diameter will meet the needs of twenty head; but if there are thirty or more cows to feed, a sixteen-foot silo should be erected. These silos should be thirty or forty feet, or even more in height.—A. D. Wilson, Superintendent, Extension Division, University Farm, Minn.

HEREFORDS FROM MISSOURI TO MONTANA.

A shipment of Hereford cattle from the herds of James McKitterick, J. P. Cudahy and Noah Lentz, all near Kansas City, left the other day for Pleasant Valley, Mont. It consisted of high class registered breeding cattle, and was collected by K. Godfrey, formerly well known among Hereford cattle breeders of Kansas City territory. Mr. Godfrey is employed by the Pleasant Valley Land & Cattle Co., for whom he made the purchase.

"In the last few years," Mr. Godfrey says, "northwest Montana has established a number of new herds, among them the A. P. Cook herd at Helena, Conrad Koler's herd at Deer Lodge and the H. McNamara and Marlow herds. Last October H. McNamara bought the entire Meadow Park herd of C. W. Armour, at Kansas City."

RABIES IN CATTLE.

To the American Breeder: Veterinarians are very frequently asked as to the danger from milk, blood or saliva of rabid cattle. The experience and observations of many authorities indicate that there is slight, or almost no risk from milk consumed in the ordinary way. It is conceivable that milk from a rabid cow might produce rabies in case of a distinct injury or abrasion of the mucous membrane lining the mouth, stomach, or intestines. It might be possible, also, for such milk to prove dangerous to very young infants, on the theory that the mucous membrane lining the digestive tract of the infant is less resistant to germ infection than in case of older people.

Actual experience shows, however, that such infections, either from milk in connection with an abraded mucous membrane or when given young infants, must be exceedingly rare.

It has been shown by experiments that dogs may be fed the brain of a rabid dog, or milk from a rabid cow without harm; but if broken glass, for example, be mixed with the feed so as to scratch the lining membrane, then rabies may be produced in the dog by such feeding of either brain or milk. Sanitation officers are quite generally agreed in the view that the danger from consumption of milk is not of much practical importance. It happens occasionally that people use milk from a cow that is developing rabies before they know what is wrong with her. Of course, no one would use milk from a cow that was evidently rabid.

Experiments have shown that the danger from virulent blood is exceedingly variable. If thoroughly dried for two or three days it loses virulence to such an extent that it is probably not dangerous. However, if blood or brain substance in any considerable quantity remains frozen it will retain virulence for a long time. It is found that such material does not retain dangerous virulence at room temperature more than two or three days after it has been thoroughly dried.

There is ordinarily little or no danger from saliva around the cow yard or straw pile, because the virus is destroyed by the sun or dried by the wind, and because the chance of infection by innoculation is so slight.

Saliva may become virulent from four to ten days before the animal shows symptoms.—M. H. Reynolds, Veterinarian, University Farm, Minnesota.

TWO GOOD NEW FORAGE PLANTS.

Hay and forage production has been greatly increased by the importation and adaptation of several plants, the cultivation of which has been experimented with and fostered by the U. S. Department of Agriculture through its Bureau of Plant Industry until their suitability and reliability for the desired purpose have been fully demonstrated and their cultivation established.

Two of these are treated in two pamphlets issued in May, entitled "Sudan Grass, A New Drought Resistant Hay Plant" (B. P. I. Circular 125), and "Vetch Growing in the South Atlantic States" (Farmers' Bulletin 529).

In the semi-arid West, where no perennial grass has thus far been found suited to the conditions, Sudan grass promises high value for hay. Indeed, it is not too much to predict that there it is destined to become the leading grass for hay production. Under more humid conditions it has also succeeded admirably and will probably replace foxtail millets to a large extent, as it produces better hay and usually larger yields.

There is still much to learn in regard to the crop, but it has been tested most carefully in Texas, as well as at Arlington Farm, Va., and has had at least a year's trial at many places on the Great Plains and at various agricultural experiment stations, and the data at hand indicate approximately the best methods of culture.

Under light rainfall conditions, it is probably best to sow Sudan grass in rows, yet excellent results have been secured in dry regions from broadcasting, and the grass grown that way does not become too coarse for palatable hay. Although very similar in appearance to Johnson grass, it is considered far superior as a forage crop, as it is more bunchy, putting out more stems and many more leaves. Horses and cows eat it greedily, none of the stems, which contain a great deal of sugar, being wasted, as is often the case with the coarser grasses.

While the above is true as to conditions in the semi-arid section as to the benefit to be secured from this new grass introduced from Africa, the Southeast has also been supplied with a particularly satisfactory forage plant for its humid climate in the vetch. The Southeast is not a grass country, but vetch is grown on practically every type of soil in North Carolina, South Carolina and Georgia, and should come to occupy an important place in the agriculture of these states. It has a high protein content, is a good hay, pasture, and soiling crop, and its more general growth will aid in the development of the live stock industry, which bids fair to be of big agricultural interest at no distant date.

Like all legumes, vetch improves land, and as it grows through the winter and spring it makes an ideal cover crop to prevent leaching and washing, and may be harvested in time to plant corn, cowpeas, or sometimes cotton on the same land.

Of the three kinds of vetch cultivated in the South Atlantic States, hairy vetch, or sand vetch, has a much wider adaptability, and is for general purposes superior to either the narrow leaved vetch, or common vetch, although the latter is earlier, more easily handled, and less expensive to seed.

On land that has never grown vetch, it must, like all legumes, be given the nitrogen gathering bacteria, which appropriate the nitrogen from the air, before a satisfactory growth can be made, and this can be done by use of artificial vetch culture, distributed by the U. S. Department of Agriculture, or by using soil from a field where vetch has recently grown thriftily, and the latter method is more uniformly successful.

The experience of farmers shows that all kinds of stock will eat vetch, that by proper inoculation and seeding it can be grown successfully on all ordinary soils in the South Atlantic States, and that a yield of from 1 to 3 tons per acre is common.

OKLAHOMA FIRM HAS BOUGHT 21,000 GULF STATE CATTLE.

Shipping cattle from Florida and other Southern states to Oklahoma and Kansas, to be fattened there for market is the latest abnormal development growing out of the high prices of live stock. The West is supposed to be the great surplus live stock area. Much meat made from Western

CATTLE.

GOOD SHORTHORNS.

Practical cattle for both beef and milk. Just the kind the farms of the country need, and with breeding and conformation to make show cattle if you want them. I show my breeding stock successfully, but no stock is ever crowded enough to hurt it.

Pleased to show stock, quote prices and answer inquiries at all times.

C. H. White, Burlington, Kas.

JOHN R. TOMSON, Dover Ks.

My herd of Shorthorns is now at the home farm. Gallant Knight's Heir in service. Several good, strong, fleshy bulls ready for service now. Scotch and Scotch-topped.

GOOD SHORTHORNS

Reds and Roans.

1 car load of bulls for sale.

1 car load of heifers for sale.

These are rugged, blocky, good feeders—the kind the country needs.

H. C. Lookabaugh, Watonga, Okla.

SCOTCH SHORTHORN BULLS.

For sale; reds and roans. Baron Douglas 372812 is an extra good, 17 months, low down, red. Also have some good Scotch topped. **L. C. SHEPARD, IRWIN, IOWA.**

HEREFORD BULLS

for sale. Two registered Hereford bulls, 14 and 15 months old. Also pure bred Poland China pigs. Address,

JOHN W. CAROLAN, BOONEVILLE, ARK., ROUTE 3.

HOGS.

PURE BRED DUROCS.

Pigs four months old; eligible to register. Excellent blood lines; pedigrees furnished, tracing to some of the most noted hogs of the breed. **J. W. CAMPBELL, FAIRPOINT, OHIO.**

PURE BRED MULE FOOT HOGS

for sale. Spring pigs of both sex. Price $15 and $25 apiece.

H. WARREN, BROWNSBURG, HENDRICKS COUNTY, IND.

I. O. C. BOARS

ready for service at $25 while they last. Eligible to register. **WM. H. REID, OHIO CITY, OHIO, R. R. 3.**

POULTRY.

FOR SALE.

Full blood partridge Wyandotte hens and cockerels. Have young ones that I will price right. Also one big Poland boar, 1 year old. **W. F. BURNETT, VERGENNES, ILL.**

animals is shipped South so that the movement of Southern cattle to the West is a reverse movement of trade.

Miller Brothers, owners of the 101 Ranch at Bliss, Okla., have been buying many thousand Southern cattle to be fattened on their ranch and elsewhere.

Since March 1 they have bought 21,000 cattle in Arkansas, Louisiana, Mississippi, Georgia and the lower peninsula of Florida. Their buyers visit the South, bid a round sum for a whole herd of cattle and ship them West. Most of them are poor, small animals from herds that have received no new blood for years. In the lower peninsula of Florida the worst conditions prevailed.

CARE OF GROWING POULTRY.

To the American Breeder:—Poultry raisers should not fall into the all too common habit of thinking that after a chick is past the first three weeks, it will raise itself. If a chick is to develop into a healthy, vigorous cockrel, or a strong, active pullet that will shell out the eggs next winter, it must have the best of feed and care throughout the entire growing period.

Do not over crowd. Many of the ills and much of the mortality among growing chicks is due to over crowding. The brooder or coop should furnish ample room for the little fellows to stretch themselves out at night without coming in contact with each other. Plenty of fresh air should be admitted at all times in such a way that there will be no draughts causing the chicks to huddle together.

Fighting lice and mites. Like the poor, these little pests are always with us, and a continual warfare must be waged to keep them from exacting a heavy toll of dead, dwarfed and stunted chicks. Watch for head lice. Greasing lightly the heads of all chicks over two weeks old with a mixture of kerosene and lard, equal parts, will serve either as a preventive or cure. Also grease lightly under the wings. Be careful not to use too much grease and oil. Application should be repeated in about two weeks if chicks are badly infested. For mites paint or spray brooding quarters with a mixture of eight parts kerosene to one part crude carbolic acid. This will also serve as a good disinfectant.

Provide pure water. The importance of an abundance of fresh, cool, pure water, cannot be over-estimated. Filthy drinking water is one of the most common causes of disease, and lack of water a too common cause of unsatisfactory growth. All drinking vessels should be scalded at least once a week. In cool, damp weather sufficient permanganato of potassium to give the water a deep reddish tinge will assist in preventing cold and bowel trouble.

Good feed and plenty of it, easily accessible at all times, is one of the most important "secrets" of successfully producing the best birds, either for market, laying, or exhibition and breeding purposes. After chicks are six weeks old, if they are on free range, they should have free access to a hopper containing equal parts by weight of cracked corn and cracked wheat. If they are confined to runs in which there is no green feed, they should be given, daily, lettuce, sprouted oats or lawn clippings. The grain mixture above mentioned should be sifted and fed in a deep litter of cut clover or alfalfa, or chaff from a barn mow, or finely cut straw, so as to induce plenty of exercise. Plenty of clean, sharp grit should be provided, and a hopper containing the following mixture kept before them at all times (proportions given by measure: 8 parts bran, 4 parts corn meal, 4 parts shorts or middlings, 2 parts fine meat scraps, 1 part fine charcoal. —T. E. Quisenberry, Missouri Poultry Experiment Station.

FAIRS AND EXPOSITIONS FOR THE COMIMG SEASON

State and District Fairs and Expositions.

Alabama—Birmingham, October 9-18, S. H. Fowlkes, acting secretary.

Arkansas—Hot Springs, October 27-November 1, George R. Belding, secretary.

California — Sacramento, September 13-20, J. L. McCarthy, secretary.

Colorado—Pueblo, September 15-20, A. L. Price, secretary, 220 Central Block.

Connecticut—Hartford, September 1-5, H. A. Walker, secretary.

Georgia—Macon, October 21-31, Harry C. Robert, secretary.

Illinois—Springfield, October 3-11, J. K. Dickirson, secretary.

Indiana—Indianapolis, September 8-12, Charles Downing, secretary.

Iowa—Des Moines, August 20-28, A. R. Corey, secretary.

Kansas—Hutchinson, September 13-20, A. L. Sponsler, secretary.

Kansas Fair Association—Topeka, September 8-12, H. L. Cook, secretary.

Kentucky—Louisville, September 15-20, J. L. Dent, secretary.

Louisiana—Shreveport, November 5-12, Louis N. Brueggerhoff, secretary.

Spokane Inter-State Fair—Spokane, Wash., September 15-21, Robert H. Cosgrove, secretary, 503 Chamber of Commerce Bldg.

Tri-State Fair—Memphis, Tenn., September 22-27, Frank D. Fuller, secretary, P. O. Box 1011.

ABOUT OUR 2,740 FAIRS.

The Secretary of Agriculture has recently issued a bulletin containing a list of 2,740 fairs and exhibitions devoted to agriculture, live stock and related subjects. Of these, 764 are in the East North Central States, 573 in the West North Central States, 372 in the Middle Atlantic States, 229 in New England, 211 in the South Atlantic States, 181 in the East South Central States, 157 in the West South Central States, 129 in the Pacific States and 124 in the Mountain States.

In the classification by areas contributing to the exhibits, it appears that 839 are county fairs, 466 are intercounty fairs, 250 cover less than county area, 200 are interstate fairs, 155 are state fairs, 129 are national, 102 are international and for 599 no information was received with regard to area covered.

Classification with regard to the kind of exhibit shows the following results: General agriculture, 1,647; poultry, 685; poultry and pet stock, 86; horses, 81; horticulture, 80; dogs, 74; live stock, 22; poultry, pigeons and pet stock, 21; poultry and pigeons, 19; floriculture, 13; dairy products, 7; corn, 4; apiculture, 1.

A brief history of agricultural fairs in this country is found in the bulletin. What was primarily a market fair was held in October, 1804, "on the Mall on the south side of the Tiber, extending from the bridge at the Center Market to the Potomac," in Washington, D. C. The city government appropriated $50 toward a fund for premiums and residents subscribed an equal sum. This amount was awarded "to the best lamb, sheep, steer, milch cow, jack, oxen and horse actually sold." The third fair was held in November, 1805, after which these market fairs were discontinued.

More closely related to the inception of the fair movement in this country were the annual "sheep shearings" established and continued for a dozen years by George Washington Parke Custis at "Arlington," his estate opposite Washington, D. C., on the Virginia side of the Potomac River. A program of one of these rural festivals, as published in a Georgetown, D. C., newspaper of the day, specified premiums for certain classes of sheep and of wool, for homemade fabrics and garments, and for soil improvement.

The first full fledged agricultural fair, primarily for competitive exhibits instead of for marketing, was held at the Columbian Agricultural Society, which was organized in 1809 by a number of gentlemen interested in agriculture, residing in Maryland, Virginia and the District of Columbia. Its first exhibition was held in Georgetown May 10, 1809, and the National Intelligencer of that day reported that it was "attended by a numerous assemblage of members of the society, among whom we noticed the President and his lady, the Secretary of State, the Secretary of the Treasury, the Secretary of War, the Comptroller, Register, etc., and many other ladies and gentlemen of respectability." This fair was mainly devoted to domestic animals and manufactures. Semi-annual fairs were held until the spring of 1812, when the war with England and the expiration of the time for which the society was organized caused its discontinuance.

The oldest existing agricultural society that holds fairs is the Berkshire Agricultural Society, Pittsfield, Mass., which held its first fair in the autumn of 1810, or only one and one-half years after the first fair of the Columbian Agricultural Society

FIELD NOTES

Alfalfa land is advertised by the Kansas Southern Railway in this issue. Stockmen take notice.

Read the new Absorbine advertisement in another column.

A $10,000 stallion (standard bred) is advertised for sale by William Hicks, West Chicago.

John McDonnell, Humboldt, S. Dak., advertises a masturbation prevention appliance. We ask all stallion or jack owners to mention the American Breeder when writing him.

Look up the new advertisement of the Visio Remedy Association, 2475 Calumet Ave., Chicago, Ill.

L. C. Shephard of Irwin, Ia., has some Scotch Shorthorn bulls advertised for sale in this issue, both reds and roans. See his ad.

Pure bred Duroc pigs, eligible to register, is offered for sale by J. W. Campbell, Fairpoint, Ohio. Read his ad.

Any one wanting to trade a stallion for a house and lot should not fail to read the ad. in this issue of B. F. Solida, Denmark, Ark.

W. F. Burnett of Vergennes, Ill., has a German Coach stallion and a jack colt for sale. Read his ad. in this issue.

Full blood Wyandotte hens and cockerels are offered for sale by W. F. Burnett, Vergennes, Ill. Also one Poland China boar a year old.

Full information about the stallions, jacks and brood mares offered for sale in this issue by Edward Orne of Fayetteville, Ark., will be given upon request.

E. A. Wallace of Dallas City, Ill., has some Percheron mares, suckling colts and a stallion advertised for sale in this issue.

Will Bellman of the firm of Ives & Bellman, Delavan, Wis., has purchased Mr. Ives' part of the business and would be glad to hear from any one in the market for Percherons, Belgians or German Coach stallions or mares. He should be addressed as Will Bellman, Delavan, Wis.

If in the market for Percherons don't fail to see what Fred Chandler of Chariton, Ia., is offering.

William H. Reid of Ohio City, Ohio, has some O. I. C. boars that he is pricing at $25 each. Read the ad.

Two registered Hereford bulls are advertised for sale by John W. Carolan, Booneville, Ark. He also has pure bred Poland China pigs. If interested, write him for particulars.

Any one in the market for a jack or jennet should not fail to read the advertisement in this issue of J. R. Reynolds & Son, Guthrie, Mo.

Pure bred Mule Foot hogs are offered for sale in this issue by H. Warren of Brownsburg, Ind., at $15 and $25 each.

A. Latimer Wilson of Creston, Iowa, has 150 stallions, imported and homebred to sell. Write him for particulars.

H. B. Hallock of Englewood, Kas., has 150 Percheron mares, stallions, jacks, mules and jennets that he is offering at reasonable prices. Write for full particulars.

A few house wrecking and salvage companies have saved thousands and thousands of dollars to the farmers of the United States by making low prices on lumber and building material. One of these companies, The Housewrecking, Salvage & Lumber Co., 1735 Troost Ave., Kansas City, Mo., puts out a free bargain bulletin each month in which is listed the new bargains which an active concern like this always secures for its customers. If you will write this company, mentioning the American Breeder, you will be put on its mailing list for every one of these bulletins that it sends out.—Advertising.

Stallion Wanted on a Trade

I want a draft stallion weighing not over 1500 and not over 7 years old. Prefer chestnut or black. I have a house and lot in Letona, Ark., to trade on such a horse. **B. F. SOLIDA, DENMARK, ARK.**

FOR SALE—ACCOUNT OF FILLIES.

Curator 4723 (1757); Imported German Coach; black; 8 years old; a sure and good breeder and a prize winner at International.

Also one jack colt 8 months old, sired by Empire Jr. 4315, by Empire by Gov. Woods (half brother to Superior Mammoth; first prize jack at Chicago World's Fair). He has 30-inch ear, a good head with plenty of bone and body. Priced right. **W. F. BURNETT, VERGENNES, ILL.**

PERCHERONS, BELGIANS AND GERMAN COACH MARES AND STALLIONS

of all ages for sale. I have recently taken over the entire stock of horses formerly owned by the firm of Ives & Bellman and can furnish patrons with first-class breeding stock of the foregoing breeds. Have a fine lot of last spring's and yearling colts, as well as mature stock to select from. Address, **WILL BELLMAN, R. 1. DELAVAN, WIS.**

PERCHERONS FOR SALE.

Registered in Percheron Society of America. One 4-year-old black imported Percheron stallion of exceptionally good breeding, size and bone, and a breeder. Colts to show.

Also four mares and two suckling colts. I will price these for quick sale as I wish to quit business. Write for description and number of pedigrees. **E. A. WALLACE, DALLAS CITY, ILL.**

STALLIONS, JACKS AND BROOD MARES.

For sale; all registered. Other good driving and saddle stock. Thirty first-class Missouri mules, 3 years; most of them broken. Will sell at right prices. For information write **EDWARD ORNE, FAYETTEVILLE, ARK., ROUTE 2.**

IMPORTED AND HOME BRED STALLIONS AND MARES.

PERCHERONS, BELGIANS, SHIRES.

The best importation we ever made is now in our barns ready for inspection. The mares include some of the best fillies that came out of the Perche this year. See what we have before buying elsewhere. **Address Hart Bros., Osceola, Iowa.**

SACRIFICE

To Quit Business.

Two aged draft stallions at less than market gelding prices; one imported Percheron; weight 215 pounds; sound. Cash, or would trade for brood mares, jennets or calves.

Address S. J., Care American Breeder.

150 STALLIONS.

Imported and home-bred stallions. I guarantee to sell you stallions for less money than any firm in America. Come to a Live Horse Market and see all draft breeds. Reference, any Bank in Creston. **A. Latimer Wilson, Creston, Iowa.**

CLYDESDALE HORSES

Stallions and mares of all ages for sale.

Also Shorthorn Cattle.

W. A. DeMerritt

Route 2, Plainfield, Ill.

150 PERCHERON MARES, STALLIONS, JACKS, MULES AND JENNETS.

For a number of years I have been breeding Percheron horses and mules. This season I have decided to quit the business. I offer my mares, mules, jacks and jennets for sale at reasonable prices. This is good stuff. **H. D. Hallock, Englewood, Kas.**

WANTED PERCHERON STALLION.

Registered; two years old and used to pasture, to catch the unsettled mares. Will give a big four year old; black; 1800 pounds for one. **S. S. Langford, Craig, Burt County, Neb.**

PERCHERONS.

Imported and home bred stallions and mares, from $200 to $900 each. **H. Redenius, Rushmore, Nobles County, Minn.**

AN INSURANCE MAN'S VIEW OF THE QUESTION.

To the American Breeder:—In a recent issue of the Breeder you urge the formation of a mutual company to insure the lives of stallions and jacks. What seems to you to be an undertaking to be commended and urged is one in fact to be condemned and discouraged in the true interests of owners, for any company or association organized to do a mutual live stock insurance business will fail, and the owner, who relies upon his policy in such company, will in the end find that he has paid his money for nothing, and worse still, if a loss comes has missed the opportunity to have had safe insurance in a reliable stock company.

One proof that every such company will fail, is the fact that every such company has failed, except several such, organized recently, whose turn will come. An examination of the subject as shown by insurance reports on file in the several state departments discloses that in the past thirty years a multitude of mutual live stock companies have been organized throughout the United States, have made one report or several reports to the departments and then disappeared, and when the Northwestern Live Stock Insurance Company of Des Moines was organized in 1907 there was not a single mutual company, and only one stock company insuring live stock in the entire United States, notwithstanding that the business of insurance generally has in the time stated grown by leaps and bounds. In such disrepute was this class of insurance, by reason of the failure of mutual companies and the consequent loss to insured owners, that capital could not be interested for the organization of even stock companies, and in such disrepute was the business among owners that a whole generation of victims had to die off and new owners take their place before even stock companies could get a foothold.

Why have mutual stock companies always failed? The reasons are many and sufficient. Primarily, they do not collect sufficient premium, and do not collect it in advance. Another reason is that the opportunity is taken by too many owners to sell their animals to the association. In other words, the moral hazard is present to a far greater degree in live stock insurance than in any other, and a mutual company does not feel at liberty, as does the management of a stock company, to reject doubtful risks, for fear of giving offense, and while this may be true also in the case of some stock companies, it is always true of a mutual. I am not discussing here the case of a company organized for the sole reason of creating positions for the organizers, which is too often the case, but considering a company organized honestly for mutual benefit. Even such companies have always failed and will always fail for reasons before given and for others; the losses in this business are at times terrific, claims pile up, the hat is unavailingly passed and the court appoints a receiver. These are some reasons which account for the indisputable fact that mutual live stock insurance companies have one and all failed in the past, and I might add another; an experienced and competent underwriter will not take the management of one of them, and they are therefore in the hands of men inexperienced in the business of insurance.

As to premium rates: you assume without knowledge as to facts, that the rates charged by the Northwestern, and the several other companies, are too high. Out of abundance of experience we know that they are not too high; in fact as to one class at least; brood mares, the rate is too low to even make us whole. You do not know as we do the magnitude of the risk assumed by a live stock company, nor does the owner appreciate it until he has a loss.

Our undertaking includes loss by fire, lightning and windstorm. It will not be contended that fire companies covering for these risks and charging a basis rate of one per cent for one year and three per cent for five years, charge too high a rate; and if this is conceded, then our rates of from six to ten per cent per annum are too low rather than too high, for our tabulated experience proves that these risks are less than one-twentieth of our total risk. In other words, of losses incurred, only one in twenty-one is by fire, lightning or windstorm, but while our risk is twenty times as great, our rates are less than half of twenty times the rate charged by fire companies.

The last insurance report of your state, that of the business of 1911, shows that live stock insurance by stock companies, is to say the least, not an alluring proposition to capital. Of the three companies licensed in Missouri, the Northwestern, which is carefully managed, with a very small expense ratio, made eight per cent on its capital stock from underwriting. Of the two other companies, one made two and one-half per cent, and the other shows a loss from underwriting. This is for the entire business of the companies. The reports for 1912 are not yet issued, and I do not know the experience of other stock companies for that year, but our report will show even less profit on the item of underwriting than for 1911.

If a carefully managed stock company like the Northwestern with an expense ratio of only eleven per cent, aside from commissions, can make only eight per cent on its capital stock from underwriting, and other companies still less, what sort of an outcome is to be expected of a mutual company, in the hands of inexperienced though honest men, encountering continually the applications for insurance on animals at fictitious values, and the many other opportunities to take on bad risks, with no reserve and surplus accumulated wherewith to

EIGHT JACKS FOR SALE.

Combining the blood of Autar, Black Giant and Lime Stone Wonder; all black, white points.

Have either a trotting or a coach stallion for sale or will trade for a good Percheron mare or jennets. Must be a good one. These horses are sound and the very best of breeders, but have one too many. **Chas. Wyatt, Petersburg, Pike County, Ind.**

JACKS AND STALLIONS

I can furnish a few extra good registered jacks and jennets, also a few choice draft stallions, for less money than any one. **L. Donaldson, Olney, Lincoln County, Mo.**

TREATMENT FOR JACK SORES.

To the American Breeder: With your permission I will offer the following as a treatment and cure for so-called jack sores. Apply freely to affected parts for several days with spray or swab, hydrogen peroxide, full strength, which will cause sore to foam and soon all pus germs will be destroyed. Then dust with calomel. If granulation or proud flesh is present, apply the calomel every other day until two or three applications have been made, if conditions require. Then wash clean with soft water and castile soap; dry thoroughly and apply a little boric acid to assist nature in forming a covering. I believe this will be a boon to a great many jack men if properly followed up and some attention as to diet given the affected animal. The above preparations are cheap and can be obtained at almost any drug store.—G. T. Poage, Christian county, Mo.

HORSE AND MULE TWINS—From a pony mare belonging to D. G. Roll, Oral, S. Dak. Colts one day old.

CROUCH WINNINGS IN PARIS SHOW.

To the American Breeder:—We are in receipt of a cablegram from Mr. George R. Crouch who is now in Europe, advising us that at the great Paris show, recently held, that our horses won the following prizes: In the aged Percheron stallion class, fourth prize; in the 3-year-old Percheron stallion class, first, third and fourth prizes; in the 2-year-old Percheron stallion class, third prize. In the aged Percheron mare class, third prize; in the 3-year-old Percheron mare class, first prize. Best group of stallions, first prize; best group of mares, first prize.—J. Crouch & Son, La Fayette, Ind.

Warranted to Give Satisfaction.

Destruction of my barns by fire makes this sacrifice imperative. **W. T. Wilkinson, Eureka, St. Louis County, Missouri.**

Bring Out Your Mature Jacks

Entries Close July 15

Competition in this contest is limited to mature jacks—that is, jacks four years old or over. Each jack, as its photo and description are received, will be given an entry number, which will be published with the picture and measurements. No names will be given out until the awards are made. Then all of the entry numbers will be published, along with the names of the jacks, and owners who entered them. Each photograph should give a straight side view of the jack's body, but may show his head turned slightly toward the camera if the owner desires. Only a few measurements are required. The blank below shows which ones. These are the measurements required by the Standard Jack and Jennet Registry of America. These measurements, and a good, clear photograph will show pretty accurately to an experienced man, what the jack is as an individual. Measurements should be taken with a tape line or string drawn tight enough to press the hair tight to the skin, but not enough to press into the flesh. We reserve the right to have a committee remeasure any jack and to publish the result of its findings. Photograps can be any size, but those on which the jack's body measures two and one-half to six inches are usually best. It is most important that they be clear and that the jack stands straight and naturally when photographed.

The judges will be experienced jack men.

Make all entries in the blank below; clip it out and mail to the American Breeder. If you do not want to cut your paper, drop us a postal card and we will mail you some printed blanks.

ENTRY BLANK FOR MATURE JACK.

American Breeder Contest—Kansas City, Mo.

Enter my jack, as follows:

Jack's Name..... Age.....

Height (measuring from a point level with the top of the withers straight to the ground),.....inches.

Postoffice ..... State.....

An Indiana Breeding Farm

Mr. Whitely Reports Success With Reduced Cash Fee Under a Contract That Requires Mare Owners to Do Their Part.

To the American Breeder:—I notice in your valued journal that you have an article in the last issue in regard to the standing of stallions or jacks and the trouble that the owners experience in collecting service fees. I have tried a great many different plans, but this year have adopted a new one, which I am glad to say is working just fine.

The great trouble in our section of the country is that there are a great many scrub stallions and jacks; the owners of them will make almost any condition in order to get business. They even guarantee the colts to stand and suck and be perfectly sound, and do not expect to collect their service fee for six months or a year after the colt is foaled.

Then again, in many cases owners dispose of their mares in public sales, guaranteeing them to be in foal, or they move out of the county and state, in which event the owner of the stallion or jack has no way to find out whether the mare is in foal or what becomes of her, and if they have any bad luck with their colt, even after it is a month or two old, they expect the owner of the stallion or jack to stand at least half of the loss by throwing off one-half of the service fee.

For the past three years I have been standing an imported Belgian stallion and a mammoth jack at $15, guaranteeing the mare to be in foal; the service fee to be due whenever the mare was known to be in foal, but in a great many cases the mare was never bred but once, never was returned for retrial or rebreeding, the farmers claiming that they did not have time on account of putting in their corn.

So that in the spring of the year I have written to all of the breeders and about four out of ten would answer my letter, although I inclosed a stamped addressed envelope, and the balance would remain silent and after waiting a month or two, I started a collector out in an automobile and he has spent weeks traveling around trying to locate these mares, and in a great many cases have found colts all the way from two to six months old; even then it was hard to collect the fee, the farmer saying they were a little short and would be in and settle some time soon.

This was all very annoying, so that I adopted a new plan and I inclose herewith original and duplicate contract (see contract at bottom of page —Ed.) that I have submitted to the breeders which I think fully covers every point, and I stand the stallion and jack at $10 cash at the time of service, and to this I make no exception. The mare must be returned upon the return dates which the superintendent of the farm inserts on the back of the agreement, and if from any cause the breeder does not return his mare upon those dates, he forfeits his claim to any interest he may have in the $10 which I have deposited in bank; consequently it is now the farmers running after me; I have his money and if he complies with his contract and tries his mare upon the dates specified and she proves to be barren and will not breed, I then return to him one-half of the service fee, $5, but of course I never breed that mare again. I pick out the very best mares to breed on the original proposition and I use either the natural system of breeding or the capsule system. Up to date I have not had a man miss his date for returning his mare. Only a very few have taken the second service.

Of course this service fee looks small, but when you come to consider that you collect the money in advance in every instance and that you are out no expense whatever for collecting any service fee, I am satisfied that in the end this last plan is the best arrangement and will return to the stallion or jack owner a larger per cent of profit than if he devoted his entire time to the breeding of mares, collecting his money and charging $15 for the season, guaranteeing the colt to stand and suck.

In the start quite a number of farmers objected to the arrangement, but the better class of farmers who had mares that were regular breeders and farmers that had some regard for their obligation, thought that the arrangement was all right, and my superintendent always takes the time to explain to a new breeder the why and wherefore and why we are obliged to breed on these terms, and I do not think there has been over two or three farmers that have objected to this plan; their only excuse was they lived quite a distance and it was not always convenient to return the mare on the dates specified, but we must treat everyone alike, and we have made no exception, and for every man

(Form of Contract Used by Mr. Whiteley.)

HOG CREEK FARM

Breeding Proposition, Season of 1913.

TO BREEDERS

On account of the trouble, unnecessary labor and expense experienced under the old plan of breeding, by reason of the failure of mare owners to return their mares to my Hog Creek Farm on the dates indicated for retrials, and their failure to properly notify me, in writing, as provided by the Breeding Agreement, together with their disregard of the provisions of the agreement making the service fee due when the mare is sold, and their failure to pay promptly for mares that proved to be in foal,

I have decided that in future I will breed mares to any **Stallion** or **Jack** on Hog Creek Farm **only for spot cash** on the day of first service and have fixed the season's fee at $10.00 under the following conditions:

When the mare is first presented for breeding the service fee of $10.00 **will be required to be paid in cash** before the mare is bred. The owner of the mare is to return her to Hog Creek Farm on the respective dates **for retrials and rebreeding as indicated on the back of this sheet.** The owner of the mare to have the privilege of rebreeding the mare five times, but no other mare is to be substituted for the one bred first.

If the mare owner complies with these provisions and returns the mare on each of the five periods indicated on the back of this sheet and she proves not in foal, it will be evident that the mare is barren and will not breed, and one-half of the service fee paid, or **$5.00 will be returned to him.** The other $5.00 will be retained by Hog Creek Farm for the use of its Stallion or Jack in trying to get a mare in foal that would not breed.

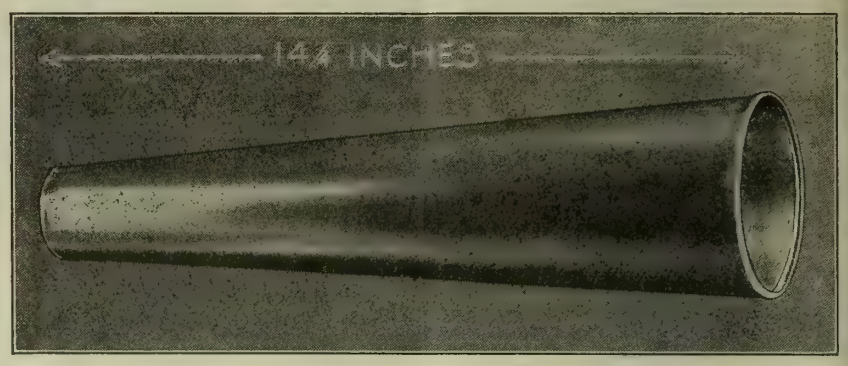
Should the owner of the mare fail for any reason to return the mare to Hog Creek Farm for retrial on the dates set out on the back of this sheet he forfeits the return of any portion of the service fee paid by him. If the mare should die before the five trial periods have expired the mare owner will be refunded one-half of the service fee paid just as if mare did not get in foal. Should any of the retrial dates fall on Sunday the mare will be bred on the Saturday before or the Monday following.

The spermatozoa of the Stallion and Jack on Hog Creek Farm has been examined under microscope by a competent veterinary and pronounced exceptionally fertile. The man in charge of the breeding business on the farm is thoroughly experienced in all the latest breeding appliances and everything will be done to get mares in foal and prevent any accidents, but the Hog Creek Farm will not be held responsible for any accidents, and only guarantees mares to be in foal.

If this proposition interests you, call up Hog Creek Farm, using Old Phone No. 1061, and arrange with the manager for a date for breeding your mare.

BURT H. WHITELEY,
Owner Hog Creek Farm,
Muncie, Indiana.

I accept the above proposition and breed my mare (Name of Mare) under the above conditions.



(Signature of Mare Owner.)

R. F. D. No..... Box....., Muncie, Indiana.

Editor's Note:—When the mare is bred this contract is signed up in duplicate, the mare owner keeping one copy. On the back of the contract the stallion owner receipts for the $10, paid down, and fills in the dates for retrial.

GET A SPECULUM

if you want to know the condition of a mare's genital tract and whether or not it is diseased. A Speculum is also the only means of examining the cervix to make sure if a mare is in foal. Many an abortion has been caused which the use of the Speculum would have avoided.

This Speculum is made of good material, nickel plated, and with proper care will last a life-time. **SENT POSTPAID FOR $3.00.**

THE KANSAS CITY IMPREGNATOR CO.

12th and Central Sts., Kansas City, Mo.

NIX ON MASTURBATING.

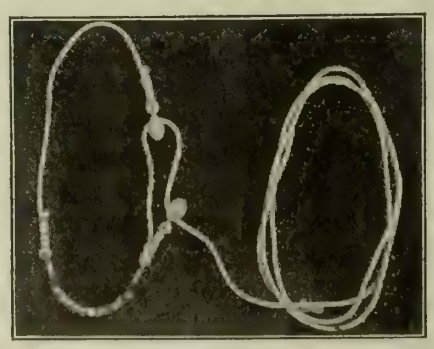
IMPORTANT! TO STALLION OWNERS.

As the breeding season is now about over, all owners of stallions will need something to prevent their stallions from masturbating.

As is well known by all students of horse breeding no stallion is free from this habit, and in many instances, if permitted to continue, leads to the ruination of the stallion for future breeding.

NIX ON MASTURBATING is the only device ever invented that is an absolute preventive for this habit.

You can save many times the price of this article in feed and care for your stallion. But that is the least benefit derived from the use of it. By preventing this habit, your stallion is a much surer colt getter, making your income from him much larger and giving better satisfaction to your customers.



NIX ON MASTURBATING is guaranteed as an absolute preventive or your money refunded.

For further information, price, etc., write to

JOHN W. McDONNELL, Humboldt, South Dakota

Patent Pending

"CONQUEROR" STALLION BRIDLE

GUARANTEED TO HOLD ANY STALLION OR JACK.

This bridle is made of especially selected material, absolutely the best on the market.

Can be adjusted to fit any size head and for either hard or tender mouths.

Just the thing for breaking runaways or kickers.

Never tie an animal with this bridle. If he got to pulling he could split his head.

that has bred a mare to my stallion or jack, the money is deposited in bank in a separate account and will not be checked upon until his mare is known to be in foal or he has forfeited some part of his agreement.—Burt H. Whitley.

SPEAKING FROM EXPERIENCE AND OBSERVATION.

To the American Breeder:—I see a few articles in regard to different breeds for range purposes. I was one of the strongest Percheron men in the country. Nothing else looked good to me. I ran a horse ranch eight years and I finally had to go to the Belgian. They make more draft and quality, to my notion, than any other breed; get more draft quickly, on light mares, either in this country or on the range.

As for jacks, I have raised a few and have kept jacks for nearly 20 years. I tried breeding them on range mares, also with very poor results. Had better luck with impregnator and capsules than from serving mares. I bred a mare with impregnator, hog tied on the ground, and she caught the first time.

As for slow jacks, I agree with Mr. Collins. It has been my argument from a close investigation, that if people will quit using slow jacks on jennets, and raise their jacks with filly colts, they will break like stallions. Now to some beginners that haven't had experience, I say, stick close to the advice given in the American Breeder—it is reliable, and the only paper for stallion owners as well as mare owners.

I have been using capsules and impregnators for over ten years with great results. Used capsules on a number of mares this spring; none have returned up to date. This is an exception. I use the Carlson semen extractor, also the metal solid barrel impregnator. Would not be without them, as I get mares with foal every year that have been bred for a number of years without settling. I am careful of diseased mares; do not serve them.

I want to attend the breeding school. We are living in an age of advancement and we must push ahead and not do as our great grandfathers did. In years past there were lots of grade mongrels kept around; bred 20 or 30 mares; bred three mares one day and missed two or three days; used the double cover; threw cold water on after serving and a lot of other foolish things. I breed every mare of my own that I can with a capsule or impregnator and consider it much surer. If we will all do our part we will make the American Breeder greater than it is, and I know a man can learn more in six months from it than he can in a natural life time by listening to some old fogy talk.—O. T. Karr, Nodaway County, Mo.

HORSE AND MULE TWINS AGAIN.

The old saying of "nothing new under the sun" was broken last week when a mare belonging to a man near Hewins, gave birth to twin colts, one of them a mule and the other a horse colt, both doing fine.—Sedan (Kansas) Times-Star.

BUT FAILED TO GET IT PATENTED.

Farmer—Yes, sir, that hired man of mine is one of the greatest inventors of the century.

City Boarder—You don't say! What did he invent?

Farmer—Petrified motion.—Judge.

QUESTIONS AND ANSWERS

(Continued from page 5.)

of mine has a mare that is nine years old and she will take the horse almost any time, and is apparently never in season, or at least don't show it. Should I breed her with capsule, and when?—Ohio Subscriber.

REPLY—Your question is not very plain. When a mare receives a service willingly she is usually considered in season. We think your mare should be examined. If one or both ovaries are not diseased she should be treated before being bred.

FOALS PREMATURELY—I have a neighbor that has a Percheron mare seven years old; weight 1,600, that has her colts in ten months. They just sleep and lie around until the eleventh month and then they do all right. She has raised two colts and they both did that way. While the mare was carrying the last colt he did not work her at all toward the last and she carried the colt two weeks longer. What would your advice be? He wants to breed this mare. What do you think is the trouble?—Ohio Subscriber.

REPLY—This mare should be bred late in the season or better still, in the fall, so that she can have a considerable length of time in idleness. If this mare is allowed to run in the pasture during the latter end of pregnancy, the trouble will probably disappear. This may be one of those mares in which the uterus is not as large as it should be, but as time advances this difficulty may be overcome by nature. During the spring rush it is not usually convenient to lay these mares off. This is the object in breeding them in the fall. The pasture should be an excellent place to keep this mare during the last two or three months of her gestation.

ARGUMENTS OF SCRUB STALLION OWNERS—Some say here that in capsuling one mare from another that the foal will take after the mare that the semen is taken from. I say not. Will you answer whether or not it is a fact?—Arizona Subscriber.

REPLY—Natural services are made only when mares are in heat. The semen is taken from the genital tract. At this time the ova of the mare has not been liberated so that probably it could not reach the uterus for several days after the heat period closed. There never has been a case of this kind on record that we know of. If it was possible to get the egg of the mare during a heat period, mares might raise jennets or jacks, or jennets might raise horse colts. The semen is frequently taken from a mare and used on jennets.

JACK MASTURBATES—I have a jack coming four years old and he never has served anything and I can't get him to serve. I tried him last year and am also trying him now. He will make the leap but won't enter. I notice him every day or two masturbating and I leave the mare in the lot all day long with him. He is fat and as fine as I ever saw; nice and gentle. Some say to use a jennet with him, but I have heard it said that you will always have to use one then—Missouri Subscriber.

REPLY—Methods used to discourage this habit might cause him to be still slower. Try putting a little urine from a jennet on the mare's tail. Be very sure that the mare is very gentle and not very large. Try to get him to make a service if you can, then try to prevent him from masturbation later on.

IN BREEDING—I have a young mare out of a common mare and a registered Percheron horse. When she was three years old I wanted to breed her but could find no good horse around here, so I bred her to her father. I got a splendid mare colt from her. How near full blooded is this colt?—North Dakota Subscriber.

REPLY—Three-fourths Percheron.

DISCHARGE IS WITHDRAWN—I have a five-year-old Percheron stallion, sound and in perfect health. Mounts and covers mare better than any horse I have out of five head; not overworked; penis reduced as it should be when leaving mare, but whole discharge seems to follow and drops on ground from every mare he covers and is not turning them away as I would like, and the most of them, I think, are unsettled. Have not had him long enough to give the per cent. Kindly give cause for same, and remedy, if any. His penis is extra long.—Indiana Subscriber.

REPLY—Make the service in a large yard. After the stallion has mounted do not hold the mare's head if she is large enough to carry him. Let her take a step or two. If the lot has an elevation, turn her head up hill. A better method is to test the semen under a microscope and if found satisfactory, catch the fluid and use a capsule. He possibly will not do this so badly on tall mares.

BREEDING TWO-YEAR-OLD MARES—I have several two-year-old mares. Now would they make better brood mares if I would breed them at two years old or wait until they are three years old? Would they make a better growth if I would not breed them at two years old?—Kansas Subscriber.

REPLY—If your mares are well developed at two years of age, and you are in a position to give them extra care for at least another year, we would advise breeding them. But we must first get the meaning of "well developed" established before going further. In order to develop draft mares, especially, this should be started before they are weaned. They should be on full feed before they are weaned and given an abundance of good, strong feed consisting largely of oats until they are well developed at two years of age. They should be broken to harness during their two year old form. They should not be worked much, just enough to be nicely broken. They will require a little more feed during pregnancy. In fact, it is necessary to give mares and colts plenty of feed at any age if one is to expect a reasonable profit. Well developed animals always make better horses and will several times pay for the extra feed. One cannot estimate the real value of a few dollars worth of extra feed in growing horses. There is no money, as a rule, in raising stunted stock of any kind.

THE RIGHT WAY

IN ALL CASES OF DISTEMPER, PINKEYE, INFLUENZA, COLDS, ETC., of all Horses, Jacks, Mules, Brood Mares, Colts, Stallions, is to

SPOHN THEM

On their tongues or in the feed put Spohn's Liquid Compound. Give the remedy to all of them. It acts on the blood and glands. It routs the disease by expelling the disease germs. It wards off the trouble no matter how they are "exposed." Absolutely free from anything injurious. A child can safely take it

50 cents and $1.00; $5.00 and $10.00 the dozen. Sold by druggists, harness dealers, or sent, express paid, by the manufacturers.

Special Agents Wanted.
SPOHN MEDICAL CO.,
Chemists and Bacteriologists,
Box 834. Goshen, Ind., U. S. A.

Jack Sores Cured

By Using Jack Sorine. Sold With a Cash Guarantee.

O. P. WILSON SERUM CO., Kansas City, Mo.

Enclosed find my check for $5 for a package of your "Jacksorine" for jack sores. This is for a neighbor and shows on its face that your salve is doing my old jack's leg some good.

June 5, 1913. W. H. HAYS, Bloomfield, Ky.

We guarantee Jack Sorine to cure any sore on the legs of a jack or stallion, no matter how long it has been sore or what caused it. You know we have a good⅓, reliable remedy or we could not guarantee it to cure all sores on the legs of stallions and jacks, without any restrictions. It is put up in a substantial box and sent promptly by mail. It is a paste and applied with a small brush.

Send money by bank draft or P. O. money order. Price $5.00.

O. P. Wilson & Co., 3754 Wayne Avenue, Kansas City, Mo.

Stannard's Processed Crude Oil

THE BEST DIP MADE

for killing lice and curing mange. One application will do more to kill lice and cure mange than three applications of any other dip made (it destroys the nits). ..... $5.00 for 52 gal. bbl.

I also carry a full line of lubricating oils.

I will pay $1.25 each for my crude oil barrels; $1.50 each for my refined oil barrels, returned to me at Coffeyville, Kas., in good order, less freight charges on same.

C. A. STANNARD, BOX A, EMPORIA, KANSAS.

ABSORBINE

TRADE MARK REG. U.S. PAT. OFF.

Reduces Strained, Puffy Ankles, Lymphangitis, Poll Evil, Fistula, Boils, Swellings; Stops Lameness and allays pain. Heals Sores, Cuts, Bruises, Boot Chafes. It is an ANTISEPTIC AND GERMICIDE [NON-POISONOUS]

Does not blister or remove the hair and horse can be worked. Pleasant to use. $2.00 a bottle, delivered. Describe your case for special instructions and Book 5 K free. ABSORBINE, JR., antiseptic liniment for mankind reduces Strains, Painful, Knotted, Swollen Veins, Milk Leg, Gout. Concentrated—only a few drops required at an application. Price $1 per bottle at dealers or delivered.

W. F. YOUNG, P. D. F., 388 Temple St., Springfield, Mass.

Don't Have a Blind One

"VISIO"

A Remedy for Moon Blindness

(Opthalmia), Cataract and Conjunctivits

Shying horses all suffer from diseased eyes.

"VISIO" will convince any horse owner that it is the best remedy for defects of the eye irrespective of the length of time the animal has been afflicted. No matter how many doctors have tried and failed, use "VISIO" under our money back GUARANTEE.

$2.00 per bottle, postpaid on receipt of price.

VISIO Remedy Ass'n. 2477 Calumet Ave., Chicago, Ill.

GET READY TO ATTEND

THE HORSE BREEDING SCHOOL

The Only Term Between Now and December Will Be Held August 11 to 16

Breeders with money invested in the business cannot spend a week's time and the tuition fee to better advantage than here, and there is no better preparation for the beginner.

HERE ARE SOME LETTERS YOU HAVE NOT SEEN BEFORE

Last year I attended the Graham Scientific Breeding School at Kansas City, and I was more than pleased with the school as I found it excelled anything I had anticipated, and in my opinion it will pay every man handling stock, although he may just be a farmer, having neither stallion or jack, to attend the school. There is no other place or no other school where information of such value to stockmen can be obtained. It is a school all to itself and deserves the consideration of every stockman.—T. J. Greer, King City, Calif.

In regard to the breeder asking if it would be profitable for him to attend the Graham Scientific Breeding School, will say: Yes, if he only expects to keep a few mares, it will pay him, and if he keeps a stallion he can't afford not to attend. I think the time is coming when the stallion keeper will have to have a license as well as the stallion, and the sooner it comes the better.—C. C. Painter, Stronghurst, Ill.

I cannot say enough for the system of Scientific Breeding as taught in your school. It is not only helpful—it is necessary!—James L. Ward, Waukomis, Okla.

Any breeder should by all means attend a term of the Graham Scientific Breeding School. What I learned in the August (1912) term of said school will be worth many times its cost to me.—John W. Carolan, Booneville, Ark.

It will pay any horse or jack man to attend the school first, then read the American Breeder. Be sure and prepare for the capsule system as the American Breeder teaches. There are mares that it is impossible to breed with the natural service that the capsule will get in foal, and you will find that the colts are just as good, or better, for you don't have to work your stock so hard.—N. S. Cox, Pattonsburg, Mo.

Having attended a term of the Scientific Breeding School, will say that any one who is interested in raising horses or mules, whether he is a stallion or jack owner, or mare owner, should attend the school. Instruction on any one of the many subjects will more than pay the expenses incurred.—Vincent Lyness, McHenry, N. D.

No stock breeder should miss the instructions and teachings given at the Graham Scientific Breeding School. Every man who handles stallions and jacks should make a special effort to attend a term of this school. The Graham Scientific Breeding School is doing a work that cannot be estimated too highly.—W. R. Clelland, New Hampton, Mo.

I used the capsule system last year as taught by the Graham Scientific Breeding School, with good results. If a man makes a failure along this line it is his own fault. You must be clean, quick and have the right temperature. You lessen the chance of infecting your horse or jack and do more business with the same breeding stock. I think it will pay any man to attend this school, and I wish to say right here that Graham is absolutely on the square and you will think so, too, when he gets through with you.—W. F. Dimick, Kiel, Okla.

I would not stay in the breeding business another day if I had to breed the old way altogether. I do not think that any man can make a success in the breeding business without attending the Graham Scientific Breeding School. I bred 200 mares last season, 100 with natural service and 100 with capsule, and the capsule mares are really showing up better than the others.—H. N. Highfill, Paragould, Ark.

If any breeder will shape up his business and go to the Graham Scientific Breeding School next term he will be well pleased. I know how he feels about starting, not knowing what he is going to get out of it, but this is one place where you get a square deal. I know it will be profitable for him to attend if he is a stock breeder.—R. H. Hubbard, Jet, Okla.

It's the greatest opportunity offered anywhere to make yourself an expert breeder, to learn to avoid the points of the breeding business that cause so much loss to stallion and jack owners every season. All of the instruction is practical and everything taught is demonstrated whenever possible. All instructors but two are expert post-graduate veterinarians doing educational work recognized by the United States Government.

SOME OF THE SCHOOL'S WORK, INCLUDING SUBJECTS TAUGHT.

Dissecting Mares, Anatomy and the Male and Female Organs, Physiology of the Generative Organs, Cells, Infection, Breeding Questions, Breeding Instruments, Foaling, Scientific Mating, Horse Judging, Mule Judging, Barren Mares, Barren Stallions, Abnormal Conditions, Diseases of the Foal and Fetus, Diseases of the Male and Female, Contagious Abortion, Feeding, Testing Breeding Stock, Determining a Mare's Breeding Condition, Buying Breeding Stock, Hereditary Defects, Horse Breeding, Rectal Examinations for Abnormal or Diseased Conditions; also tell whether a mare is in foal or not. Getting the Semen, Inserting Capsules, etc.

EQUIPMENT AND EXPENSES.

The school has its regularly equipped building, which is just north of Convention Hall, Kansas City, Mo. In the lecture room of this building are numerous charts, stereopticon apparatus for showing pictures and illustrations during the lectures, all kinds of breeding appliances and other equipment necessary for instruction in all the latest methods in horse breeding. A veterinary hospital is utilized in the dissecting work and the barns of dealers in mules and horses in the lectures on types, judging, etc.

Accommodations for all students will be arranged for by the school authorities without charge. They have reserved rooms and board at moderate rate—from $1.00 to $1.25 per day—sufficient to provide quarters for all who come.

Remember the date and prepare to be here next term. When you get here take Observation Park street car at Union Depot; get off at 12th street and walk one block east. **Tuition is $25, which entitles all students to a free return privilege for life.** For other information address

ARE YOU READY TO ATTEND?

THE HORSE BREEDING SCHOOL

The Only Term Between Now and December Will Be Held August 11 to 16

Breeders with money invested in the business cannot spend a week's time and the tuition fee to better advantage than here, and there is no better preparation for the beginner.

HERE ARE MORE LETTERS YOU HAVE NOT SEEN BEFORE

The Graham Scientific Breeding School is doing more good for the horse and mule raiser than can be counted in dollars and cents. It is the greatest educational institution of its kind in the world for the stallion, jack or mare owners. There is not a single one of such men who can afford to get along without at least one term or more, if possible. The manager, Mr. Graham, is a gentleman in the fullest sense of the word, with plenty of backbone and ability to successfully manage any bunch of men in a manner that few men can ever hope to acquire.—H. Heckmann, Jerico Springs, Mo.

That which is taught at the Graham Scientific Breeding School is not what it is often thought to be. It has a high moral standing; the instructors are all gentlemen of the highest character, both as to cleanliness and behavior, and the school is very scientific in its lines of teaching.—W. W. Anderson, Wilder, Kansas.

I have attended two terms of the Graham Scientific Breeding School, and I think no one can afford to miss going to this school who keeps a stallion. I want to attend at least one term a year. I think that if one only learns how to detect diseased mares it will be worth hundreds of dollars.—M. A. McMahan, Jerseyville, Ill.

A few months ago I saw an advertisement of Graham's Scientific Breeding School, teaching how to detect disease in mares, etc., and have since had the pleasure of attending. I am well pleased and think the time and money well spent, indeed. I hope to double my income, due to what I have learned. There were lectures from the highest veterinary teachers in America. One lecture alone is well worth the tuition.—John Gilmer Davis, Knapp, Texas.

I have attended the Scientific Breeding School two terms, I find every time I go, I learn as much more. I think this school should be attended by every breeder in the United States. There is no school in the world like this school. The faculty are the very best.—E. A. Wallace, Dallas City, Ill.

I have attended a term of the Scientific Breeding School (August, 1912), and I am more than pleased. The faculty are the best lot of instructors I have ever heard, and I don't think they can be excelled. I shall make it a point to come once a year.—E. L. Becott, Solomon, Kas.

Having attended three terms of your Scientific Breeding School, and realizing that repeated attendance is essential to the clearer and more vivid conception of your course of instruction, I desire to state that money could not be more profitably invested by those who manage, own, or feel interested in, animal production.—Sam A. Leath, Harris, Ark.

I cannot say too much for the Graham Scientific Breeding School. It has the best instructors obtainable and it is well worth the tuition to hear any one of them lecture just a little while. A stallion owner can get any amount of good by learning how to detect diseased mares, alone. A mare owner can get his money's worth by learning how to take care of his mare at foaling time and during the time she is carrying her foal. It is teaching the breeders of the country how to produce more of the good colts—that is what the country needs.—L. R. Lee, Roodhouse, Ill.

I was a student at the August, 1911, term of the Scientific Breeding School and was more than pleased. The faculty take special pains in answering questions until the students fully understand them. The only thing wrong is the tuition not being half enough.—J. H. Moormann, Solomon, Kas.

It's the greatest opportunity offered anywhere to make yourself an expert breeder, to learn to avoid the points of the breeding business that cause so much loss to stallion and jack owners every season. All of the instruction is practical and everything taught is demonstrated whenever possible. All instructors but two are expert post-graduate veterinarians doing educational work recognized by the United States Government.

BREEDING OBSERVATIONS II

Young Men Who Use Their Opportunities and Some Who Do Not. A Retired Farmer Making More From Breeding Stock Than He Ever Did From His Farm.

It mght be well to make a study of the people engaged in the breeding business. A careful study of those attending the sessions of breeders' associations reveals the fact that a majority of those in attendance are past the age of middle life. In fact, at some of these meetings a majority are nearing the three score year and ten mark.

The writer has attended many state and county breeders' organizations. Perhaps the best attendance of young men at any of the meetings last year was at Lincoln, Neb., where the writer had the pleasure of addressing an audience of several hundred. A majority of these men had not passed the third of a century mark, but as a rule young men from 20 to 30 years of age are not numerous at the important gatherings intended for the enlightment of those in this occupation.

Are these young folks not encouraged to attend or have they an opinion that the breeding of live stock is a disgraceful occupation?

There may be a few who have not realized the importance of producing more and better live stock. Practically every newspaper in the country makes mention of the fact that the fertility of the soil depends largely upon the amount of live stock kept. Every intelligent man also knows that an important part of the food supply depends on our domestic animals. The important thought at the present time is that the number of domestic animals is not keeping up with the population in this country.

The United States has a peculiar problem. In addition to the great birth rate the immigration to this country is phenomenal. In order that the live stock production meet the future demand there must be induced a general study of breeding subjects. One who has given this subject much study recently said that at least one-third of the mature females in this country were not producing, but that they could be made fertile with a little more study on the part of the American farmers and breeders. This statement may be slightly exaggerated.

The breeders are now facing a different problem from that of a generation ago. The cheap pasture has passed away and better quality must be produced; a better selection of breeding stock and better methods of handling—we mean better methods than are employed at the present time. While the country was open and there was an abundance of freedom, live stock produced much better than is usually the case on the average farm today.

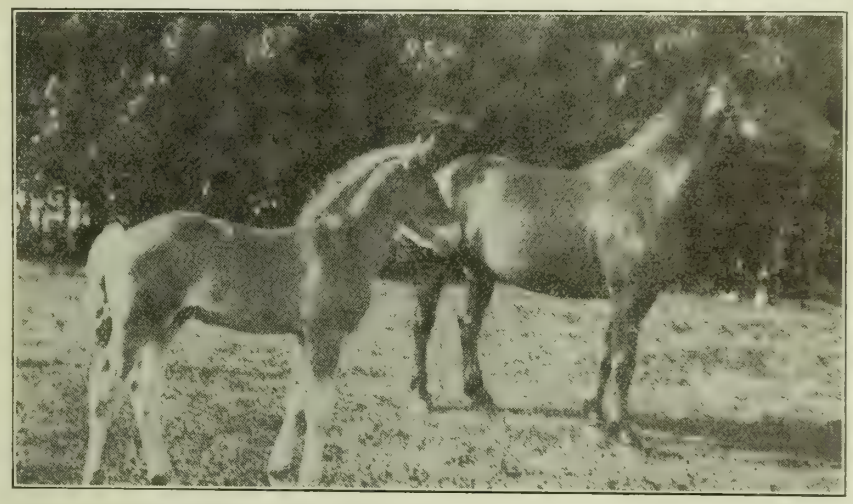
In conversation with a young man who had just reached the age entitling him to vote, he said that he did not like the breeding business because it was too "aggravating." A further study of the ancestry of this young man showed that the father landed in a certain corn belt state when a young man without much money. He purchased a yoke of oxen and grubbed stumps on ten acres of land; gradually increasing it until he had a 40-acre farm. This was his start. Now he is a wealthy man with a large family of boys who have not had the cares of the early settler. This family supports an automobile and works at such occupation as suits the fancy of the individual members. There may come a time when this young man may find it necessary to employ the use of a yoke of oxen on a 10-acre farm if he still persists in selecting a following in life that is not at some time "aggravating."

This particular young man had an opportunity to see a large number of mares examined and the difficulty in each case described for the benefit of those present. But the individual mentioned was not interested; his mind was on some other subject.

The individual who used the ox team has built up a wonderful stand with his stallions and jacks; but now wishes to retire. Any one of those sons could take this stand, which is established, and make a fortune within a few years by using the knowledge which his father would freely give, and such other means as could be readily acquired.

Another breeder was visited who has a son 18 years old. A partnership was entered into, the young man doing the work and the father furnishing the breeding stock. The expense and profits were each divided equally. The father stated that his son worked like a different man since he was doing business for himself; he took more interest in everything. The older gentleman offered suggestions but the young man had the entire management. He stated that the young man had nearly doubled the business because he was young and active, and visited many parts of his breeding district and encouraged new patronage.

The most hopeless case found during these visits was that of a wealthy individual who had several grown sons. About the first remark heard at that place was that he was going to quit the business because his sons were of no value. A further investigation revealed the fact that this man had treated his sons as hired help. They were told each morning what to do and knew well that suggestions from them would not be appreciated. These boys were good help when some one outlined their work, but they had never had any responsibility placed upon them. Several has wandered away from home but had not met with much success.



At another place a middle age man who had acquired a considerable property, decided that he would move to town, and in order to have an occupation he equipped an excellent breeding barn and devoted his entire time to the breeding business. With his wide acquaintance and general prestige it was soon evident that his competitors must find other locations. Where the breeding business is made a specialty instead of a "side line," much more results can be obtained. This individual paid particular attention to details and has an excellent system for everything. He states that he is making more clear money now from the breeding barn than he ever made from his large farm, and did not have one-fifth of the money invested. There is perhaps no other investment as good as a good breeding barn when it is conducted properly. This individual has an excellent draft stallion, a good road horse and a jack. By using modern methods he can breed about all the mares in that vicinity. He has made his business a success and is building up the live stock motive power in that section very rapidly. Instead of buying a barn full of stock he purchased a few good ones. This year he has bred 270 mares to the draft stallion, 195 to the jack and 73 to the road stallion. The road stallion he uses also as a business horse and a teaser. His expenses are not very great for feed and he can easily take care of this stock. He employs a man through the breeding season. He has large paddocks for the draft stallion and jack so that they are very little care out of season. The road horse gets plenty of exercise either in the buggy or under the saddle.

Another interesting place was where several stands are made during the week with a draft stallion. From six to ten mares per day was not uncommon at each of these stands. The owner of this stallion secures all the names and addresses for miles around in each direction from each of these stands. He notifies them by postal card the exact day and hour that the breeding will be done at each place. This brings the farmers together at a particular time so that all the mares present can be bred at one service. This method looks like doing business on the wholesale plan, and the remarkable thing about it is that there are not many breeders doing this. This is the best money making proposition in the breeding business—using just one outstanding individual and making several stands. This breeder is a graduate of the Scientific Breeding School and employed the lecturer sent out by this school to enlighten the farmers of that section in modern methods. He has had very little difficulty in introducing progressive methods in that section. He states that next year he will try to breed 500 mares to one stallion.

There is a great need for young men in the breeding business. Young men are holding most of the important positions today in other lines of work. Young men take chances and make progress where older individuals hesitate. But there are numerous young men in the business who are following in the footsteps of some individual, who has been acquiring new information as he worked. These young men will perhaps see the necessity in after years of not getting more familiar with modern breeding methods.

There is a wonderful difference in men. One man may be perfectly contented with his percentage of colts; another is continuously striving to increase the business; still others have an anxiety to know all that can be learned.

There is no occupation that will require more thought than the breeding business in general, and the breeder does a foundation work. It

HERE IS A "CERTIFIED" CAPSULE COLT.

To the American Breeder:—I send you a picture of a mare and colt owned by Wm. Alley of Montevideo. The accompanying sworn statement tells just how the colt was got.—W. F. Dusell, Chippewa County, Minn.

State of Minnesota, County of Chippeka—ss.

William Alley, being first duly sworn on oath says, that he is a resident of the County of Chippewa and State of Minnesota with his office address at Montevideo, that on the 13th day of June, 1912, he was the owner of a bay Belgian mare by the name of Nellie. That on said day she being out of heat was bred with a capsule out of Laureat, a bay Belgian stallion, owned by W. F. Dusell of the City of Montevideo, Minnesota. That the said mare was never served again before or after during that season. That she foaled a light bay horse colt on May 7th, 1913, a picture of which, with its dam is hereto attached.

(Signed) WM. ALLEY.

Subscribed and sworn to before me this 24th day of June, 1913.

ALFRED K. FORMS,
Notary Public, Chippewa County, Minn.
My commission expires Nov. 1st, 1917.

is first necessary to produce the offspring before the veterinarian can treat it. Each class of live stock fills its particular field, and the great improvement resulting from scientific mating and delivery creates more wealth for the nation at large. The enormous loss each year that is caused by superior females failing to produce, is not noticed by the average individual. Neither are the efforts of those who have been able to increase the value of the live stock in their sections appreciated by every individual.

The breeding business is similar to other propositions wherein the faithful few must be depended upon for the principal part of this work. A writer recently said that education concerning live stock in a community could be rated by the character of the live stock. Certainly a very puzzling question is why mare owners will patronize a sire when they know (or at least have reason to believe) that the progeny at three years of age will not be worth over $100. For, according to the government estimate, producing such an animal costs about $100. On the other hand by mating the same female with a sire which is known to be a producer of excellent animals, the progeny might be worth $100 at weaning time.

The next question is, why will a breeder maintain a cheap, undesirable sire? Can it add anything to his reputation as a producer of better stock?

Before the highest ideal, both as to quality and quantity can be obtained, it is necessary that those engaged in a particular line of business shall make a special study in order to meet the great demand, and they should not be contented with the present quota of working knowledge. There is plenty to be learned on every side. Information comes to us in a peculiar form at times. Occasionally a boy can teach the oldest of us something new.

SHIPPING HORSES INTO IDAHO.

To the American Breeder:—A quarantine proclamation signed by Governor Haines of Idaho, May 5, 1913, requires all horses coming into the state to be tested with mallein by a state or federal veterinarian. When the horses have not been tested, the owners or parties in charge must notify the state veterinarian at Boise before proceeding more than two miles into the state. The testing must be done by an assistant state veterinarian whose fees are $5 a day and expenses.

All railroad companies, common carriers and all persons trailing or driving horses into the state must give due notice of their coming into the state and send the charts of tests to the veterinarian. It is usually more convenient to notify the assistant state veterinarian as more prompt action can be taken. For Northern Idaho these assistants are A. J. Powell, Coeur d'Alene; Dr. E. T. Baker, Moscow; Dr. J. N. Aiken, Nez Perce. For Southern Idaho: Dr. V. C. White, state veterinarian, Boise; Dr. G. E. Noble, assistant, Boise; Dr. J. H. Weber, assistant, Boise; Dr. J. H. Smith, Wendell; Dr. Southworth, Blackfoot.—E. T. Baker, Veterinarian, Idaho Experiment Station.

TAR WEAKENS ROPE.

Rope is often tarred to protect it from the weather. This is a somewhat doubtful practice as the acid in the tar weakens the rope to such an extent that engineers estimate tarred rope to be only two-thirds as strong as clean, new rope.

No kind of oil or other preparation has so far been found that will not injure the rope, except tallow. Tallow and graphite are used in making transmission rope, and for lubricating it when in use.—J. M. Drew, University Farm, Minn.

Veterinarians Are After Facts

Barrenness in Mares and Tuberculosis in Dairy Cattle Among Subjects of Importance to Breeders Considered by Missouri Valley Veterinary Association.

Several topics of general interest to the owners of stock were discussed at the summer meeting of the Missouri Valley Veterinary Medical Association at Omaha, Neb., June 30 and July 1 and 2, at which there were nearly two hundred veterinary practitioners of the Missouri valley, over half of whom were graduates of the Kansas City Veterinary College. That so many practitioners should sit in a close room for two or three days at this season, is ample evidence that these men are deeply interested in the ailments of stock and that they are making earnest effort to solve some of the problems which are daily presented to them.

There was one paper offered by Dr. B. F. Davis, state veterinarian of Wyoming, which caused a long and heated discussion and resulted in resolutions asking the federal government to take drastic measures to help protect the stock interests of the country. Dr. Davis' paper concerned the shipping of dairy cattle interstate and the issuing of fraudulent health certificates and tuberculin test charts and he directed his remarks chiefly toward the lax methods employed in the state of Illinois.

According to Dr. Davis, there is a very prominent cattle dealer, in fact, one of the most widely known in the country, who has made a practice of buying cattle which are known to be tubercular. He ships these animals to his farm in Illinois. Buyers of dairy cattle purchase the animals because they are good lookers and because they are accompanied by a regularly made up health certificate showing they have been tested for tuberculosis and clear of that disease.

Dr. Davis told of a herd which is now being held at a point in Wyoming because the authorities became suspicious of the test chart. Investigation showed the animals had been shipped from Illinois to Missouri where they were detected and not permitted to be unloaded. From Missouri they were sent to Arkansas and again held up for the reason that the certificate was suspicious. They were then shipped to Kansas and suffered a similar experience there. At last they were finally held up and placed under quarantine at the owner's expense.

Dr. Davis cited this as one of many instances which had come to his notice of a persistent effort on the part of this one shipper to place tubercular animals on the market. In several herds, reliable test showed as high a percentage of infection as seventy-five in one hundred.

Other veterinarians related similar experiences to those recounted by Dr. Davis, and among these were Dr. A. Bostrom, state veterinarian of Nebraska; Dr. K. W. Strouder, acting state veterinarian of Kansas; Dr. J. I. Gibson, state veterinarian of Iowa, and Dr. S. Sheldon, state veterinarian of Missouri.

The association went on record as registering a vigorous protest against such practices and as nothing could be done to make Illinois prevent the issuance of fraudulent health certificates, resolutions were unanimously adopted calling on the federal officials to place Illinois under federal quarantine until such time as that state was willing to protect interstate shipments.

Another very interesting feature of the program on the last day of the meeting was the clinic conducted by Dr. F. F. Brown of the Kansas City Veterinary College. Dr. Brown had collected a number of mares which had not shown any tendency to breed though served repeatedly and through the kindness of Mr. Frank Graham, editor of the American Breeder, he was enabled to make study of a great many more cases, a report of which findings were given at the clinic.

The clinic was held in sales pavilion at the stock yards, and the general public was invited, as Dr. Brown hoped to make his demonstration of service as an educational proposition for breeders. After calling attention to the many conditions which may result in sterility in the mare, a number of mares which had been reported sterile were brought in and careful examination made to determine if possible, what caused the sterility and what relief, if any, could be offered.

In the first case, it was found that the neck of the uterus was long and tortuous, which prevented the semen from reaching the ovum in time for fertilization to take place. In this case it was recommended that the mare be artificially impregnated by forcing a small capsule containing the semen through the cervix.

In another case it was found that the right ovary was cystic and the left one greatly indurated. The former condition served to keep the mare in constant state of excitement and as the operation for removal of the ovary is not very practical in the mare, it was decided nothing of certain value could be done.

In another case a very much enlarged ovary was found, but the exact nature of the trouble was not discovered in the limited time available and consequently no suggestion could be made as to the probable course to pursue.

In another case it was found that previous lacerations and consequent indurations prevented the semen from gaining proper access to the ovum, thus causing sterility. In this case it was recommended that the indurations be broken down and the mare bred later artificially.

In another case it was found that the ovary had simply atrophied from old age and in such case no treatment could be expected to overcome the condition.

In addition to this, Dr. Brown demonstrated the practicability of the several methods of artificial impregnation, including the capsule and syringe method. The demonstrations served to show the mare owners what value the veterinarian might be to them if his services were oftener sought.

Recognizing the importance of the Missouri Valley meeting in Omaha every summer, the Commercial Club of that city exerted itself to make everyone have a good time, even to enjoying a visit to the den of Ak-sar-ben.

STUDENTS VISITING BREEDING FARMS.

To the American Breeder:—During the past spring the advanced live stock judging class of the Missouri College of Agriculture, under the direction of Professor E. A. Trowbridge, visited several horse and cattle breeding establishments in Missouri. The points visited were: Jefferson City, Mexico and Estill, and the following firms were called on:

Hamilton Bros., Wallace Estill, E. D. Moore (Eaton Farm), Tom Boss, Lee Bros., Ben R. Middleton and James Houchin, all breeders of saddlers; W. A. Dallmeyer, Hereford cattle; Hugh Elliot and Peter McLachlan, Angus cattle. At Mr. Houchin's Onward Wilkes farm some choice Hackneys are bred, in addition to the saddlers.

The students who took the trip were: J. W. Arnold, G. T. Bone, Roger Brown, C. H. Caldwell, C. S. Caldwell, E. B. Devinna, Moss Gill, Carl Gillispie, Gran Goodson, F. W. Graves, Quincy Harrington, C. E. Howell, R. T. King, L. S. Kleinschmidt, J. S. Matteson, W. C. McDonald, C. R. Megee, Lynes Parks, G. H. Railsback, R. T. Shiner, C. V. Singleton, H. B. Squire, A. R. Troxall, R. M. Watkins, M. D. Wood.—C. S. Cardwell, Missouri College of Agriculture.

CONCERNING "IRRIGATED FEET."

To the American Breeder:—This term is not infrequently heard in eastern horse markets; it is a term of comparatively recent origin and is used to signify a condition of foot the very reverse of desirable.

Not so very many years ago whatever other criticism may be made of horses coming from the Rocky Mountain region, it could be taken for granted that so far as feet, legs and wind were concerned they were practically perfect.

The condition today is very different. They now come in two lots, small ones generally mean and big gentle cripples. The little fellows come from the range and the big ones from the farms.

To begin with, the bigger horse you breed the more trouble you have with their feet under the best of conditions. Nearly all the weight of a horse is supported by the wall of the foot and nearly two-thirds of the whole on the fore feet.

Horses running on the range, both from the distances they have to travel and from the nature of the ground, keep the wall well worn down; the foot being dry becomes hard, firm and compact and the tendency to spread is not greater than the power of the soft structures to hold things together.

On irrigated land there is nothing to wear the feet down and the wall becomes very long and flattens out, the sole is constantly damp and the junction between sole and wall becomes softened and often separated. This kind of foot is severely discriminated against at the markets.

The remedy is not so simple as might appear. After the condition is well established there is little likelihood of complete recovery, though much may be done by shortening, trimming and keeping the horse constantly shod. If a farmer is so situated that he can run his young horses on upland all the year when the ground is not frozen, he will not often be troubled, unless the hereditary tendency is very strong. If colts have to run on irrigated land the year round their feet ought to be trimmed at least five or six times every year (this is good education anyhow); and if this does not bring and keep the wall at a proper angle the particular property in question is unsuited to the breeding of horses.—A. W. Whitehouse, Colorado Agricultural College.

TO GET MORE "DOLLARS' WORTH" OF COLTS.

To the American Breeder:—I am greatly pleased with the capsule system of breeding. We had a very small per cent of mares that required more than one service. The mares that were not in the best condition were irrigated, in this way saved breeding them so many times. About 50 per cent of the mares that were treated last year got with foal. This increased the per cent of colts about 25 per cent. The greatest trouble in the horse breeding business is the inferior stallions standing for public service. This is largely the mare owner's fault; if they would not patronize these stallions they would not be kept for public service long. A good many of them breed to these stallions because they are cheaper; a few patronize them because they are nearer. There are a lot of mares being bred that never ought to be bred. Nearly every mare in the country is being bred regardless of size, age or anything else. The farmers would

produce more dollars worth of colts if they would just breed their best mares and give them a little more care.—F. H. Taylor, Harvey County, Kansas.

EIGHTEEN RULES FOR THE STABLE.

Following are the rules for stable care of horses, recommended by the Boston Work Horse Parade Association:

1. The best order in feeding is: Water, hay, water again, grain.
2. Never give grain to a tired horse. Let him rest and nibble hay for an hour or two first. Grain in the manger before the horse comes in looks bad.
3. Water the horses as often as possible; but let the horse that comes in hot drink a few swallows only, until he is cool.
4. Always water the horse after he has eaten his hay at night. Do not go to bed leaving him thirsty all night.
5. Do not forget to salt the horse once a week; or, better yet, keep salt always before him. He knows best how much he needs.
6. Give a bran mash Saturday night or Sunday noon; and on Wednesday night also, if work is slack. After a long day in very cold or wet weather, a hot mash, half bran and half oats, with a tablespoonful of ginger, will do the horse good. Put very little salt, if any, in the mash.
7. If the horse does not eat well, or slobbers, examine his teeth.
8. Keep a good, deep, dry bed under the horse while he is in the stable, day or night, on Sundays especially. The more he lies down, the longer his legs and feet will last.
9. In order to do well, the horse must be kept warm. Give him a blanket on cool nights in late summer or early fall, and an extra blanket on an extra cold night in winter.
10. In cold rains do not tie up the horse's tail. The long tail prevents the water from running down the inside of his legs, and keeps off a current of air from his belly.
11. Take off the harness, collar and all, when the horse comes in to feed. He will rest better without it.
12. Never put a horse up dirty or muddy for the night. At least brush his legs and belly, and straighten his hair.
13. In hot weather, and in all weathers if the horse is hot, sponge his eyes, nose, dock, the harness marks, and the inside of his hind quarters when he first comes in.
14. When the horse comes in wet with rain, first scrape him, then blanket him, and rub his head, neck, loins and legs. If the weather is cold put on an extra blanket in 20 minutes. Change the wet blanket when the horse dries. DO NOT WASH THE LEGS. Rub them dry, or bandage loosely with thick bandages. It is far more important to have the legs warm and dry than clean.
15. To prevent scratches, dry the horses' fetlocks and heels when he comes in, especially in winter; and rub on a little glycerine or vaseline before he goes out in snow or mud.
16. Examine the horse's feet when he comes in, and wash them if he does not wear pads. If a horse in the city is not shod in front with pads, tar and oakum, which is the best way, it is absolutely necessary to keep his feet soft by packing them, or by wrapping a wet piece of old blanket or carpet around the foot, or by applying some hoof dressing or axle oil, inside and out, at least three times a week.
17. Let the horse have a chance to roll as often as possible; it will rest and refresh him. Give him a little clean earth or a piece of sod to eat now and then; he craves it, and it is good for his stomach and blood.
18. Speak gently to the horse, and do not swear or yell at him. He is a gentleman by instinct, and should be treated as such. The stable is the horse's home, and it is your privilege to make it a happy one.

EFFECT OF AGE ON STALLIONS' BREEDING.

To the American Breeder:—I would like to have some information in regard to the relative value of young and aged stallions as breeders. And what should be the relative price paid in the purchase of a stallion 16 years old and the same horse at three years old? To what age can a stallion be depended upon for service? Are stallions, as a rule, shorter lived than mares or geldings? Are the colts produced by an aged horse as good as those by a horse in the prime of life? A discussion of the subject through the American Breeder might be interesting and helpful.—A. A. Anderson, Mercer County, Pa.

Questions and Answers

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

A RIDGLING AS A SIRE—Will a ridgling stallion sire ridgling horses and barren mares? There was a ridgling horse stood here and I know of some ridgling colts that were sired by him. I have also been breeding one of his get. I bred this mare all last year and this season up until now and never could get her in foal. I made an examination and could locate but one ovary and it was as large as a man's fist.—Colorado Subscriber.

REPLY—A ridgling sire may produce ridgling horses and barren mares. Either the ovaries or the testicles may be impaired, either partially or wholly. Some stallions sire many defects of this kind while others are not very serious. The ovary you describe would not indicate that it was due to this hereditary ailment, as this defect usually results in an undeveloped condition.

FOUL SHEATH—I am using the capsule system and I use the saline treatment on mares that return. I have had nine-day ones bred with capsule and natural service both come in again; some the 21st and some in four weeks. I cannot tell what is the trouble as I only make five services a week and keep a ring on the horse. I wash the mares out from half to three-quarters of an hour before I breed again. The horse I cannot keep clean. A kind of gluey stuff comes up in sheath and on penis. I have used the bran mash and creoline right along. The skin up in the sheath and on the penis, I find when I pull them and squeeze them that there is little pimples. Then there is some white substance comes out, but don't look like matter. I think it might be pox but am not sure. What is the result when one makes mare bleed when drawing the semen? I have had the doctor test my horse's semen twice and it was exceptionally strong, as I carry it about five and a half miles to the doctor.—Minnesota Subscriber.

REPLY—We fear you are resorting to too much washing of the parts. If the parts are irrigated too much it will excite the glands that are located within the sheath to secrete too abundantly. Apply with a soft cloth the following to the parts once a day: Acetate of lead one ounce, water one quart, mix and apply as directed. You are holding the point of the extractor too close to the mucous membrane while extracting the semen, which is probably the cause of bleeding.

BLACK HAW—I saw an article in your paper saying to feed Black Haw to a mare to prevent abortion. What amount is a dose and how often shall I give it, and how long?—Missouri Subscriber.

REPLY—As a rule the use of black haw is begun a few weeks previous to the period at which abortion usually occurs, and the fluid extract may be given in the feed once a day, giving two drams. Gradually increase the amount as you approach the threatening period until one-half ounce is given in the feed twice a day. Larger doses may be given should the premonitory signs of abortion appear.

HORSE POX—In July 5 number of American Breeder a Missouri subscriber describes the condition of his jack, which is a good description of my stallion. You say it is most likely "horse pox." Now, is this the same disease as dourine of Montana? Horses are being condemned to death for a blood test is given for it. If not, is there any likelihood of a horse's progeny being affected by the disease? How should a mare be treated for it, or can they be cured? I washed my horse in diluted Creso sheep dip. The spots disappeared and were well in three weeks. I did not use my horse while affected. If a horse serves a mare showing horse pox, how soon afterward will his penis become noticeably diseased?—Montana Subscriber.

REPLY—Horse pox is a contagious disease, conveyed during the act of coition, but is not the same as dourine. Animals nearly always recover from horse pox. Local irrigations of the vaginal canal with mild antiseptic solutions is about all that is needed. The progeny is not affected by this disease. You did the right thing in the case of your own horse.

EVADES SERVICE FEES—Will you please advise me what to do in regard to a man for whom I bred three mares last year. He moved to Canada this spring and took the mares with him without me knowing anything about it. My man said two of these mares had colts by their sides and refused the horse after 21 days after he had bred them, and the other was a young mare and refused the horse also after tried over in 21 days, and what I can judge from the general percentage of foals last year, this man must have some colts. What can I do to get my service money?—North Dakota Subscriber.

REPLY—Go to your banker who can furnish you the name and address of a lawyer at this man's town. Write him about the case, giving a description of the mares, and get his advice in the matter.

CURB—I have a good two-year-old filly that has a curb. I first noticed it about one month ago. Don't know the cause. Please advise what to do. There isn't a veterinarian in this part of the country.—New Mexico Subscriber.

REPLY—You do not state whether or not this filly is lame as a result of the curb. The enlargement of even a month's standing is difficult to entirely cure. An application of some blistering agent is in order, which may be repeated in about three weeks. For this purpose the following may be used: Powdered cantharides one ounce, biniodide of mercury 30 grains, vaseline four ounces. Mix all together. Clip the hair from parts and apply the ointment briskly with the fingers for three or four minutes. Permit to remain on for 24 hours then wash off with quite warm water and soap. When dry apply a little cotton seed oil once a day.

MARE ABORTS—I have a mare that is all right to get with foal although she never stays in heat long at a time, but soon after getting with foal she will have attacks like colic. The spells will keep returning until she loses her colt. One colt she was only about two months along, and last fall she was five months or more along before she lost it. She has never had the colic at any other time. Is 11 years old and has lost four or five colts the same way. What is the reason for it? Would a change in the date of breeding from summer to fall be any use in a case of that kind?—North Dakota Subscriber.

REPLY—Better discontinue breeding this mare as you may lose her some time during one of these attacks.

HINNIE BREEDING—I am breeding a stallion to some jennets. Owing to their coming in heat after becoming pregnant, would like to know if a service from a horse, after they are in that condition, will cause them to abort. If so, is there a sure way of knowing when animals are pregnant by examination with speculum, or any other method? To make sure of getting jennets with foal, would it be practicable to use a bulb or metal impregnator and transfer semen from the vagina to the womb in one operation?—New Mexico Subscriber.

REPLY—There is some danger of breeding a small female to a large sire while pregnant. Jennets show signs of heat more often while pregnant than mares. The most reliable way to diagnose pregnancy is by making a rectal examination. Some breeders are able with a speculum, to tell quite certain when a female is pregnant. An instrument can be used for transfering the semen from the vagina to the uterus, but it should first be boiled and cooled down to 100 degrees F. when used.

DEAD MARE—A mare five or six years old, of a low, dumpy build, a trifle thin in flesh; suckling a six weeks old foal, helped to cut [illegible] acres of rye on a hot day (July 2) and was driven three miles to buggy at 6 o'clock p. m. to breed to a three-year-old Percheron stallion. Mare was tested some on way to stallion and showed a little distress upon arriving. Service was made in stall having ground floor and a high ceiling. Mare had not been served this season and was very keen upon the above occasion. The stallion was serving [illegible] and very satisfactorily until about half done when he gave a squeal and quickly dismounted with a [illegible] which was not his custom. The stallion owner said that something must be wrong and upon inserting hand into vagina exclaimed that her temperature was too high, and got his thermometer and found that the temperature in the vagina registered 105, and showed the mare owner the thermometer explaining to him that the temperature should be four or five degrees lower, and that he would not have allowed the stallion to serve her had he thought that her temperature was so high. He advised that the mare be driven home in a walk. The mare owner said that she appeared to be relieved upon reaching home and ate grass in the house-yard for an hour, and because of her temperature and the threatening rain she was put in the stable for the night where she was found dead in the morning. What was the probable cause of death? There was no false entry; mare stood quietly. Stallion made perfect service on another mare for same owner early in the morning of the same day and also made perfect service the following day.—Ohio Subscriber.

REPLY—It would only be a guess on our part as to what caused the death of your mare, but we see nothing about the service of the horse that could be thought responsible. Your mare showed the effects of the warm weather as evidenced by the temperature. As a result of overheat horses frequently suffer from attacks of indigestion and die very quickly, and we should not be surprised if this is what occurred in your case.

RAISING A JACK COLT—Will you please give me some information as to how to raise a jack colt?—Missouri Subscriber.

REPLY—A good prospect (which is the only kind to raise) should be well cared for. A small pasture with good grass and plenty of water should be supplied, if possible. The jennet should be well fed with plenty of good oats, on grass. The colt should be taught to eat oats as soon as possible. The amount should be regulated by the colt—full fed. Wean the colt at about six months of age and never let it see or smell a jennet or a mule. It is usually considered safest to keep jacks out of sight, also. A filly colt should be its only companion. Give them all the oats they will eat, whether there is pasture or not. If not on pasture, alfalfa or good clover hay should be supplied. Every breeder who is raising young animals should have winter pasture of some kind. A little green stuff is very valuable. If this cannot be supplied a crop of carrots should be substituted.

RETAINED PLACENTA—I have a cow that gave birth to a calf a few weeks ago. She cleaned right then but she seems to be torn inside and strains and mattery substance comes from her. What is the best treatment for her? Also, tell me how the afterbirth should be taken from a cow, as it is not always so one can get a doctor. I would like for you to enlighten me as much as possible.—Minnesota Subscriber.

REPLY—It is quite likely that a portion of the afterbirth has been retained and you should secure the services of some competent veterinarian to look after the case for you. We would judge from your inquiry that such a man is available and that you have not employed him. We do not think it advisable to undertake to instruct inexperienced men in removing placental membranes, for it is easy for one who has not been trained

(Continued on page 14).

THE AMERICAN BREEDER

With which is combined

THE STALLION AND JACK NEWS.

A Journal of Live Stock Improvement and Modern Breeding Practices.

FRANK B. GRAHAM and T. W. MORSE, Editors.

Published semi-monthly (on the 5th and 20th of each month) by the

GRAHAM PUBLISHING COMPANY, INCORPORATED,
225 WEST TWELFTH STREET,
Kansas City, Mo.

A BREEDING LESSON.

The writer recently examined the generative organs of 50 heifers from 12 to 18 months of age. Those heifers were very fat and made excellent beef, but upon examination we found about one-half of the ovaries either cystic or otherwise diseased. These cattle had been crowded from the beginning, being on full feed and in a small enclosure, and the greater portion of the time under cover.

It was not the feed that caused this serious damage, but more likely was the lack of fresh air, exercise and sunshine. These are three very important factors in live stock breeding. Had these cattle been placed in the breeding ranks the owner would have been greatly disappointed, as it is likely that a larger per cent of them would have been barren. Another disappointment would have been that the general health of these heifers would have been weak, as a rule. They would have been susceptible to tuberculosis and other infectious disease.

The same morning these heifers were examined, 100 old cows from Western Texas were investigated. Ordinarily these cows under general domestication would have been considered beyond the age of producers, but to our surprise more than half of these cows were pregnant, and the ovaries, as a rule, were in excellent condition; only a few cystic ovaries were present. These cows had been raised and developed in the open. They were large cows showing the blood of good beef breeds. In fact, they were about the same class of breeding as the yearling heifers previously mentioned. These old cows had been well developed. The principal difference that we could find in the management of the two herds was that of fresh air, exercise and sunshine.

The time must come when breeders of live stock must consider these subjects more carefully. The above lesson is only one of many that can be learned by observation. The value of this lesson does not relate entirely to the fecundity of the animals, for the general health is dependant on these three things to a very large degree. The owners of basement barns, barns without ventilation, enclosures either entirely shaded or too small, should seriously consider the above caution especially with growing animals. It has been estimated that three-fourths of the tubercular cases in humans can either be cured or greatly relieved with plenty of nourishment, fresh air and sunshine.

The tuberculosis question is very important, especially with cattle and hog raising. Some scientific men are now contending that the great spread of consumption in the human race is due largely to the manner in which live stock is kept.

BRANDING PERCHERONS.

A reputable Western breeder states that he has been asked to write an article favoring the branding of Percheron horses. He asks us if the branding of Percherons would stop fraudulent registrations.

When it has been proven beyond a question of doubt that a crook has been fraudulently registering Percheron horses for years, and has recently done it, without receiving any punishment, we do not understand how a brand could remedy the condition at fault. A brand may be used just as freely as a fraudulent certificate. A branding iron can be used just as successfully in the perpetration of fraud as can a signature or a seal. In our opinion the only branding that will stop these fraudulent registrations is to brand the crook. Is this branding iron talk another excuse to make breeders forget the crooks?

Since certain political changes have been brought about, a little more justice can be expected. One individual interested in fraudulent Percheron pedigrees has recently forfeited his bond and disposed of his property and fled to Canada, where he can escape punishment. This may be only a starter. Usually where there is so much smoke there must be some fire.

In what other record association has branding iron talk been started to fool the people? Another certain record association did not use the branding iron—it threw out the crooks. Just as long as a few individuals with their underhand methods, protect the crooks, the crooks will be operating either in this country or in Canada.

A DISSATISFIED BREEDER.

An Oklahoma breeder states that he has several young registered draft stallions of a salable age and that it is impossible to sell them at a reasonable price. He says that we are misleading the people in advising breeders to raise this class of stock.

It is first necessary to find a prospective buyer before a sale can be made at any price. This breeder has perhaps been trying to sell his high class animals to his neighbor farmers who do not realize their true value. If he will place an advertisement in a publication that goes largely to a special class of buyers for this particular stock, he should have no difficulty in selling his product at a fair market value. We believe if this individual will place an advertisement in this paper, giving a good description of the stock, stating that he is willing to sell them at their actual worth, he can find plenty of buyers.

The Southwest will be an excellent territory for disposing of high class stallions and jacks this year. We are receiving inquiries continually from our readers concerning better stock and improvement of demand is to be expected from that source. The stallion business requires regular changes. About every four years a stallion is taken to a new home to avoid mating with his fillies. As the country developes a better class of sires are used, displacing the inferior sort. A question for this Oklahoma breeder to consider is, could he find possible buyers out of 40,000 men interested in breeding better live stock. Below is a letter just received, which is similar to hundreds that come to this office. Could any good service be cheaper?

"To the American Breeder:—Find enclosed check for $2.80 in payment of my account for advertisement. The ad sold my Percheron stallion.—J. J. Tschudy, Red River County, Texas."

DO YOU READ THE QUESTIONS AND ANSWERS?

One of the best posted live stock paper men with whom we have ever discussed this matter, stated that the "Question and Answer" department of the American Breeder is the most valuable and comprehensive department of the kind he has ever seen maintained by any paper. We have had letters from hundreds of our subscribers stating that they read the whole department carefully every issue and that they have never read it without finding something they needed to know then, or had occasion to use within a very few days. We have had so many letters of this kind and so many compliments on the department from other publishers and from veterinarians, that we have considered it the most valuable part of the paper. No expense has ever been spared in getting it up and making it reliable, and it has always had first call on space, other good material frequently being omitted to give it room.

Occasionally, however, we get a letter which makes us wonder if this department is really used and appreciated as it should be. One such has just come to the editor's desk. It asks about navel ill. How many times, Mr. Thoughtful Subscriber, do you suppose this subject has been discussed, and questions on this subject answered in the past half dozen issues? We like to have a good many questions on the same subject, because symptoms vary, and the ways in which breeders describe the same symptoms vary, so that by having questions on the same subject from several, every angle of the difficulty is brought out and many more readers are made to understand the trouble.

But here is a man who has let his colts get in a bad way, and is in danger of losing them, apparently for lack of information that he could have gotten a dozen times during the last four months if he had only studied carefully our "Question and Answer" department. This does not look right to us. Can a man excuse himself by saying he is too busy to read up on a matter so vital to any farmer or horse breeder as is navel ill, when he has the information on the best authority, put before him twice each month? Will some of our readers tell us what they think?

THE VALUE OF MORAL INSTRUCTION.

Most educational institutions of the country are now preparing for the coming sessions of school work. Perhaps the most important at this time is the selection of instructors—individuals who will cultivate and direct the moral training of these young minds.

A thorough acquaintance, or the best of references, should be required of all instructors, not only as to their ability but also as to their character. If the instructor has a good moral character it will not be difficult to impart that necessary qualification to those of the rising generation who come in contact with such an instructor. But an instructor supplied with a "yellow streak" will not properly emphasize the necessity for encouraging a cleaner life. An occasional word dropped by one who is supposed to be the living example of a class, might mean the downfall of more than one, later in life. Education and ability are not very valuable when coupled with a crooked character. The responsibility for the rising generation lies heavily upon those who employ the instructors.

HORSES IN HOT WEATHER.

We do not believe the average mare owner appreciates the injury that may befall mares from overheating.

In addition to lessening their value, through placing them in a condition wherein they are not able to do even a fair day's labor on account of being affected by the heat, there are other important points to be considered.

A mare once injured by getting too warm becomes an uncertain breeder as a result. If she has a foal by her side she is quite a menace to it. Such mares suffer from high body temperatures, being often 103 to 106 degrees Fahrenheit, which has an injurious effect upon the foal through the overheated milk. A mare that has been overheated nearly always is affected more or less with indigestion and as a result is apt to have attacks of colic.

Such injuries jeopardize the life of the young, either at foot or in utero.

Much can be done to prevent the overheating of horses, in the way of proper diet and the use of judgment while working. It doesn't pay to overheat an animal for it very materially detracts from the value of that animal. Many men fail to use their brains on hot days, and persist in endangering the lives of valuable horses by expecting as much service as when the weather is cooler. To hitch horses so they can work a little farther apart when worked in pairs (provided the nature of the work will permit), is a sensible idea. In addition to this an occasional drink of cool water, with a sponging of the head, and even the body, gives relief.

Much can be done by way of early preparation in the way of a proper diet. Corn is unsuited for such cases. A diet made up of oats, bran, oil meal, alfalfa, etc., is better.

Best of all is a night run at grass. Freeing the horse from the hot, illy ventilated stalls and permitting it access to the open pastures, gives it an opportunity to become thoroughly cooled out during the night. Besides the grass is easily digested and laxative, serving to correct the disturbed digestion so frequently associated with overheat. Again, the grass favors perspiration which is essential in regulating the heat of the body on distressingly hot days. A closed barn is not a very comfortable place for either man or beast during the extreme hot weather.

Many modern residences are equipped with sleeping porches because the inhabitants do not find it comfortable in a room during a hot night. If it is difficult for a man to be comfortable in a closed room, when he has an opportunity to raise the windows, and properly care for himself, why would it not be a benefit for a work horse to have a sleeping porch also? In order to determine the effect of this argument one has only to visit a barn where the horses are tied in an enclosure, to find that it is too warm for a human to stay there long without much distress.

We believe that team owners would find it profitable to erect a cheap shed-barn without any sides to it, where horses could be cared for at night. This might also apply to other live stock. The Armour Packing Company of this city has a large number of valuable horses. Its barn is equipped with large fans that are constantly in motion. In conversation

with the foreman some time ago, he told the writer that their horses were standing the work much better since this new appliance has been put in. The horses are thoroughly cooled. They rest well, and in order to stand a hot day's work either man or beast must have a good night's rest. Even animals that are not required to perform any actual labor will do better if they can be kept in a comfortable condition.

Whenever an owner discovers that a horse becomes seriously affected from heat it is wise to relieve that animal from service for a time. Turn him to pasture until cooler weather, at which time he will be able to render good service again. To force him to do his proportionate share of the work at this time only invites permanent ruin or loss of life.

MARKING BARREN MARES.

Occasionally men are short-sighted in business propositions. One sometimes hears a stallion owner say that the breeders should be organized in order to keep the service fees high.

In our opinion this should be the thing least considered in any breeding association. One of the most important would be to brand the diseased or barren mares so that they would not be changed from one place to another. It is indeed amusing to hear some men say that they can get any mare in foal, then cite cases that have been given up, in order to encourage the shy breeders to come to their barns.

Those who make a practice of breeding barren and diseased mares by natural service are losing money. A mare that has been bred at a barn for several services will be changed to another place, and at the same time condemn the sire where the mare was formerly bred by saying that the animal was not sure. A majority of the mares that do not get in foal after receiving two or three services from a sire that is getting colts, are usually either defective or diseased, and may require a capsule or a treatment.

An organization might not be necessary. A qualified man who is able to pass on the fertility of these mares and the possibility of making them breeders, might place his private brand on a mare for his own protection where he had an extensive business. He might also have a few friends that might be instructed to look at a particular place on each animal for some mark. The fact is that the individual who wishes to retire his competitor could not employ a better method than to send him the diseased mares. This will eliminate from business such a breeder in the course of time. Some of them have already quit the business because the per cent of foals was too low. We have known of several cases where the diseased mares have been sent to certain breeders. Some breeders (after making a critical examination of the mare) have gone so far as to send her to a competitor with the understanding that if she produced a colt he would pay for it.

It does not take many mares of this kind, in addition to the regular routine losses, to destroy the profits in the breeding business. The usual statement made with a transaction of this kind is that the competitor is not using his stock very heavily, while the operator is crowded at the present time. It is not necessary to state that the mare will not fertilize, but that the chances are against her.

If it was necessary to pay for a few colts one could well afford to do it. There are not many breeders who care to make from 20 to 40 services for one colt. This number of services can be found on nearly every breeder's book on this class of mares at about that ratio. It is not only the loss of services that counts, but loss of the mares that follow these doubtful breeders, and the loss to the community.

We do not know what kind of a brand could be placed on these mares, or whether an organization could be formed for this purpose, but we do know that many individual breeders are sending the shy mares to some competitors who advertise that they can get that class in foal.

JACK SHOW ENTRIES CLOSED.

The last entries are in for our photographic exhibition of mature jacks, the closing date being July 15. About ten states are represented. West Virginia, Indiana, Mississippi and Arkansas have sent only one entry each, but the other states known for the production of good mules, have furnished from two to ten entries each.

There are some famous jacks among the lot—some that have sold for long prices and some that have won prizes in big state fairs. No one can tell which ones these are, however, when the pictures and measurements are published, for neither the name of the jack nor of the owner will appear. Each jack has been given an entry number, as the entries were received, and this number will be published with the photograph. The judges will make their awards by these numbers and neither they nor the general public will know to whom the jacks belong until the awards are published. Then we will also publish the list of entry numbers along with the names of the jack and owner to correspond with each. Be sure to save the issue in which the pictures appear until you get this list.

RECOGNIZED REGISTERED JACKS.

The demand for an institution that registers the description and breeding of superior jacks shows that it is just as necessary as a record association for any of the other live stock breeds. A large patronage by those who own superior animals is evidence that the conduct of a particular registry association is meeting with their approval.

From many different states and sections come the reports that the Standard Jack and Jennet Registry of America is to have even a greater growth than it has had in the past. The stallion inspection boards are finding that this association is of a character fully worthy of their recognition, and Wisconsin, the first state to pass a stallion registration law, has placed this association on its list of recognized live stock records. Breeders are finding it not only profitable to record in this registry, but it may only be a question of time until nearly all the jacks must be registered in it or be classed as grade or mongrel stock. For the small expense involved we cannot understand why all the jack stock that can meet the requirements should not be registered with this association. There will be some breeders who will put it off until it is too late.

This association does not publish false statements, as another association has been doing when it stated that it was recognized by the government. No American live stock record association is recognized by the United States government. Any one wishing to verify this statement should write to the Bureau of Animal Industry at Washington, D. C., and find out for himself. We predict a great future for the Standard Jack and Jennet Registry of America.

BEFORE YOU GO TO A *Business College*

I want to talk to you either personally or by letter. I want to tell you what I will do for you. I want to tell you something of the aims, aspirations and ideals of my institution, and the work I am doing for **better business training.** I want to tell you how I will help you. No matter where you live—no matter what your financial condition. If you are earnest, ambitious, honest and really want to learn **Shorthand, Typewriting, Bookkeeping, Penmanship, Salesmanship** or other **Commercial Branches,** write me today for my **new catalog** and let me tell you how I can help you realize your ambitions on terms to suit yourself. Students assisted to a place to work outside of school hours for room and board. Address me personally. **C. W. RANSOM, Pres.**

RANSOMERIAN BUSINESS SCHOOL,
911 Minor Bldg., 10th and McGee,
Kansas City, Mo.

SHORTHAND IN 30 DAYS

We absolutely guarantee to teach shorthand complete in only thirty days. You can learn in spare time in your own home, no matter where you live. No need to waste months as with old systems. **Boyd's Syllable System** is easy to learn—easy to write—easy to read. Simple. Practical. Speedy. Sure. No ruled lines—no positions—no shading, as in other systems. No long list of word signs to confuse. ONLY NINE CHARACTERS to learn and you have the entire English (or any other) language at your ABSOLUTE COMMAND. The best system for stenographers, private secretaries, newspaper reporters, lawyers, ministers, teachers, physicians, literary folk and business men may now learn shorthand for their own use. Does not take constant daily practice as with other systems. Our graduates hold high-grade positions everywhere. Send to-day for booklets, testimonials, guarantee offer, etc.

Markets Show No Uneasiness

Demand Crowds Supply in Most Lines. Range Stock Sales Only Horse Market Feature. Hogs Pass $9.00 Again. Wool and Mutton Up. Cattle Situation Strong.

The principal trade in equines for the next thirty days will be in the northwest. It will be principally the supply from the range country, but will reach well into the corn belt and some of the best horses will be eligible to the Eastern trade. July 15 and 16, close to 1,500 range horses were sold in Omaha, and sales of various dimensions extended out through the west as far as Oregon. The general opinion of the range horse is far below its actual condition, both in size, disposition and capabilities. Some people think range horses of today are the cow pony type of twenty years ago; not so. In the past ten years the size of the western horse has been graded up by the use of heavy stallions. His disposition has been changed completely, his usefulness increased materially and price increased many fold. It is not uncommon to find 1,400 to 1,600 pound geldings on the range, and there are many breeding establishments in the Northwest that use the best blood available. The plan of handling the horse in the Northwest is to let him grow up on the range, and this makes him a serviceable animal when properly broken. There are still some wild horses in the Northwest, undersize and inbred, but that condition is being changed rapidly by the good prices which better horses bring. The professional horse trapper in Oregon and Washington is losing his profession for lack of supplies. Prices in these sales have shown the range of $40 to $250, and the wide difference in prices tells the difference in quality. Another decade of continued upbreeding will bring a still greater improvement in quality, and make horses in the Northwest compare favorably with other sections of the country. They will not be known as range horses then.

At interior markets trade has been about normal for the season of the year. The week ending July 5 was the dullest of the season, but such a condition was expected. In the past ten days the movement was stimulated by increased demand and supplies. Demand, of course, is still low compared with April or other busy seasons of the year, but it is still fully normal for mid-summer. The East has taken a few horses; some mules have gone South, and some harvest horses have gone into the spring wheat belt of the Northwest. Dealers say that trade from now on will be quiet, until the latter part of August, when the South will begin buying. On the basis of present condition of the cotton crop fall trade in mules will be large.

Prices quoted now are largely nominal, and $10 to $20 a head below April quotations. The general supply lacks quality and prohibits an actual test for choice kinds. The common light weight classes are fully equal to requirements.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Draft, choice, 1600 lbs. up	$230@275
Drafters, fair to good	150@225
Chunks, good to choice	125@165
Chunks, fair to good	100@125
Expressers and light draft	60@120
Plain workers	40@ 85
Southerns, good	125@150
Southerns, plain to fair	65@120
Plugs.	20@ 55
Mules—	
13 to 14 hands	$ 75@120
14 to 15½ hands	110@150
15½ to 16 hands	140@185
16 to 16½ hands	190@285

Increased Movement of Cattle.

The season of larger supplies is at hand in the cattle market. Monday the five Western markets reported 52,000, about 40,000 of which were in Kansas City and Chicago. Next Monday is expected to show a still larger number and according to advance reports, loading out of some Kansas pastures will begin unless rains come soon. The increase has been entirely in grass fat cattle and the choice to prime fed grades are showing more than a seasonable scarcity. Heavy beeves which were discriminated against a few weeks ago, are now selling readily and well up to the season's high level. Good steers are also in active demand, but the plain kinds have been discriminated against to the amount of 25@35 cents. The spread in prices is widening in both directions. From the present outlook it appears that prime beeves in August and September will draw attractive prices, and should the corn crop suffer material impairment, October will bring out some $10 steers. In the past few days extreme high temperatures in the West with hot winds have been hard on both pastures and cattle. From below the quarantine line more than 450 car loads of cattle were received in Kansas City and St. Louis last Monday. They sold at only 10 to 15 cents lower prices and in the following days the market showed a steady tone. Grass cattle may go some lower than at the present time, but there is nothing at this time that indicates a sharp price reduction. Demand is too close to the supply, and has been for some time past, to permit of any bargain deals.

A big line of cattle fed corn on grass in Western Missouri counties is being marketed at $8.50 to $8.90. The yearling class made the top price, though 1,400 to 1,600 pound steers sold up to $8.85. In Chicago the top price was $9.15. Most of the native fed steers are selling at $8 to $8.75, and Western steers $7.40 to $8.25. Cattle from below the quarantine line sold at $5 to $8.15. Those below $6 were common grassers and those above $7.50 had been fed cotton seed cake on grass. The movement from that section has reached maximum proportions for this season, and from now on will show a shortage.

Quotations for the various grades of killing steers are as follows:

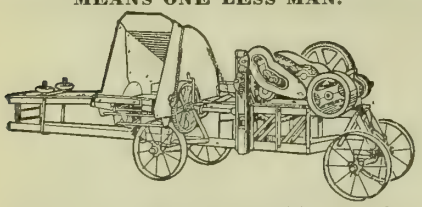
Prime corn fat steers	$8.75@8.90
Good to choice steers	8.25@8:70
Fair to good steers	7.75@8.20
Common to fair steers	6.50@7.70
Meal fed, choice	7.75@8.25
Meal fed, common to fair	6.50@7.75

Slight Increase in Butcher Cattle.

Medium to fair grades of butcher cattle have become more plentiful within the past two weeks, but the choice to prime kinds have been scarcer than at any previous time this year. There has been a good demand and except for 10 to 20-cent fluctuations in prices, the market is about the same as two weeks ago. Killers are finding it as hard now as at any previous time this year it get low grade beef at much price reduction. Grass has increased the supply to some extent, but for this season of the year all she stuff is comparatively scarce. Packers are gathering in all the canners available, but so far that number has not been enough to cause much activity in the canning departments. Unless weather conditions force marketing this department will have meager supplies the entire season. Veal calves are selling readily, though about 25 cents lower than two weeks ago. Bulls show a wide price spread, but quality also includes great variety.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice.	$6.50@7.15
Fair to good	5.25@6.40
Common to fair	4.50@5.20
Canners.	3.65@4.40
Heifers—	
Choice fed	8.00@8.75
Good to choice	7.50@8.00
Plain to fair	6.35@7.45
Common.	5.25@6.45
Veal calves	6.00@9.25
Bulls.	3.75@7.50



Some Decline in Thin Cattle.

Larger supplies in keeping with the season, and a moderate let up in the demand on account of the high prices that had existed up to a few days ago, sent prices for stockers and feeders down 25 to 35 cents. At this decline the dullness which was apparent in the market on the down grade was eliminated and demand improved moderately. Some feeders have been waiting for a material reduction in prices, before buying, and the only factor that will make low priced feeders in the next few months will be drouths and crop failures. With a seasonable crop more thin cattle can be cared for than will be offered. Practically no stock calves are coming and stock cows and heifers continue scarce.

AUTO-FEDAN

(Self Feeding Hay Press.)

MEANS ONE LESS MAN.

Two men can operate this machine. Bale as much as 3 will with any other. Can furnish with 12-horse engine mounted on same frame, direct gear drive, weight only 4,000 lbs. The most compact and nicest machine there is out. Write for catalogue.

WITTE Engines
1½ to 40 H.P.

Cost Less!—Worth More!

Here's my new offer, **direct** from my factory to power users everywhere. **No dealer's profits.** Think of it! The **highest** standard engines for the **lowest** prices. Nobody else has these two things to offer together.

DEPENDABLE POWER
From Gasoline, Gas or Oil

WITTE engines have set the quality standard for 26 years. Better today than ever. 1½ to 40 H. P. stationary and portable sizes. All have detachable cylinders, vertical valves, four ring pistons, electric ignition and other exclusive merits, without which no engine can now be high-grade.

Start Without Cranking

The **WITTE** had that advantage 20 years ago. You don't even have to press a button. Don't be satisfied with any out-of-date engine. Don't risk any untried, new fangled devices with high-falutin' names. Be safe and sure. Let me show you

How To Judge Engines

My new book shows the secrets. All made plain as A. B. C. It gives my 5-year guarantee and 60-day free trial plan. Tells you how to be safe in your engine selection, even if you don't pick a WITTE. It took me 26 years to write it, but you can get it quick—just send me your name—no money—and it will come by return mail.

ED. H. WITTE, WITTE IRON WORKS CO. 2555 OAKLAND AVE., KANSAS CITY, MISSOURI.

BINDER Attachment with Corn Harvester cuts and throws in piles on harvester or winrows. Man and horse cuts and shocks equal with a Corn Binder. Sold in every state. Price $20.00. W. H. BUXTON, of Johnstown, Ohio, writes: "The Harvester has proven all you claim for it; the Harvester saved me over $25 in labor last year's corn cutting. I cut over 500 shocks; will make 4 bushels corn to a shock." Testimonials and catalog free, showing pictures of harvester. Address

A NEW BOOK FOR FARMERS

TRACTION FARMING and TRACTION ENGINEERING

GASOLINE
ALCOHOL
KEROSENE

By JAMES H. STEPHENSON, M. E. Author of "Farm Engines," "The Young Engineer's Guide," etc.

This new hand-book contains all the latest information of the HOW and WHY of Power Farming.

In Three Parts

PART I. FARM TRACTORS—Full details of construction and operation—Fuels—Lubrication—Ignition—Troubles—All leading makes of tractors described and illustrated.

PART II. Water Supply Systems for Farm Homes—Electric Light for Farm Homes.

PART III. THE SCIENCE of THRESHING—All leading makes fully described and illustrated.

Just the book you need to help you out of all difficulties in connection with modern farm machinery.

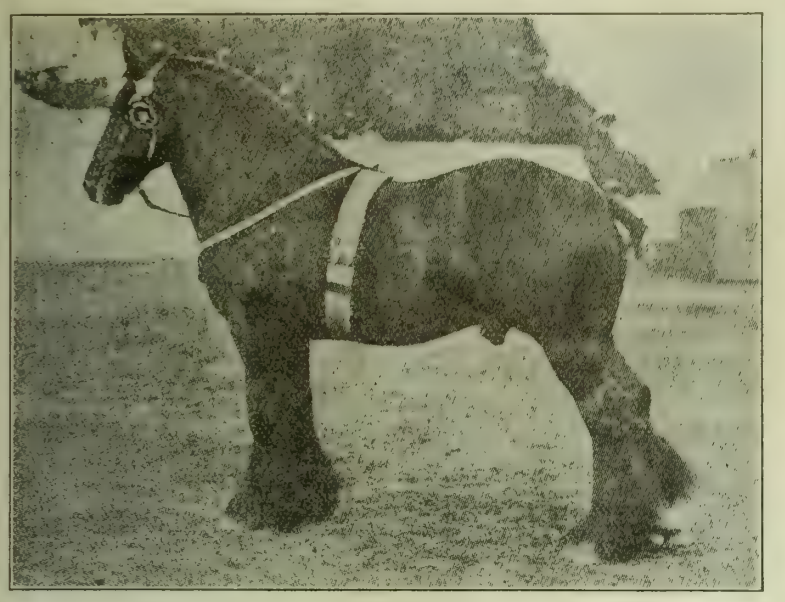
12 mo. 330 pages. 151 illustrations. Cloth.

SENT POSTPAID TO ANY ADDRESS FOR **$1.50**

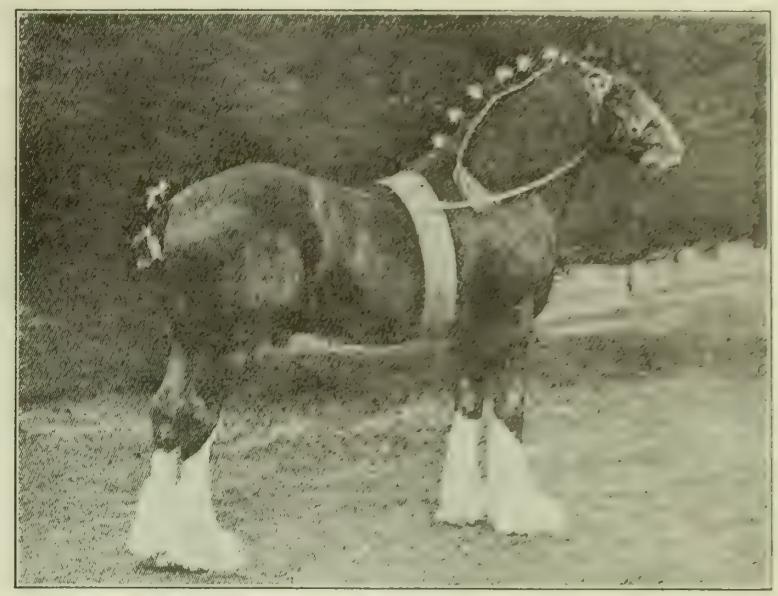
Address orders to Book Dept., American Breeder, Kansas City, Mo.

GUNN'S 2-HORSE, GUIDER ROAD BUILDER

Fair associations, clean the pole, and build up the turns.



Sold on 15 days trial. Guaranteed to move more dirt with less draft than any machine made. Two levers, one tilts the blade any angle, one raises and lowers the rear end of blade, leaving the dirt where you want it, crowning road bed smooth.



Made in 2 sizes
7-ft blade, $20
10-ft " $25
7-ft weighs 200
10-ft " 250

Stock heifers	4.75@ 6.50
Milch cows	35.00@90.00

Nine Dollar Hogs Again.

Since the first few days this month $9 and better has been the top price for hogs at Eastern markets. Wednesday the top price in Chicago was $9.37½, and throughout the West as high as $9.05 was paid. Prices now are at the highest level this season, and to all appearances will continue so until new corn begins to show in pork. Then prices will depend largely on the crop of corn grown. Farmers have had a good year thus far with young stock, and from present indications, the winter's packing season will be fairly well supplied. At present the market shows a strong mid-summer shipping demand, and packers have temporarily lost control of the situation. For two months past they have been trying to keep hog prices below $9, and from present demand the supply will continue below requirements for some time. The quality of the hogs coming is good. There are practically no light weight pigs, or any sick hogs. The top price in Kansas City today was $9.05, and in Chicago and St. Louis, $9.37½.

The following table shows prices for hogs in Kansas City in the past two weeks:

Mon., July 14.	$8.75@8.87½	$8.70@8.92½
Tuesday.	8.80@8.95	8.80@9.00
Wednesday.	8.85@9.05	8.75@8.95
Thursday.		8.70@8.90
Friday.		[illegible]
Saturday.		[illegible]

The following quotations are for hogs:

Choice, 25[illegible] lbs	$8.[illegible]
Choice, 20[illegible] 245 lbs	8.[illegible]
Medium weight	8.[illegible]
Light weight	8.[illegible]
Common to fair	8.00@8.80
Stags.	7.[illegible]
Boars.	4.50@6.75
Bulk of sales	8.90@9.00

Fluctuating Sheep Prices.

Lambs in the West today sold up to $8.50, and as high as $8.75 in Chicago. This marks an advance of more

CATTLEMEN.

British Columbia bunch grass range land. We can locate you on Government land, 21 year lease with option to purchase. Have several ranges with cattle for sale. **The Wright Investment Co., Ltd., 1110 Dominion Bldg., Vancouver, B. C.**

Missouri Stock Farm

of 400 acres of smoth, black land; never failing water; 100 acres in fine timber and pasture; well improved. Big fine house and barns; close to school and a good railroad town; located 100 miles south of Kansas City. This farm must be sold to settle an estate. Priced cheaper than land adjoining it of same quality. A snap for any one wanting a No. 1 stock farm.

HOMESEEKERS AND INVESTORS.

We have 30,000 acres of choice, smooth, rich, irrigable alfalfa land, that we are selling in parcels of 160 acres and upward, at only $15 per acre; one-third cash, four years on balance at six per cent. One crop will pay for land, and installing irrigation plant. We guarantee the water supply. (Fine crops raised without irrigation.) Railway fare refunded to purchasers of 160 acres and upward.

Also a choice list of all size East Kansas farms in Shawnee County, near Topeka, and only 65 miles from Kansas City. Here are a few samples, viz.:

240 acres, good improvements, $55.
320 acres, fine improvements, $75.
160 acres, good improvements, $65.
70 acres, good improvements, $75.
160 acres, good improvements, $150.
77½ acres, good improvements, $90.

Five or seven years' time on one-third of purchase price, if desired.

Two sections of choice alfalfa land; a part seeded to alfalfa. Price only $60 per acre. Terms, one-half on any kind of clear trade; $15 per acre cash; time on balance. Address,

J. E. THOMPSON
(The Farmer Land Man),
Tecumseh, Shawnee County, Kansas.

Irrigated Farm Land

With Abundant Water Supply.

Grazing Land (Watered) and Timber for sale in Southwest Colorado. Irrigation facilities here are unexcelled and this has long been Colorado's best live stock section.

Fine, moderate climate; no extremes; tornadoes unknown.

155 acres fine private water right, 2½ miles from Mancos; 30 acres in meadow, timothy and red top. Alfalfa, meadow, grain land, small orchard. Good six room house just been remodeled. Hay barn 40x56. Horse barn, cow sheds, chicken house, shop, granary, ice house, etc. Good fence; $55 per acre; a bargain.

160 acres; good house; barn, cross fences; chicken house; sheds, etc.; four shares in storage system besides fishing in waste water. Four acres in cultivation. New farm; fine land; four acres in orchard; $5,000.

160 acres four miles from town; good small house; barn; fenced; partly under cultivation; fine land; $2,000.

Raw land, agricultural and grazing at $5.00 per acre.

W. L. Morse, Mancos, Colorado.

than $1 a hundred pounds, compared with the low point ten days ago, and well up to the season's average. Prices all season have shown wide fluctuations, and the trade believes extreme price movements will occur. The stock and feeder movement is just beginning. Choice lambs are quoted at $8 to $8.50, wethers, $4.75 to $5.50, and ewes, $4.50 to $5.

FERTILITY AND A ONE-CROP COUNTRY.

To the American Breeder:—When Illinois and Wisconsin, Minnesota and Dakota and other western states were put under the plow, the chief crop was wheat. After fifteen or twenty years of wheat growing in southern Wisconsin, the crops diminished seriously and about war time, the yields ran so low because of diseases that wheat growing was abandoned as a failure. After almost a generation of dairying and the exclusive reliance upon corn, oats, barley and clover, wheat was tried again and the yields are now larger than in the pioneer days. This offers a parallel to the growing of potatoes in southern Maine in the earlier days, their virtually going out and now their larger production again.

After the experience of 1911 and 1912 the potato growers of many regions in the Rocky Mountain states will do well to consider if they have not already reached for the time being at least, the passing of their crop. Persistence is a good thing, but not always better than wisdom.—C. L. Fitch, Colorado Agricultural Experiment Station.

TERRITORY NOW UNDER SCABIES QUARANTINE.

A revision of the scabies quarantine rules and orders of the U. S. Dept. of Agriculture, was recently issued by the new secretary, D. F. Houston, and went into effect. This is of interest to all cattle owners or dealers in the states of Montana, Nebraska, Colorado, Oklahoma and Texas. In some sections the quarantine is lifted, but remains in effect in the following described territory, under B. A. I. Rules and acts of congress mentioned in the closing paragraph:

In Montana, the counties of Valley, Blaine, Hill, Chouteau, Teton, Cascade, Musselshell, and Yellowstone.

In Nebraska, the counties of Sioux, Scotts Bluff, Boxbutte, Dawes, Sheridan, McPherson, Grant, Cherry, Hooker, and those parts of Keith, Garden, and Morrill counties lying north of the North Platte river.

In Wyoming, the counties of Laramie, Platte, Goshen, Converse, Niobrara, and Natrona.

In Colorado, the counties of Logan, Sedgwick, Phillips, Yuma, Washington, Morgan, Kit Carson, Cheyenne, Kiowa, Prowers, Baca, Bent, and Otero, that part of the counties of Pueblo, Huerfano, and Las Animas lying east of the Eighth Guide Meridian West; that part of the counties of Weld and Adams lying east of the Union Pacific railroad from its intersection with the Colorado-Wyoming state line, southerly to its intersection with the northern boundary of Denver county; that part of Adams, Arapahoe, Elbert and Lincoln counties lying north and east of the Union Pacific railroad from its intersection with the eastern boundary of Denver county, southeasterly to Limon, Colo.; and that part of Lincoln, Elbert, and El Paso counties lying south and east of the Chicago, Rock Island & Pacific railway from Limon, Colo., southwesterly to its intersection with the Eighth Guide Meridian West.

In Oklahoma, the counties of Cimarron, Texas, Beaver, and Harper.

In Texas, the counties of Dallam, Sherman, Hansford, Ochiltree, Lipscomb, Hemphill, Roberts, Hutchinson, Moore, Hartley, Oldham, Potter, Carson, Gray, Donley, Armstrong, Randall, Deaf Smith, Parmer, Castro, Swisher, Briscoe, Hall, Floyd, Hale, Lamb, Bailey, Cochran, Hockley, Lubbock, Crosby, Garza, Lynn, Terry, Yoakum, Gaines, Dawson, Border, Howard, Martin, Andrews, Nueces, Cameron, and Willacy.

The effect of this order is to release from quarantine the remainder of the states of South Dakota and New Mexico; the county of Fergus, in the state of Montana; and the county of Thomas in the state of Nebraska. It also includes in the area placed under quarantine for scabies in cattle in the state of Wyoming the recently organized counties of Platte and Goshen, formerly part of Laramie county, and Niobrara county, formerly part of Converse county; and in the state of Nebraska, that part of Garden county north of the North Platte river, formerly part of Deuel county, these areas having been already quarantined under the former county designations.

It is ordered by this rule 2, revision 4, under the authority and discretion conferred upon the Secretary of Agriculture by section 3 of the act of congress approved March 3, 1905 (33 Stat., 1264), that cattle shall be moved from the quarantined area of any state to any other state or district only in accordance with the regulations of the Secretary of Agriculture designated as B. A. I. Order 143, promulgated March 22, 1907, and effective April 15, 1907, and amendments thereto.

RINGWORM IN CALVES.

To the American Breeder:—This is a skin disease that appears most frequently during the late winter and early spring. Its presence is shown by the appearance of scabby areas that vary from half the size of a penny to that of a dollar, and even larger. The hair falls out and the surface of the scabby area is covered with a fine white scurf. It shows oftenest about the calves' heads and necks, but may also appear on any part of the body.

Ring worm is caused by a small parasite that burrows in the skin. Its contagious nature is well demonstrated by the fact that the diseased animals spread it by rubbing against others that are healthy. The fact that heads and necks come in frequent and close contact while the calves are pushing and crowding about the mangers explains why the disease appears oftenest on these parts.

Treatment is simple and effective, requiring but a short time for complete cure in all ordinary cases. Tincture of iodine applied to the scabs with a suitable brush or swab several times, at intervals of several days, is all that is required. When the disease encircles the eyes, care must be taken to avoid getting the medicine into them.—Dr. C. C. Lipp, University Farm, St. Paul.

ADDITIONAL PACKING HOUSE INSPECTION.

Secretary of Agriculture Houston has designated three experts in veterinary science, meat inspection, and public sanitation to inspect and report upon meat-packing establishments operating under federal supervision at various points in New York, Massachusetts, Connecticut, Missouri, and Illinois. It is the purpose of the secretary to extend this work, and to secure for these inspections the leading authorities in the country, with the idea that such action will foster confidence of the public in the meat inspection work. Those already authorized are as follows:

Dr. W. T. Sedgwick, professor of bacteriology and sanitary engineering, Massachusetts Institute of Technology, Boston; Dr. V. A. Moore, professor of pathology, New York State Veterinary College, Cornell University, Ithaca; Dr. J. W. Connaway, Missouri Agricultural College, Columbia, Mo.

MILLION DOLLAR STOCK YARDS IMPROVEMENT.

G. R. Collett, vice-president and general manager of the Kansas City Stock Yards Company, has announced plans for improvements at the Kansas City yards to cost $1,000,000. The changes decided on include the following:

Moving the quarantine yards from the west bank of the stream to the north part of the yards, north of the Union Pacific and Missouri Pacific tracks.

The rebuilding of the present Stock Yards bridge across the Kaw river at a point further upstream.

The rebuilding of the hog yards so as to provide 2 and 3-story covered pens in place of the present one. The new pens to be made as near as possible fireproof.

The construction of a subway un-

CATTLE.

GOOD SHORTHORNS.

Practical cattle for both beef and milk. Just the kind the farms of the country need, and with breeding and conformation to make show cattle if you want them. I show my breeding stock successfully, but no stock is ever crowded enough to hurt it.

Pleased to show stock, quote prices and answer inquiries at all times.

C. H. White, Burlington, Kas.

JOHN R. TOMSON, Dover Ks.

My herd of Shorthorns is now at the home farm. Gallant Knight's Heir in service. Several good, strong, fleshy bulls ready for service now. Scotch and Scotch-topped.

SCOTCH SHORTHORN BULLS.

For sale; reds and roans. Baron Douglas 372812 is an extra good, 17 months, low down, red. Also have some good Scotch topped. **L. C. SHEPARD, IRWIN, IOWA.**

HEREFORD BULLS

for sale. Two registered Hereford bulls, 14 and 15 months old. Also pure bred Poland China pigs. Address,

JOHN W. CAROLAN, BOONEVILLE, ARK., ROUTE 3.

COLORADO ANGUS.

R. R. Lucore, Arriba, Colo., breeder of Aberdeen Angus cattle. Stock of both sex for sale. Inspection and correspondence solicited.

THE INAVALE STOCK RANCH.

breeders of full blood and high class Aberdeen Angus cattle.

G. F. LUCORE, Prop., Arriba, Colo.

HOGS.

TEN BOARS AND SEVEN BRED SOWS

to farrow in October, 1913; of the best breeding. Pure blacks; large; growthy; vigorous hogs. Pedigrees furnished.

O. T. RARICK, Lamont, Okla. R. R. 2.

WE SHIP C. O. D.

and prepay express charges, pure bred Chester White hogs and Shropshire sheep.

B. M. BOYER & SONS, Farmington, Ia.

O. I. C. BOARS

ready for service at $25 while they last. Eligible to register. **WM. H. REID, OHIO CITY, OHIO, R. R. 3.**

PURE BRED DUROCS.

Pigs four months old; eligible to register. Excellent blood lines; pedigrees furnished, tracing to some of the most noted hogs of the breed. **J. W. CAMPBELL, FAIRPOINT, OHIO.**

PURE BRED MULE FOOT HOGS

for sale. Spring pigs of both sex. Price $15 and $25 apiece.

H. WARREN, BROWNSBURG, HENDRICKS COUNTY, IND.

SHEEP.

PLATTE RIVER HAMPSHIRE FARM.

Highest quality Hampshires. Former home of Pat Maloy.

R. B. STEELE, Maloy, Iowa.

POULTRY.

FOR SALE.

Full blood partridge Wyandotte hens and cockerels. Have young ones that I will price right. Also one big Poland boar, 1 year old. **W. F. BURNETT, VERGENNES, ILL.**

DOGS.

SCOTCH COLLIE PUPS

from good working dogs. Sir Rolum and Lady Marie at head of kennel.

MONROE NEWTON, Maloy, Iowa.

ENGLISH BULL DOGS

for sale. Two good brood bitches; splendid mothers; never any trouble whelping. Due in season in a short time. Have others; need room. Priced very reasonable. Registered. Photo and description on request.

HAL C. SIMPSON, Denison, Iowa.

der the tracks of the Union Pacific and Missouri Pacific for railroad cars.

The placing of more tracks along the east bank of the Kaw river so more cars can be placed at the loading dock.

SOUTH SELLING TOO MANY COWS

During the past twelve months buyers have been active in Louisiana, Mississippi, Alabama, Georgia and Florida, purchasing cattle to be shipped to the Middle Western markets as either canners or stockers. The prices paid for canners during this period have been so high that thousands of cows and heifers have gone to the shambles which should have been retained on the farms for breeding purposes. This is especially noticeable when the receipts of Southern cattle at the St. Louis market for the last twelve months are compared with those for any previous period of similar length. The receipts of Alabama, Missouri and Louisiana cattle at that market have almost doubled during this period.

Since February 1 buyers from the farms and ranches of the West have been scouring the Gulf states in search of breeding stock. A few years ago this class of cattle would have been scorned by the Western ranchmen as breeding stock, but with the shortage of cows for breeding purposes the ranchers are glad to get these cheap cows, to which they will breed good beef bulls. The halfbreeds resulting from this mating make fairly desirable beef animals.

Several thousand cattle have already been sent from these states to Texas, Oklahoma and Kansas, and some of them are said to have been shipped as far as Montana.

Recently there were perhaps more cattle unloaded at one time in Birmingham, Ala., for feed, water and rest while enroute to the Western ranges, than have ever been seen in that place before in one day. Georgia and Florida are sending out thousands of these native Southern cattle at the present time at prices ranging from $15 to $23 a head for mature animals. A shipment of 40 carloads of cattle was recently made from Osceola county, Florida, in one day. They were shipped to Kansas via Oklahoma City. The cattle were dipped in arsenical solution before loading, to free them of ticks,, and were to be dipped again on arrival at Oklahoma City before going above the federal quarantine line.

Some people of the South seem glad that these cattle are being shipped out, as the number of scrub cattle is being reduced and the South will get better cattle as a result. They do not look far enough ahead, however, or they would see that if the shortage of cattle is such as to cause buyers to come from the far West to buy these scrub cattle for breeding purposes, the chances of southern farmers refilling their pastures with good cattle are indeed small, for where are these good breeding cattle to come from at a reasonable price? The best and most profitable way of getting good cattle throughout the South is to breed up the native cattle by the use of purebred bulls, and by castrating all scrub bulls at an early age.

A SILO TRAIN.

To show western Kansas farmers the advantages of silos—how to build the various types, how to fill them properly, and how to feed silage, the Rock Island railway and the Kansas Agricultural College will run a silo train in western Kansas next month. A flat car will carry models of different types of silos and of silo machinery. Opportunity will be given everyone to examine these carefully. Experts from the agricultural college will give lectures at every stop.

Quadrupling a Wheat Income

Perfect Soil Preparation Added 35 Bushels Per Acre to Yield, and $17.60 Per Acre to Excess of Crop Value Over Cost of Preparing Soil.

To the American Breeder: The thirteen bushel average yield per acre for Kansas could be doubled and even tripled, if farmers would change their methods of culture a little, particularly in the preparation of the land for sowing. That this is true is proved by one of the Kansas Agricultural College's largest experiments, just closed, in which land prepared the easiest way—disked at sowing time, but not plowed—yielded only nine and one-third bushels to the acre. The same kind of wheat, grown on the same kind of soil but in rotation and on a seed-bed made the right way—plowed seven inches deep July 15—produced forty-four and two-thirds bushels to the acre.

This striking difference in yield—thirty-five bushels—was not due to luck or favorable season or anything of that sort. And therein lies the value of this test, which, President Waters says, shows some of the most important results of any experiment in recent years. The big yield was due wholly to the method of preparing the land before seeding—a method which would not be impracticable for any farmer in the state. The cost of preparing this right kind of seeding bed was only $4.85 an acre, which left a profit of $30.88 an acre over the cost of preparation.

The value of early plowing was shown emphatically. Of two fields prepared and seeded exactly alike, two months apart, the one plowed July 15 yielded double the number of bushels of the field plowed September 15. This was on land continuously cropped to wheat. The largest yields were obtained from land on which wheat was rotated with corn and oats. These results were obtained from land on which wheat was rotated in with corn and oats. These results were obtained from wheat grown this year in rotation:

Land plowed September 14, three inches deep, produced 25½ bushels per acre, valued at $18 above cost of preparation.

Land plowed August 15, seven inches deep, gave 41 bushels per acre, from which there was left $29.37 after paying $3.55 for cost of preparation.

Land plowed July 15, three inches deep, have a yield of 44 bushels per acre, cost $4.35 to prepare, leaving a return of $30.91 after paying for the preparation.

Land plowed July 15, seven inches deep, produced 44 2-3 bushels per acre, the highest yield in the experiment, cost $4.85 per acre for preparation and returned $30.88 per acre over cost of production.

Land plowed July 15, twelve inches deep, with the Spalding deep tillage implement, cost $8.10 per acre for preparation and produced 44 bushels of wheat per acre. The crop when sold returned $27.10 per acre above the cost of preparation.

And here are some of the results obtained on land cropped continuously to wheat:

Land disked at seeding time, but not plowed, produced 9 1-3 bushels of wheat per acre and returned $5.51 after paying for the cost of preparing the ground.

Land plowed three inches deep September 15 (a common practice among farmers) and prepared for seeding at a cost of $2.40 per acre, produced 16 2-3 bushels per acre, leaving $10.71 after paying for cost of preparation.

Land plowed seven inches deep in September, at a cost of $2.90 per acre to plow and prepare, made a yield of 17½ bushels and a return of $11.14 over cost of preparation.

Land plowed August 15, seven inches deep, worked thereaffer sufficiently to kill weeds and preserve moisture, yielded 32¾ bushels per acre—cost of preparation, $3.55—leaving $22.71.

Land plowed July 15 (the right time), three inches deep (too shallow for best results) produced 21½ bushels of wheat per acre, leaving $12.90 above cost of preparation.

Land plowed July 15, seven inches deep, produced 35 bushels per acre, the highest yield of the continuously cropped plots, cost $4.85 to prepare the land and returned $23.11 above cost of preparation.

Land listed July 15, five inches deep, ridges split August 15 (double listing) gave a yield of 29½ bushels per acre, valued at $19.82 above cost of preparation.

These results obtained this year are corroborated by similar striking variations which have occurred in three consecutive years.—Kansas Agricultural College.

NATIONAL EGG-LAYING CONTEST

Three American hens and three British hens are in a close race to be the first to reach the 200-egg mark for the first eight months of the National Egg Laying contest at Mountain Grove, Mo. An American hen has only ten eggs to lay in fifteen days to make a record of 200 eggs in eight months. All these hens have made a better record so far than Lady Showyou had made at this time last year. The leading pen record thus far this year is about 200 eggs ahead of the leading pen record at this time last year. The English pen of S. C. White Leghorns is 259 eggs in the lead of its nearest competitor. Two of the hens in this pen did not lay an egg in June, and if this continues, some of the other pens may yet easily overtake them.

June was a scorcher in Missouri. Several deaths were reported in different sections of the state as a result of the heat. It was, of course, also hard on the hens. We had 133 broody contest hens in broody coops at one time that month. Thirty-eight were put up one day and twenty-five another, and such a large per cent being broody at once cut down our egg yield for June. Other contests in which nearly fifty per cent of their pens were composed of Leghorns, had less broody hens, of course, and made a little higher average for June than we did. Our total yield for June was 10,411 eggs, and the grand total to date is 70,386 eggs. The Leghorns in the North American contest at Storrs, Conn., had made about the same average up to June first, as had the Leghorns in the Missouri contest. The larger breeds in Missouri had made little higher averages than the same breeds in Connecticut, as a rule. At the present time, the records are very nearly the same on the average.

The highest twelve pen records to July 1 (being the records of ten hens or pullets for the previous seven months and a half), are as follows:

Pen No.		Eggs.
2.	S. C. White Leghorns, Eng.	1529
19.	Silver Wyandotte, Ia.	1270
57.	Black Langshan, Mo.	1248
20.	White Wyandotte, Ark.	1222
30.	Buff Wyandotte, Vt.	1212
33.	Barred Rocks, Ill.	1192
11.	Black Minorcas, Ia.	1190
26.	Buff Wyandotte, Mo.	1192
8.	S. C. White Leghorns, Cal.	1185
23.	Silver Wyandotte, Ill.	1182
59.	Black Minorcas, Mo.	1177
9.	S. C. Brown Leghorn, Mo.	1180

A thing which is worthy of our consideration is the fact that pen No. 11, Black Minorcas, from Iowa, is a pen which was entered in the last year's contest and made a very poor record. The owner was not discouraged and entered the same hens again this year. More than half of them are two year old hens and they were among the leading pens last month, and tied a pen of Anconas from Missouri for the silver cup for June, each pen laying 212 eggs. A pen af White Leghorns from California also went into the ranks of the first twelve pens, and others moved up the list as will be seen by comparing last month's report and this. The hens and pens which continue to lay a reasonable number of eggs during the hot weather are going to be the hens and pens which win.

The highest twelve pen records for June are as follows:

Pen No.		Eggs.
1.	Anconas, Mo.	212
11.	Black Minorcas, Ia.	212
10.	R. C. White Leghorns, Mo.	210
17.	Black Minorcas, N. Y.	199
18.	S. C. Buff Leghorns, Mo.	194
8.	S. C. White Leghorns, Cal.	186
2.	S. C. White Leghorns, Eng.	191
26.	Buff Wyandottes, Mo.	184
5.	Black Minorcas, Mo.	181
20.	White Wyandottes, Ark.	178
7.	Anconas, Ore.	178
14.	S. C. White Leghorns, Pa.	176

The highest twelve individual records made thus far are as follows:

Hen No.		Eggs.
860.	Buff Wyandotte, Vt.	190
66.	S. C. White Leghorn, Eng.	187
100.	Buff Wyandotte, Mo.	184
62.	S. C. White Leghorn, Eng.	179
61.	S. C. White Leghorn, Eng.	178
65.	S. C. White Leghorn, Eng.	175
735.	Black Langshan, Mo.	171
67.	S. C. White Leghorn, Eng.	167
516.	Buff Wyandotte, Mo.	165
55.	R. C. White Leghorn, Mo.	165
77.	Ancona, Mo.	164
72.	Ancona, Mo.	162

TO RENT FOX RANCHES IN ALASKA.

Announcement has been made by the Secretary of Commerce of his intention to lease twelve islands on the coast of Alaska to persons who wish to engage in the business of rearing foxes. The islands will be leased for a period of five years to the highest responsible bidders.

Recently the rearing of foxes for their furs has attracted a great deal of attention. Public interest has been aroused by the remarkable results achieved in this industry in the eastern part of Canada. The prices reported to have been paid for silver foxes, black foxes, and other valuable varieties are almost fabulous. The demand for foxes by breeders has been so greatly in excess of the supply that live foxes of the desired varieties bring many times the amount which could be secured for their pelts.

While the breeding of foxes in Alaska has attracted but little public attention, the business has been going on for a number of years, and the requests made to the Department of Commerce for permits to take wild stock for the purposes of domestication have been steadily increasing. On the Pribilof islands the practice of taking the Arctic blue fox has been pursued for many years. In 1912 the sale in London of the 391 blue and white fox skins taken on those islands during the winter of 1910-11 netted the United States government $15,096.58. The London sale in 1913 of the 413 skins taken in the winter of 1911-12 netted the government $20,505.17. At this sale one lot of 28 skins was sold for $3,675, or more than $131 per skin. It is thus seen that the blue foxes in the government herds on the Pribilof islands produce exceptionally fine pelts and are, therefore, very desirable breeding stock. The secretary of commerce will undertake to furnish, under competitive bids, live blue foxes from the Pribilof islands to those who desire choice breeding stock.

There is little doubt that the various species and varieties of foxes can be improved by the application of methods of animal breeding used by up-to-date breeders of live stock.

Texas Fever Quarantine Line

To the American Breeder:—Through what part of Oklahoma and Arkansas does the quarantine line extend?—Wm. H. Young, Sedgwick County, Kansas.

This inquiry, we presume, refers to the quarantine line for Texas or splenetic fever. This line was fixed by the Bureau of Animal Industry Order No. 194, effective March 1, 1913, as follows:

For Oklahoma.

The entire State of Oklahoma is quarantined except the counties of Cimarron, Texas, Beaver, Harper, Woods, Alfalfa, Grant, Woodward, Major, Ellis, Garfield, Dewey, Blaine, Kingfisher, Logan, Roger Mills, Custer, Beckham, Washita, Greer, Caddo, Jackson, Kiowa, Comanche, Oklahoma, Harmon, Canadian, Kay, Noble, Pawnee, Payne, Lincoln, and Cleveland; that part of Tillman County north of the "base" line; that part of Grady County north and west of a line beginning at the eastern line of said county at its intersection with the township line between townships 7 and 8 north, thence west on said township line to the range line between ranges 5 and 6 west, Indian meridian, thence south on said range line to the southeast corner of section 13, township 7 north, range 6 west, Indian meridian, thence west along the section line through the middle of township 7 north, range 6 west, and township 7 north, range 7 west, to its intersection with the St. Louis & San Francisco Railroad; thence southwesterly following said railroad to its intersection with the Chicago, Rock Island & Pacific Railway, thence southerly following said railway to the Stephens County line; that part of McClain County north of the township line between townships 8 and 9 north; that part of Pottawatomie County north of a line beginning at the west line of said county at the southwest corner of section 19, township 7 north, range 2 east, Indian meridian, thence east on the section line between sections 19 and 30 to the southeast corner of section 22, township 7 north, range 3 east, thence south on the section line to the township line between townships 6 and 7 north, thence east on said township line to the Seminole County line; that part of Osage County west of the range line between ranges 7 and 8 east, Indian meridian; that part of Craig County north and east of a line beginning at the southeast corner of township 26 north, range 21 east, Indian meridian, thence west along the line between townships 25 and 26 north to the southwest corner of township 26 north, range 20 east, thence north along the line between ranges 19 and 20 east to the northwest corner of township 26 north, range 20 east, thence west along the township line between townships 26 and 27 north to the Nowata County line; and that part of Ottawa County west and north of a line beginning where the Spring River intersects the northern line of said county, thence southerly along the course of said river to its confluence with the Neosho River, thence continuing southerly along the course of the Neosho River to its intersection with the St. Louis & San Francisco Railroad, thence southwesterly along the said railroad to its intersection with the Missouri, Oklahoma & Gulf Railroad, thence southerly along the Missouri, Oklahoma & Gulf Railroad to the Delaware County line, thence west along said county line to the southwest corner of Ottawa County.

From the other counties and parts of counties in the State of Oklahoma cattle shall only be moved or allowed to move interstate to points outside of the quarantined area in accordance with the regulations for immediate slaughter, or for other purposes as provided by the regulations for dipping, inspection, or certification.

In the state of Oklahoma where a line of railroad separates the quarantined from the free area, shipping points are reserved for noninfected cattle, as follows: Rush Springs and Agawan, Grady County.

For Arkansas.

The entire State of Arkansas is quarantined except the counties of Fulton, Randolph, Clay Greene, Lawrence, Craighead, Mississippi, Poinsett, Crittenden, Benton, Washington, Carroll, Madison and Newton, that part of Sharp County north of the Strawberry River; and those parts of Cross, St. Francis, Lee, and Phillips Counties east of the St. Francis River.

From the other counties and parts of counties in the State of Arkansas cattle shall only be moved or allowed to move interstate to points outside of the quarantined area in accordance with the regulations for immediate slaughter, or for other purposes as provided by the regulations for dipping, inspection, or certification.

For Kansas.

The following mentioned area is quarantined: The stockyards of the Atchison, Topeka & Santa Fe Railway at Elgin, Chautauqua County, Kans., and the fenced strip of land extending from said stockyards to the Oklahoma State line.

LIGHT HORSES, ETC.

SPOTTED STALLION AND MARE

with mare colt by side. Stallion four years old; 16½ hands high; has weighed 1400; black and white, equal parts; distributed over body nicely. A sure breeder. Mare six years old; 16½ hands; has weighed 1450; bay and white, equal parts; distributed over entire body. Colt marked right to three months old. Broken to all harness nicely. Accustomed to working together and extremely attractive. Will sell one, two or three. Might trade for one of those big jack colts.

V. C. WRIGHT,
Edgewood, Effingham County, Ill.

FOR SALE—ACCOUNT OF FILLIES.

Curator 4723 (1757); Imported German Coach; black; 8 years old; a sure and good breeder and a prize winner at International.

Also one jack colt 8 months old, sired by Empire Jr. 4315, by Empire by Gov. Woods (half brother to Superior Mammoth; first prize jack at Chicago World's Fair). He has 30-inch ear, a good head with plenty of bone and body. Priced right. **W. F. BURNETT, VERGENNES, ILL.**

TROTTING STALLION--1200 POUNDS

Black; handsome; 16 hands high, four years old. Good disposition in and out of harness. Sire and dam both registered; tracing through several generations of the best trotting blood. A great speed prospect. Quitting the business; will sell cheap.

S. S. ROWE,
Clifton Hill, Randolph County, Mo.

FOR EXCHANGE.

Kyger Jay 51818; handsome, black stallion; 15½ hands; sound. Showed 20 gait in 90 days' work; by Alstrath 2:24¼, by Alcyone. Dam Lena Jay 80646, by Jay Bird; granddam by Hinder Wilkes; third dam by Margin by Almont 33; other dams good. Will trade for extra large jack, two to four years old. Give dimensions, etc., in first letter. Must be large and fine.
C. E. BROWN, Maineville, Ohio.

REGISTERED MORGAN HORSES.

My Morgans ars large; 15 to 16 hands and 1050 to 1300 pounds; have clean, heavy bone and possess all of the style and endurance for which the breed is noted.

For Sale—Weanlings to 3-year-olds, by The Admiral 4871 A. M. R., he by Jubilee De Jarnett. Send for catalog. **Richard Sellman, Rochelle, McCulloch County, Texas.**

EXCELSIOR SHETLAND PONY FARM.

Registered stock a specialty; a limited number for sale. W. H. Fulcomer, Prop., Belleville, Republic Co., Kas.

WHO CAN HELP IN THIS CASE?

To the American Breeder:—I have a stallion I want registered. He is a son of Bourbonite Jr. (36041), Rule 1, Volume XVI, A. T. R.; dam, Parker's Regis in Volume XIII, by Church Bros. of Frankfort, Ky. Was shipped to Cambridge, Ind., to John Lackey's horse sale. Was sold to Paul Parnard; he sold her to A. E. Brattam, Alexandria, Ind.; he sold her to G. M. Reed of Oolagah, Okla., and he to me. I want this horse registered and the assoctaiion demanded of me the transfers from Church Bros. on down. I wrote them and their letter was returned. I hear they are deceased. Neither can I find Paul Parnard or A. E. Brattam. What am I to do? Col. Coffeyville is a half-brother, from some mare, and they succeeded in registering him. Will someone tell me how to proceed? This horse is a good one and it would help out in his service.—Robert F. Auten, Lincoln County, Colo.

BREEDING STOCK AT AUCTION

Big Mid-Summer Sale

Evansville, Ill., Wednesday, Aug. 6

As I am going to retire from the farm, I will sell at Public Sale, August 6, 1913, my entire lot of live stock, as follows:

1 Ton Percheron Stallion, 5 years old
3 Percheron Mares, all in foal
1 Percheron Filly
1 Registered Saddle Stallion colt
1 Registered Saddle Filly
Grade Mares, Horses and Mules. Also Cattle and Duroc Jersey Hogs.

For Particulars Address

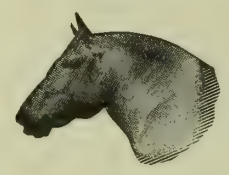
H. P. Wicklein, Route 2, Evansville, Ill.

Geo. W. Souers & Sons

Horse Importers

Huntington :-: :-: :-: Indiana

D. K. ROTH



GIBSON CITY, ILL.

IMPORTER AND BREEDER OF BELGIANS AND PERCHERONS

Not How Many, But How Good.

Square Dealing My Motto. Write Me Your Wants

"AMERICAN BRED PERCHERONS"

Anthon 25137 (45446) by Besique (19602), at head of herd. We have on hand several fillies and stud colts sired by Gouveneur 55323 (70200), for sale. Also a black stallion of fine quality coming three years old in July, for sale. Come and get a colt where you can see the sire and dam. Onarga is eighty-four miles south of Chicago on the I. C. R. R., and about seventy-five miles east of Peoria.

H. KNOCHE & SONS, Onarga, Ill., R.F.D. No. 2

WHITE OAK STOCK FARM

American bred Percheron Stallions and Mares.

The best to be had of the breeder—can show sires and dams of most of them. Always a large number to select from at reasonable prices, considering the kind of stock. Address your wants to D. Augstin, Carlock, Ill. R. F. D. No. 2.

Carlock is on the L. E. & W. Ry., and thirty miles southeast of Peoria, ten miles northwest of Bloomington, Illinois.

"TAUGHT ME MORE THAN ALL PAST EXPERIENCE."

To the American Breeder:—Am having fine results with capsules. Have served 114 mares and will get 30 or 35 more. This to my trotter, Chestnut Bell. Have never made more than two services in any one day. At first I found lots of talk against this system, but I have talked any reasonable man over. The lessons in the American Breeder school enabled me to do this. I will attend the February term of the Graham Scientific Breeding School. The American Breeder school has taught me a great deal more about the breeding business than all past experience. The American Breeder teaches the "why" and "how." Long life and prosperity to the American Breeder school.—C. M. Stamps, Upshur County, Texas.

SACRIFICE

To Quit Business.

Two aged draft stallions at less than market gelding prices; one imported Percheron; weight 2150 pounds; sound. Cash, or would trade for brood mares, jennets or calves.

Address S. J., Care American Breeder.

150 STALLIONS.

Imported and home-bred stallions. I guarantee to sell you stallions for less money than any firm in America. Come to a Live Horse Market and see all draft breeds. Reference, any Bank in Creston. **A. Latimer Wilson, Creston, Iowa.**

$300 BUYS

Jim Erastus, registered Percheron stallion; 13 years old; black; sound; gentle; right every way; weight 2,200 pounds. Good breeder. Sell because of too many fillies. Also two, three year old German Coach horses.

W. H. RHAMEY, Lakeville, Ohio.

PERCHERONS

Thirteen young registered studs with BIG SIZE, a lot of bone and square built. Sound and in good flesh. Moneymakers for you at my breeder's prices.

FRED CHANDLER,
Route 7, Chariton, Iowa.

PERCHERON STALLION—A BARGAIN

To trade, Sir Glewood 45666 P. S. of A.: nine years old; black; weighs 1800 pounds. A pleasure to handle him. Has never been over-worked as I have used the capsule system in breeding. Last year's work shows 82 per cent of mares in foal. Have had him five years and must dispose of him on account of his fillies. Want to trade for a No. 1 jack to weigh not less than 1000 pounds, and must be a good performer on mares. State what you have. I mean business.

CHRIS. J. WEITERER,
PRAIRIE VIEW, Logan County, ARK.

PERCHERONS, BELGIANS AND GERMAN COACH MARES AND STALLIONS

of all ages for sale. I have recently taken over the entire stock of horses formerly owned by the firm of Ives & Bellman and can furnish patrons with first-class breeding stock of the foregoing breeds. Have a fine lot of last spring's and yearling colts, as well as mature stock to select from. Address, **WILL BELLMAN, R. 1. DELAVAN, WIS.**

PERCHERON MARES TO TRADE FOR GOOD WORK MULES.

I have five registered Percheron mares, all bred to good registered stallion, and I need instead for clearing up a large tract of new land, mules weighing close to 1,200 pounds and preferably 3 years old. Will trade the mares or sell mares and buy mules.

Fred Pollman, LaCygne, Kas.

150 PERCHERON MARES, STALLIONS, JACKS, MULES AND JENNETS.

For a number of years I have been breeding Percheron horses and mules. This season I have decided to quit the business. I offer my mares, mules, jacks and jennets for sale at reasonable prices. This is good stuff. **H. D. Hallock, Englewood, Kas.**

PERCHERONS FOR SALE.

Registered in Percheron Society of America. One 4-year-old black imported Percheron stallion of exceptionally good breeding, size and bone, and a breeder. Colts to show.

Also four mares and two suckling colts. I will price these for quick sale as I wish to quit business. Write for description and number of pedigrees. **E. A. WALLACE, DALLAS CITY, ILL.**

CLYDESDALE HORSES

Stallions and mares of all ages for sale.

Also Shorthorn Cattle.

W. A. DeMerritt

Route 2, Plainfield, Ill.

STALLIONS, JACKS AND BROOD MARES.

For sale; all registered. Other good driving and saddle stock. Thirty first-class Missouri mules, 3 years; most of them broken. Will sell at right prices. For information write **EDWARD ORNE, FAYETTEVILLE, ARK., ROUTE 2.**

IMPORTED AND HOME BRED STALLIONS AND MARES.
PERCHERONS, BELGIANS, SHIRES.

The best importation we ever made is now in our barns ready for inspection. The mares include some of the best fillies that came out of the Perche this year. See what we have before buying elsewhere. **Address Hart Bros., Osceola, Iowa.**

PERCHERONS.

Imported and home bred stallions and mares, from $200 to $900 each. **H. Redenius, Rushmore, Nobles County, Minn.**

H. P. Wicklein of Evansville, Ill., is going to sell at public auction on August 6th, his entire lot of live stock. No doubt there will be bargains a plenty at this mid-summer sale, and any one in the market should not fail to read the ad, and if interested, attend the sale.

SCIENTIFIC BREEDING SCHOOL

Soon after the Stallion and Jack News was started, a demand was created for a breeding school. Fred Foote of Oasis, Mo., wrote the editor, asking that he start a school for horse breeders. Other inquiries followed. This demand was continued. There was no rest until the editor announced that this instruction could be had in a practical way. The readers, themselves, demanded this instruction and they wanted personal instruction.

The first class consisted of 23 men. Even though the information available at that time was limited, a majority of these men have done exceptionally well. Several of them are the best breeders in the country today. Since then the school has been improved with each succeeding class. Some of the work has been condensed while other parts of it have been broadened out. It is now far more complete and efficient than at the early terms.

One of the difficulties experienced by some of the scientists who lecture at this school, was in making their lectures and demonstrations plain enough for the readers to thoroughly understand. But gradually all technicalities have been dispensed with—plain language has been substiuted. In fact, it has been made so plain that one student who could neither read nor write, understood, and has been successful. Any ordinary man who will pay particular attention to the lectures and demonstrations cannot fail to be benefited.

Since the beginning of this school the editor of the American Breeder has had the management of it. He has employed for instructors the men best able to impart a practical, working knowledge, and, in his opinion these instructors are now the best posted men on breeding subjects in America. None of these instructors, except the editor, is connected with the American Breeder. They are high priced men of national reputation, but they are deeply interested in this subject, and money consideration alone could not secure their services. These instructors are all busy men. Their services are in demand as investigators and in a professional way. Far from seeking notoriety, they will not permit their names to be advertised. It is a surprise to every class when these men are introduced. These specialists are constantly carrying on scientific experiments and are doing much for the breeders of live stock.

We believe that every breeder should be glad to know that there is an institution where plain horse breeders can spend a week and get the fundamental principles of their business thoroughly established in their minds. All of the time-consuming preparatory work done in other institutions, is dispensed with—the real breeding problems and demonstrations are brought forth.

It is wonderful how much information a breeder can acquire within one week's time at this school. On a few occasions some breeders have been anxious, upon their arrival, to talk about their success, but as the term progressed they became very anxious to listen. This school is not all work, as some recreation is a necessity. The class goes in a body to different entertainments of a moral character. Many interesting things are seen and there is a lot of wholesome fun.

The August term will be the last term until December. There will only be two terms this year. Those who attend the August term will have an opportunity to get some experience this fall and get a lot of their non-producing mares out of the way.

This school guarantees to give entire satisfaction or the tuition fee will be refunded, the student alone to be the judge. At every class, the entire class has had an opportunity to get their tuition fee back for the asking. So far every student has been satisfied. They get so much more than they were expecting that they do not think the tuition fee high enough.

Breeders, in many nearby sections have not estimated the value of this instruction properly or the attendance would have been greater, for men come from as far away as Pennsylvania and California and declare themselves well paid. Lots of breeders expect to attend "some time," but they continue to put it off. There is only one way to attend this school and that is to arrange to be on hand at a particular term. If farmers and breeders wait until everything is done at home before they go anywhere, they will never get started. An industrious man can always find something to do, but by spending a week's time at a term of this school, the average breeder can save a month of time at each breeding season, get a better per cent of foals, and make more money. Every breeder is entitled to at least one week in the year as a vacation. That week could not be spent to a better advantage than by attending this school.

The tuition fee is $25 for a life membership. Don't forget dates for the next term, August 11 to 16.—Adv.

TWIN MULES VIA EXTRACTOR ROUTE.

To the American Breeder:—I thought I would write you a few lines as I am a reader of your valuable paper. I think it is the greatest paper that a man can get for the breeder. I am doing a very good business and getting good results. I am using a Carlson extractor with good results. Enclosed find picture of my old mare which I bred July 9, 1912. Extracted the semen used on this mare and the result is twin mules. These mules were foaled June 14, 1913. This photograph was taken when they were three days old. These belong to J. B. Berks, Elgin, Neb. They are a lively set of twins.—C. J. Green, Antelope County, Neb.

TWIN CAPSULE MULE COLTS AT THREE DAYS.

LENGTH OF PREGNANCY.

To the American Breeder:—When a mare is bred to a Standard bred stallion and party afterwards claims he bred same mare to a draft horse, and mare foals in 12 months and two or three weeks from first service, and the colt has all the appearance of a Thoroughbred, how long have aged mares carried their foals? What would you make out of this? I have known five year old mare to go 12 months and one day, but like to have the opinion of the best and oldest breeders that are reached by this journal.—Colorado Subscriber.

HOW DID THIS HAPPEN?

To the American Breeder:—I have a patron that is a good, straight citizen, that bred a mare here last spring, first to my horse. Later she was rebred, and he said she was bred to the horse, and she has a mule colt. Now, I want to know if it is possible, that if I had double covered a mare before this one, with the horse and jack both, could the horse have got this mule colt? I would like to hear from a number of stock men through the American Breeder, if possible, how it was.—W. P. Dickson, Craighead County, Ark.

MARE WITH THREE TEATS.

To the American Breeder:—I have been handling stallions for 30 years. I have received a great amount of information from your paper, especially your lessons that you are publishing. I have often thought we ought to get more colts than we do. I have a Belgian that weighs 2300 pounds and a German Coach horse. I have learned some things in 30 years yet sometimes I think I don't know anything about it. There was a four-year-old mare that had three well developed teats. I want to know if any one ever heard of a case like this?—John E. Billingsly, Miami County, Ohio.

MULE WEIGHED 860 AT 53 WEEKS.

To the American Breeder: My black jack (weight 900 in breeding condition, 1,000 when fat) sired a mule colt that weighed 860 pounds at 53 weeks old, and measured 63½ inches in girth and 61 inches tall. How does this compare with the average of several thousand mules at that age? It must be quite a bit above the average, I think. Several men who claim to have seen many mules of that age, claim that this is the best one they ever saw. But no doubt there are some that are larger. Its dam is a Belgian grade mare weighing 1400 to 1500 pounds. Let us hear from others.—W. W. Strock, Ashtabula County, Ohio.

ANOTHER GREAT MULE TEAM.

To the American Breeder:—Seeing the cut and description of those Republic county mules in the last American Breeder, interests me to the extent of writing you about my mules, which are the same age. Last March before they were three years old, they beat these mules 165 pounds, weighing 2,865 pounds. My mules got first in harness at the Topeka state fair last fall. I expect to show them this fall weighing 3,000 pounds.—Adam Becker, Jefferson County, Kas.

Glanders And Its Prevention

Horse Disease Known Before the Christian Era That Lately Has Been Reduced to Minimum by Common Sense Precautions.

Glanders is a transmissible disease peculiar to horses and mules, but may also affect some other animals, including man. It is caused by a germ, which has a tendency to destroy the tissue, particularly skin and mucuous membranes and form ulcers.

Glanders is one of the oldest known diseases. It was described with considerable accuracy even before the Christian era. It was found to be transmissible to man about 1837. The germ causing it was identified in 1882, since which date the development of the knowledge concerning glanders particularly in relation to its transmission from horse to horse and from horse to man, has been rapid and accurate and today there are practically none who do not accept the theory of the infectiousness of glanders. There are still a few who maintain that an ulcerated condition of chronic catarrh may terminate in glanders. This idea is rapidly disappearing because of the fact that the various live stock journals have been continually describing this disease and indicating the ease with which it is transmissible from animal to animal and from man to man.

Glanders is found in practically every country with the possible exception of Iceland, Australia and some islands. The disease is found in practically every part of the United States and here, as in other countries, there are also more cases in the sections of the country in which there is extensive horse traffic, such as the large horse markets of Kansas City and St. Louis. In the state of Missouri from 1896 to 1912, there were 1,619 horses officially destroyed for glanders. It is possible that one-fourth of this number was destroyed in the same length of time without official condemnation, making a total loss in this state of 2,000 animals in sixteen years. However, from 1901 to 1912, 1,401 cases of glanders was destroyed in the state of Missouri, which indicates that the disease was more prevalent in the latter ten years than it was in the previous six years. Some reasons will be given later for the extent of this disease from 1901 to 1911. North Dakota reported 268 animals destroyed for glanders in 1903, 308 in 1904, 229 in 1905, 476 in 1906, 931 in 1907, 602 in 1908, indicating that the state of North Dakota has a serious problem to contend with in the disease, glanders. No doubt the explanation of the large number of cases in North Dakota and the apparent increase in the number of these can be explained by the fact that it is a relatively new country and has been settled extensively during the years in which glanders records have been cited.

The glanders germ is like other germs, a little plant. It varies in length, but ordinarily is about one-half of the length of the diameter of a red blood cell. This germ does not form spores and is, therefore, not as difficult to destroy as some other forms of germs, which do form spores. The vitality of the glanders germ necessarily varies according to the conditions to which it is exposed. It is readily destroyed by heat, the death point ranging from 130 to 185 degrees F. It is not destroyed by low temperatures. Drying destroys the germ, though the length of time necessary for destruction depends upon conditions and the time necessary will vary from 20 to 45 days. Direct sunlight destroys the germ in a few minutes when it is not enclosed in discharges or other substances which shelter it from the influences of the light. This germ is easily destroyed by practically any kind of disinfecting solution, providing the disinfecting solution can gain contact with the germ. Whether or not this germ will produce glanders when introduced into the animal body, will depend upon whether or not the animal has sufficient resistance to destroy the invader. It is possible that a large percentage of the horses, particularly in cities, have been affected with the glanders germ, but the horses' systems have been sufficiently resistant to successfully ward off an attack of glanders, though in some instances it is not at all improbable that microbe remains dormant and inactive in the tissue for a considerable length of time and when the animal becomes depressed, the germs begin to grow and multiply and thus produces a fatal attack of glanders.

The germ producing glanders probably most frequently enters the animal body with either food or water, although it is possible for it to be introduced through the respiratory organs or directly into wounds of the skin. The open watering trough is a source of infection and animals affected by drinking water contaminate other animals by discharges of glanders or by contact with animals while drinking. In Minneapolis, Minn., in 1904, 117 horses were destroyed because of glanders, in 1905, 110; in 1906, 117. During the three years mentioned, public drinking fountains were open. Early in 1907 the public watering troughs were closed, teamsters being required to carry buckets to water their teams and the fountains remained closed and the results in the number of cases of glanders is certainly amazing. It is found in 1907 that 48 were found and destroyed, in 1908, 13; in 1909, 5; in 1910, 7, and in 1911, 7. Practically the same records are found and hold in Kansas City and St. Louis and this data should be sufficient to warn the horse men of the general danger of the public drinking fountains for horses.

Glanders usually evidences itself in a horse, first, by a general systematic disturbance, which results in weakness; the animals tire easily, there may be a slight discharge from the nose. A little later the animal becomes thin and poor, has a rough coat, they are of little service because of the fact that they cannot withstand labor. As the disease progresses there may be evidenced in the nose distinctly outlined rough surfaces, that usually terminate in glanderous ulcers. These ulcers may be low down so that one can readily detect them, or they may be so far back in the nostrils that it is necessary to use special instruments in the identification of the lesions. The disease is also evidenced by little nodules appearing on the inner side of the hind legs, also of the fore legs. These nodules gradually enlarge, finally the skin breaks and pus is discharged from them. This usually results in the formation of an ulcer and if it heals at all, does so slowly and with the formation of a distinct scar. Should any breeder have an animal that is at all suspicious, the animal should at once be isolated, kept from all other horses and mules and every precaution should be used to keep the discharges from the animal's nose or skin lesions from contaminating food stuff, troughs, mangers, that will be likely to be a source of infection for other animals. Then a competent veterinarian should be called in to determine whether or not it is a case of glanders and should it be pronounced a case of glanders, the proper state officials should be notified so that the animal can be properly disposed of and thus prevent further spread of the disease. By care on the part of the stock owner he can frequently prevent extensive loss in his own barns and also prevent the spread of the disease to his neighbor's horses in the immediate community. The United States authorities and practically all the state authorities are using every means to prevent further loss from this disease. It has been found necessary to require a strict surveillance of the transportation of stock from state to state and this is the reason why the Live Stock Sanitary Commissions of the various states have installed a rigid system of inspection of all animals that are being shipped interstate. If all stock breeders will assist the various state officials in identifying suspected glanders, and also in the prevention of the sale of glanderous horses and the shipping of such to the various horse market centers, this disease like some of the other infective diseases, will soon be practically unheard of. It is a disease that shows lack of care on the part of the horse man or it indicates an indifference on the part of those in charge of live stock, to the healthfulness of their animals. Practically any qualified graduate veterinarian has the means at his command to absolutely diagnose this disease, and if the horse men, such as the breeders, horse dealers and teamsters, will combine their efforts, the breeders of horses and those concerned in horse traffic will soon realize the profits from such actions.

BARGAINS! I am cleaning up my stock of Big Jacks and Draft Stallions

And am making the lowest prices you ever heard of for stock as good.
Just come here, pick out what you want and if you don't buy it won't be the fault of the price.
I don't believe in having any good, serviceable stock left when the season ends, and this is the way I keep from it. Come and see.

W. J. Finley, Higginsville, Mo.

QUESTIONS AND ANSWERS

(Continued from page 5).

in this work to do a vast amount of mischief. You should employ men who make these difficult tasks their special work.

ANOTHER SPOILED JACK—I have a young jack that has served jennets. How can I break him to serve mares? I have a jennet I could use if necessary. I haven't tried him much to mares but understand it is difficult to get them to serve mares after serving jennets. Is that true?—Ohio Subscriber.

REPLY—It is very true that young jacks much prefer jennets to mares, after making a service on a jennet. You will have plenty of difficulty with this animal. Since the season is practically over we should advise in this case to get a small, gentle mare that is in heat most of the time. You can easily find one of these mares and the owner will be glad to let you have her if you will breed her for nothing. Make a practice of trying the jack every two or three days on this mare. It might be well to have her tied in the stall next to the jack so that he would get thoroughly acquainted with her. When you are ready to make the service get a little urine from a jennet that is in heat and put it on the mare's tail, and let him smell it. Have lots of patience and figure on spending lots of time. Be very gentle with him, but after you make the first service continue to make a service every day or two for several weeks so that he will be well broken before he forgets this desire.

DILATED OS—One of my customers has a three-year-old filly that we are not able to get in foal. Upon examination I find the mouth of womb is about three inches in diameter. Can there be anything done for such a womb? I have had 18 years' experience and never found anything like this before. Can there be anything done to get her in foal?—Missouri Subscriber.

REPLY—Breed this filly about two days after she goes out of heat, with a capsule, and if you do not get results send her to a veterinarian for treatment.

A BREEDING PROBLEM—How long does the egg that is discharged from the ovary stay in the womb in the mare after it is discharged in the womb?—Ohio Subscriber.

REPLY—We do not know how long the ovum stays in the uterus after it is discharged. The egg is not liberated from the ovary until the heat period is closed. It probably spends

$650 BUYS
the famous herd and mule jack of Kentucky and Kansas, known as Dr. Hartman, but registered as Mike. Sound and hearty; good per cent of foals. Is a jennet jack, but has always worked that way. Three good registered jennets, heavy in foal to above jack. All for $650 if sold at once. Other business cause of sale.
SONGER BROS., Lincoln, Kas.

KENTUCKY JACK FARM
Established in 1884.
A fine lot of black Mammoth Kentucky jacks. Big bone and plenty of weight. Will sell at special prices in order to make room for young stock. We sell more jacks to the Western trade than any breeder in Kentucky. Write for prices or come and see me. Guarantee to please our customers.
Joe E. Wright, Junction City, Ky.

FAIRVIEW JACK AND JENNET FARM

32 Jacks and 35 Jennets, the best that grow, 14½ to 16½ hands high—jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address
J. C. HUCKSTEP, Eolia, Pike County, Mo.

TWO BLACK JACKS
for sale. Six and eight years old; good breeders. One 64 inches high; 70 inches heart girth; 9½ inch shin. Price $600. The other 61 inches high; 64 inch girth; 7¼ inch shin; blocky built. Price $400. Either one of these jacks will pay for themselves in a single season if rightly handled. Good terms to good parties. No trades. **G. T. Poage, Garrison, Mo.**

JACKS.

20 good black jacks and some good jennets; coming 3 to coming 8 years old. Large, heavy boned, broken to mares and prompt servers. Prices reasonable. Come and see me. Barns 2 miles from town.
Phil Walker, Moline, Elk County, Kas.

PAGE AVENUE JACK AND JENNET FARM.
Fine jacks, from yearlings up, for sale. As good a bunch as anybody has got. Aged jacks fit for herd headers—two of them as good as grow. Visit our barns and see for yourself, and buy the best in the land.
J. R. REYNOLDS & SON, GUTHRIE, MO.

To Exchange
Fine, large, young, black jennets, bred early to our Tennessee jack, to exchange for a jack not less than 15 hands Standard. Am quitting the jennet business.
L. D. NORRIS, REDDING, - - IOWA.

from two to five days in the uterine duct.

NAVEL ILL—I have a colt six weeks old that has a lump in front and slightly below the stifle joint. This lump is four inches in circumference and seven inches long and can be moved about three or four inches either way from where it naturally rests. I used an antiseptic prepared by veterinarian for prevention of navel ill. This dope was used in the morning as soon as we found the colt, but when colt was about nine days old we noticed that the navel was swollen. Called different veterinarian who made small incision on each side of navel. Next day noticed urine dribbling from navel. Veterinarian tied navel to prevent leaking and left sort of white looking liquid to be used on navel. Same day navel was tied we noticed swelling on stifle. Veterinarian said this would get all right when his medicine (which he administered hypodermically) had a chance to work. The lump kept getting larger and colt got lame. When lump got about as large as a man's two fists we decided to lance same, which we did, making a small incision about an inch long and just through the skin in front of the stifle. Pus squirted about ten feet from this incision. We squeezed all the pus out that we could and blistered the lump with caustic balsam. Colt is doing well and seems to feel all right, but walks with slight hitch in his step with the affected leg. Can hear a snapping sound when he walks. The lump is still about three or four inches in circumference and seven inches long, and movable. This is a very nice colt and we are tempted to tie him up and cut out the lump. What shall we do?—Ohio Subscriber.

REPLY—Your complaint sounds very much like infection through the navel. The mischief has been done and about all that can be done now is to apply something to the affected parts. Use tincture of iodine on the stifle once a day until the skin becomes sore, then discontinue for a while.

FEEDING A BELGIAN COLT—I bought a Belgian stud colt 13 months old, weighing about 1100 pounds. I wish to give this colt all the size I can and yet not overfeed him. Am feeding him green alfalfa and ground oats. How many pounds of ground oats per day can I feed him without overfeeding him? He is a very greedy eater.—Montana Subscriber.

REPLY—Gradually increase the oats until he is on full feed. This increase should be very gradual, in fact it might be better to give him just what he will clean up from one meal to the next. Dimish the alfalfa to about one-half of the roughness; substitute prairie hay as the balance of the hay ration. It might be well to build a self feeder for this colt so that he could not eat too rapidly. In fact, all horses should be fed with a self feeder; there would be less sick horses and more benefit derived from the grain ration. Horse feeding should not be governed by the number of pounds. Each individual animal requires special attention as to the amount given. Watch the bowels; if they should smell badly, diminish the grain slightly. This colt should have at least one acre in which to exercise, and plenty of good water.

OFFENSIVE DISCHARGE—I have a valuable stallion with an offensive discharge of one nostril. He took distemper about a year ago. We used Spohn's Distemper Cure and it seemed to cure him up all right, but two months later it began to run again. Then I called in a graduate veterinarian. He treated him for nasal discharge with water and a little carbolic acid in it, with a fountain syringe. But it does not seem to help. He examined teeth and head for decaying bone (as it smells like that) but could not locate it. If you can give us any pointers we would appreciate it very much. This horse is a Percheron.—Missouri Subscriber.

REPLY—The source of a discharge from the nostril is not always easy to locate. As a rule, one depends largely on the odor in determining this. There may be a diseased tooth fang and yet the teeth may appear perfectly sound so far as appearances are concerned on inspection through the mouth. It may be necessary to trephine the bones of the skull in order to locate the trouble. This can be done by a competent man without any injury to your animal.

MARE FAILS TO PRODUCE—I have a Percheron mare that for the past three years has brought no colts. She wants the horse about every eighteen days. She is in good condition; does some slow work. Our stallion is four years old; I work him at slow work. He seems to be very sure breeder with my other mares. We have no competent veterinarian to make an examination, but, as best I could, I have examined her and could find nothing that I thought ought to stop her from breeding. Would capsule breeding be good to try?—Wyoming Subscriber.

REPLY—This mare should be examined to see whether she is a producer or not. If there is any abnormal condition present that could not be overcome, she might be sold to a good advantage and replaced with a producer, with profit. Try breeding this mare about two days after she goes out of heat, using a capsule.

UNTHRIFTY COW—I have a cow that since about the middle of last winter has lumps on her cheeks at the roots of her upper teeth. They come and go and generally are gone in the morning and come again during the day. Sometimes they will be on one and not the other. About two weeks ago there came a lump under her ear and it came to a head and I lanced it and it run some whitish matter, and is almost healed up now. It seems to be her nature to be thin in flesh. Would like to know what is the matter and if the milk is good, and what to do.—Pennsylvania Subscriber.

REPLY—You should have your cow's teeth examined by a competent veterinary dentist, for it is very likely that she has defective teeth and the lumps complained of are accummulations of food.

A RANK STALLION—My 11-year-old Percheron stallion that has been a company horse in the past, has been abused by over breeding and roading and fails at times to discharge. His next to last service he discharged but last time he served one mare six times and failed each time. He is very keen and is always ready. He is not a good work horse. His feed is now alfalfa hay with a little timothy and green grass. He does not have much exercise. Can give him a corral soon. He bites badly at time of service. Most all of my mares are settled for this year.—Montana Subscriber.

REPLY—Let the stallion mount and if the mare is large enough to carry the horse, let her take a step or two. If he does not succeed put him in the barn and take the bridle off and close the door. Sprinkle some hay under him so that he may urinate. At the next service have the mare all ready so that he can be bridled and gotten in a position to mount before the erection gets too severe. Your stallion should have a good, big corral to exercise in. Do not use him as a teaser if you can help it.

STIFF FILLY—I have a two-year-old filly that is stiff and sore in the coupling or across the loins; has been this way for about two weeks. She has been running in pasture and was in fairly good flesh when we first noticed her. Thought it was just some slight ailment at first, but as she has not improved, and is falling off in flesh, think something should be done for her. She does not try to walk fast or trot, but handles her hind legs very stiffly. She seems to have a good appetite and her passage of both water and dung seem normal. This mare has been bred and has met with no accident in any way that I know of. I had a mare that was similarly affected a few years ago and she died. Please tell me what to do for this mare.—Washington Subscriber.

REPLY—It is quite likely your filly has been injured in some manner and you may apply the following over the loin once a day: Alcohol ten ounces, aqua ammonia two ounces, witch hazel four ounces. Rub in well covering a space eight inches in diameter.

STIFF NECK—I have a mare seven years old that gets spells that she can't move her head to the right side. It seems as though the cords are paralyzed. She stands and holds her head at the same place straight with her body. She can move up or down but not to the right side. She will stand in that position from two hours to a day, or longer. She eats at all times if we put the feed where she can get it. Her weight is 1050 pounds and she is a free driver. She had the same trouble last summer until cool weather came in the fall, when it left her and she was all right through the winter. Yesterday she had the same spell again. She is fed on upland hay and corn now; last year she was fed on oats instead of corn. Please give your advice.—Minnesota Subscriber.

REPLY—If possible have some good veterinarian examine this mare. It may be she has some form of rheumatism or neuritis, and to locate the particular parts affected would be in order before prescribing treatment.

LACERATED PERINEUM—I have a fine four-year-old mare that foaled her first colt this spring. In foaling she tore her rectum and vagina, so there is the one opening for about four inches between, which leaves her what I have heard termed "gill flirted." This seems to be mostly on the right side. This happened about a month and a half ago. She was in moderate flesh at the time of foaling, and is yet, but since foaling her right hip has perished back of the hips, which leaves her slightly lame, but you would scarcely notice it, and I have for a few days been doing some light work with her, which doesn't seem to hurt her. She seems to be in good health. I have examined her vagina and uterus and I find nothing wrong after passing in about four inches, except that in putting my front finger in cervix I find that the opening in cervix slants downward more than most of mares I have examined, as most of them slant into uterus on about a 30 degrees angle. Excepting this I find nothing about the uterus but what is perfectly natural. Would it be safe to breed her this season with a capsule, or would you advise breeding her at all? She is a fine mare and would like to realize some profit from her.—Tennessee Subscriber.

REPLY—This mare may be safely bred with capsule so far as the laceration is concerned, but we would be influenced by how much the lameness persists. She no doubt suffered some internal injury at the time of foaling which has caused the atrophy of the hip. It is quite likely this mare could be bred without danger as the injured part would very likely recover before foaling time.

BOOK WANTED—Please let me know through your paper where I can get the book or pamphlet that shows or tells horses' ages. I have started in the stock business.—Texas Subscriber.

REPLY—Write to Dr. S. Stewart, Dean of Kansas City Veterinary College, 1336 East 15th street, Kansas City, Mo.

CROOKED COLT—One of my patrons has a three-quarter Percheron colt six or eight weeks old, that is pretty much buck kneed and also breaks down entirely too much in the pastern joints, both before and behind. What is the best treatment for both mother and colt to bring it around all right? The mother and colt are in good thriving condition. This man's brother thinks the colt too fat and advises him to work the mare more and feed less, as he thinks the colt too fat to straighten up. I told him I thought not as it will require a good thriving condition to assist nature. Who is right?—Illinois Subscriber.

REPLY—An occasional rubbing of the parts with alcohol is about all that is needed, but at the same time give the colt and mare an opportunity to exercise in the pasture. It takes a little time for these crooked fellows to straighten out, but ordinarily they come all right in due time.

ECZEMA—I have a seven-year-old mare whose hair keeps coming off; started last November and since then has come off about four times. The skin is covered with small pimples, and seems to itch. She has not been worked since last September and before that had been in perfect condition. At first she seems to look as if she had been over heated, but that could not be possible, as I had been very careful because she was with foal. What can I do with her? Do you think her colt will be affected?—Wyoming Subscriber.

REPLY—It is quite likely your mare is affected with eczema and she will need both internal and external treatment. Internally give her one-half ounce of Fowler's solution in the feed three times a day. Externally the affected parts should be bathed once a day with a 3 per cent creolin solution to which one-fourth part of alcohol has been added. Give the mare access to good grass and feed little grain.

ATROPHY—I have a five-year-old horse whose hip has shrunk away. It looks like a sweeney. When I first noticed it he had a slight stretch below the hip bone. He seemed to get all right and then got worse and now drags his legs. He is a saddle animal. There have been several around here similarly affected. Is there any cure for this?—Wyoming Subscriber.

REPLY—It will be necessary to have a qualified veterinarian make a careful examination of this animal in order to properly locate the difficulty before prescribing treatment.

INJURED JACK—I think my jack got kicked, but there is no soreness that I can see. He is in fine shape and very keen, but when he goes to cover he starts to bleed and does so very freely. Was hurt the 11th of May. Have tried him only twice but when he mounts he starts to bleed. Sometimes he does not show it for several days, but then he starts again.—Texas Subscriber.

REPLY—Discontinue this jack from service for the remainder of the season and make use of an appliance to prevent an erection. If this is not

PARTNER WANTED IN HORSE FEEDING BUSINESS.
I would like to get in communication with a horseman, preferably in one of the following states: Virginia, West Virginia, Pennsylvania, Ohio, Kentucky or Maryland, on a horse feeding proposition. I have a good farm of 200 acres; two good size horse barns and plenty of feed. I would like for some horseman to put up the money and buy about eight head of three or four year old horses or mules in November, and let me fit them for market by March.
REMBRANDT MORGAN,
Winfield, West Virginia.

MY BREEDING PLANT
For sale, located in Northwestern Ohio, in good moral town. Good house; two lots; fine fruit; big barn and an established business, including Percheron stallion, weight over a ton and a Clydesdale that can be made to weigh a ton; a grand son of Baron's Pride. They are extra good individuals; both sure and great breeders. Going to move away and must sell by September 1st.
J. W. STIFFEL, **Edgerton, Ohio.**

R. L. HARRIMAN, Bunceton, Mo.
The Fine Horse and Jack Auctioneer of the West
I sell more horses and jacks than all others. Terms always right: work always up to the highest standard.

Hotel Convention 12th and Broadway, Kansas City Mo. Large, airy rooms, good beds. Special rates to students of the Graham Scientific Breeding School. Two persons in one full bed, 35c per day each. One person in a full bed, 60c per day. Good restaurants in connection and nearby. Take Observation Park street car from in front of Union Depot direct to our corner. Only a few minutes' walk to the school building.

done this animal is quite apt to give you trouble another year.

LAME MARE—I have a registered Percheron mare (a fine brood mare) eight years old. At times she is lame; puts out her right foot without lifting it naturally, but shoves the foot along the ground without bending the knee much. This mare was worked last year with an ill fitting collar. Could this be the cause? What can I do for her?—Michigan Subscriber.

REPLY—The location of the seat of lameness is often very difficult from a meager description, and to prescribe without a certain knowledge of the seat of trouble, would only lead to disappointment in the way of results. Secure the services of a competent veterinarian and have him make a careful personal examination.

OVERHEATED MARE — What is good for a young mare that pants? She is suckling a colt and I think she is in foal again. Would salt peter and asafetida, half teaspoonful of each to a dose, hurt the breeding of a mare, in feeding it several weeks, one dose each morning? Some say it will. I would like to know.—Indiana Subscriber.

REPLY—Read our article in another column on this subject. The agents you mention would be of no value for the purpose intended.

QUESTION RELATING TO ESTRUM—Kindly inform me how often a sow comes in heat and how long she stays in heat. Also kindly inform me how often a cow comes in heat and how long she stays in?—Idaho Subscriber.

REPLY—Every 18 to 21 days for the sow. From two to three days. About every three weeks for the cow. About twenty-four hours.

ABORTION—Please send me advice and remedy to prevent mare from trying to foal in about four months from date of service. She will be sick about two days and will have colt taken. She is a good mare and would like to find a cure for same.—South Dakota Subscriber.

REPLY—Abortion has been commented on many times through these columns but the frequent inquiries for relief lead us to believe that abortion among mares is very prevalent. Owners of breeding stock (both mare and stallion) must appreciate that the disease is largely one of a contagious nature, being conveyed to a stallion from an affected mare through the act of coition, and the stallion in turn conveying the disease to healthy mares. Where a mare has aborted regularly for several times she should be placed under the care of a competent veterinarian for treatment and should not be bred for a year. During the period of gestation it has been found that the fluid extract of black haw is helpful in preventing premature foaling. This drug may be given in doses ranging from two drams to one ounce a day, depending on the state of the mare and period of gestation.

MARE ABORTS—Why should a mare that has been bred with the horse pass over two consecutive periods and then come in heat the third? The womb or cervix is closed, but over three inches in length six weeks after being bred.—North Dakota Subscriber.

REPLY—Many mares fertilize but slip the embryo at an early date. There may not be much disturbance in the genital tract during early pregnancy, but all abortions should be watched carefully. A mare of this kind will usually do better by being bred several weeks after a performance of this kind. Some of them, however, fertilize at the next heat period after an abortion. The cervix at this period has not shortened much. In fact, the cervix you describe may be slightly abnormal. As pregnancy advances the cervix shortens. A few weeks before delivery the cervix may feel similar to a hulled walnut.

Johnson Automatic Stallion Bridle

(Patent Applied for Nov. 10, 1909.)

Manufactured exclusively by Peter Young, Assumption, Ill.

Controls the most unruly stallion without injury and will not hurt the kindest and most docile horse. Fits the largest draft stallion or the smallest roadster without adjustment. Made of the best leather. Shipment will be made on receipt of order, as I have them in stock at all times.

Order one, and if not satisfactory, return it and your money will be cheerfully refunded. Price $5, with order. Can be sent by mail. Read these testimonials:

"Enclosed you will find check for $5 for which send one of your stallion bridles to Mr. Jacob Haning, Minier, Ill. Please send at once and oblige.

"P. S.—I have been using one of your stallion bridles for some time. Would not do without it, as you soon have perfect control of your stallion in a short time. Please send bridle to Mr. Jacob Haning, Jr., at once. Send by mail. —Val. Thomas, Jr., Hopedale, Ill."

"I have used the bridle but a few days which I recently purchased from you, but must say no horseman can afford to be without it. It will hold any horse. There is no equal to it. I advise every horseman to have one.—E. A. Berlin, Waterloo, Wis."

"Will say the bridle I ordered came all right. The horse that we wanted it for was one that we could not not use with a chain under his jaw. Had to use rein over his neck and hard to hold back at that. The bridle surprised him very much. My son says he can not say too much for it.—De Mott & Son, Scottsbluff, Neb."

BEGINS NEXT WEEK

THE HORSE BREEDING SCHOOL

The Only Term Between Now and December Will Be Held

August 11 to 16

Breeders with money invested in the business cannot spend a week's time and the tuition fee to better advantage than here, and there is no better preparation for the beginner.

It's the greatest opportunity offered anywhere to make yourself an expert breeder, to learn to avoid the points of the breeding business that cause so much loss to stallion and jack owners every season. All of the instruction is practical and everything taught is demonstrated whenever possible. All instructors but two are expert post-graduate veterinarians doing educational work recognized by the United States Government.

SOME OF THE SCHOOL'S WORK, INCLUDING SUBJECTS TAUGHT.

Dissecting Mares, Anatomy of the Male and Femals Organs, Physiology of the Generative Organs, Cells, Infection, Breeding Questions, Breeding Instruments, Foaling, Scientific Mating, Horse Judging, Mule Judging, Barren Mares, Barren Stallions, Abnormal Conditions, Diseases of the Foal and Fetus, Diseases of the Male and Female, Contagious Abortion, Feeding, Testing Breeding Stock, Determining a Mare's Breeding Condition, Buying Breeding Stock, Hereditary Defects, Horse Breeding, Rectal Examinations for Abnormal or Diseased Conditions; also tell whether a mare is in foal or not. Getting the Semen, Inserting Capsules, etc.

EQUIPMENT AND EXPENSES.

The school has its regularly equipped building, which is just north of Convention Hall, Kansas City, Mo. In the lecture room of this building are numerous charts, stereopticon apparatus for showing pictures and illustrations during the lectures, all kinds of breeding appliances and other equipment necessary for instruction in all the latest methods in horse breeding. A veterinary hospital is utilized in the dissecting work and the barns of dealers in mules and horses in the lectures on types, judging, etc.

Accommodations for all students will be arranged for by the school authorities without charge. They have reserved rooms and board at moderate rates—from $1.00 to $1.25 per day—sufficient to provide quarters for all who come.

Remember the date and prepare to be here next term. When you get here take Observation Park street car at Union Depot; get off at 12th street and walk one block east. **Tuition is $25, which entitles all students to a free return privilege for life.** For other information address

The GRAHAM SCIENTIFIC BREEDING SCHOOL

225 West 12th St., Kansas City, Mo.

REARING ORPHANS

One of my amusements has been the rearing of orphans. Every country "vet." in practice has opportunities for this kind of thing, but he must really love the work, and look to success as his reward rather than a cash balance, although this is by no means out of the question. To bring home a pig in his pocket, riding across a moor or forest, and rear it, brings some of the attachment of the bagman for his dog ("for the bagman resolved on bringing him up to eat of his bread and to drink of his cup; he was such a dear little cocktailed pup"), and, like the bagman also, he has later to part with his pet under circumstances too strong to be resisted. One such, whose mother died farrowing, and, as a matter of fact, was taken by Caesarian section from her ("he was from his mother's womb untimely ript"), fast outgrew a thrush's cage in which he throve from the first, and finally became so persistent a friend that he would suffer no restraint, insisting on sitting beside me and diving into my pockets, whether fresh from a mud bath or not. Mice and squirrels, pigs, puppies, lambs, calves, and foals—upwards in this way the boy's liking for rearing animals ascends, and though other pleasures may pall on the greybeard, the graceful kitten and the clumsy foal never lose their attraction any more than the new leaf in succeeding springs.

But it was not to let myself go as a lover of animals that I began this article, but to point to a few little matters by which success may be expected in the majority of cases; which throws me again off the track to say that my own opportunities of foal-rearing have been curtailed by bringing breeders together in my district to arrange with each other beforehand that, in the event of losing a mare, or having a mare full of milk without a live foal, the breeders should severally inform one another. I have known men on adjoining farms with an orphan foal and a mare wanting drying off "drinks," neither of whom knew each other's circumstances, or thought of the easy accommodation which might result in benefit to both. It is an agreeable office then to act as a go-between; but the transaction finds no place in the ledger. Most folks think there is no such difficulty with calves, and that any stale milker will do to rear newborn calves. They generally buy their knowledge—or, at least, pay a lot to learn—if they never realize that scour is the result of such unsuitable provision.

Having reared every sort of animal, a foster-father's pride will perhaps be excused if anything practical can be said for the guidance of others. Foals are of most concern, because most valuable. When they are orphaned at birth, or from serious illness of the dam which ends fatally, they have not had the advantage of the first milk with its laxative colostrum, or natural aperient. Or it may be that they have drawn what sickly stuff there was in the mare's udder, and it has only upset them. In almost every case, save where the dam is killed by accident a few days after foaling, the youngster will be the better for an aperient by way of a start. Castor oil is usually given. Alone it may pinch the foal, if given in sufficient quantity. If mixed with equal parts of linseed oil and twenty drops of essence of peppermint, or a drachm of tincture of ginger, it is not likely to gripe. Then the alimentary canal is prepared for digestion, and if a perfect substitute for a mare's milk is not provided it will do its best to absorb what is good and reject what is not.

The golden rule of feeding sucklers with nothing to suck is "little and often." Watch the mare and foal in a paddock. First a suck, then a game, then a little nap, and the programme is gone over again and again. What a number of times in the twenty-four hours a foal will take a little nourishment, and is it to be supposed that he takes half a pailful at a time? No, a pint is more like his measure, and this is the quantity that has succeeded best with me. Some folks will take the trouble to give four or five meals a day, but make no provision for the night, and it is here that they break down. In the short nights, when there is so little darkness, an interval of four hours is the longest that should be allowed. If the foal gets too hungry, and is offered more than enough he will take it, and then fail to digest. Scouring follows. It is not cordials and astringents, and chalk and opium mixtures that he then needs, but our oil mixture to clear the canal again, and make a fresh start. Nature is trying to expel soured stuff that is irritating.
well to assist with gentle means.

Of what shall the nourishment consist? Mare's milk is rich in sugar and poor in fat. Cow's milk—especially the butter breeds—is rich in fat and somewhat poorer in sugar. To balance them we must dilute the cow's milk with about 25 per cent of hot water (keeping the temperature a little over that of the body). We thus reduce the proportion of fat to something approximately that of the mare's milk and we add sugar of milk. The latter is now to be had in bulk at reasonable prices, and, in my experience, agrees better with foals than cane sugar, although I have successfully reared on it. There is a little disposition to acidity of the stomach which may be avoided by using the sugar of milk, and, further, this should be guarded againts by the addition of lime water, in very small proportion only, but regularly given as a bone-builder, as well as antiacid. For the first month, say, 75 per cent milk from a recently-calved heifer of the Shorthorn or crossbred (not Channel Island), 25 per cent hot water, 2 per cent sugar, and 1 per cent lime water.

If the foal doesn't get humpy and pen-feathered or hidebound during the first few weeks, he will be fairly safe to live, and from that time forward one may give a little linseed tea, and cake dust, and fine oatmeal, and gradually strengthen the ration —very gradually—and on the slightest sign of scour be sure that the food is not agreeing, and must be lowered. More sugar can generally be borne, but we must not be anxious to push the orphan along too fast; our task is to keep him going until he can eat grass and sustain himself as a weanyer. Seldom, indeed, does a hand-reared foal become fit for competition in October, but by the following midsummer he may take his place with the best. One word of warning to the successful foster-parent may be said in conclusion, and that is, don't fondle foals too much after they have once overcome their natural fears, otherwise they prove difficult to break when the time comes.—Live Stock Journal, England.

Fattening Horses and Mules

A Highly Profitable Industry Which Breeders Can Encourage and Which Helps to Keep Money at Home and Maintains Soil Fertility. Pointers for the Beginner.

The average breeder and farmer might well afford to study the problem of feeding equines for the market. While there are many professionals there are not enough small feeders. Most successful feeders have developed their business from a very small beginning. Each market class should be so prepared as to be in prime condition for its particular market. Large feeders and dealers send out their buyers at a particular time to select stock to fit a certain market. With a little study beforehand, the average stock man in the country may purchase a few head without much traveling expense. Some may object that they are not financially able to do this. Good young geldings of a marketable type, or mules, are just as good security as any other kind of stock. Banks will finance these feeders.

In addition to the profit realized directly in dollars and cents from such a transaction, the experience affords an education not obtained otherwise. Only a few men are capable of forming a correct opinion as to the outcome of a thin animal. Some horses and mules may be very expensive feeders while others fatten easily. This feeding need not be confined to mature animals. Colts, and especially mules, can profitably be handled. Many breeders, with a little education, might use this as a "side line" with their breeding operations.

There is one particular feature that every reputable breeder should steer clear of, and that is "horse trading." Horse trading is not considered a reputable business, as a rule. It is much better to stay closely to the method of buying and selling for cash or bankable notes. Every breeder must remember that a reputation is at stake in all transactions. This does not apply to breeders alone.

The Classes Having Market Seasons.

There are three classes of horses commonly spoken of in the market as having "seasonable markets," draft horses, chunks and Southerners. Fancy horses should be left for the specialist, who has plenty of money and is not necessarily looking for profit.

Draft horses should be prepared for the spring trade beginning March 1; the length of the feeding time should be from 90 to 120 days, or even longer should the horse be thin at the beginning. Chunks should be ready for delivery a little earlier than draft horses. Southern horses should be ready for selling in December and January. A draft horse should weigh 1,600 pounds or more; a chunk might only weigh 1,100 pounds. A chunk is built along the same lines that a draft horse is, except that it does not have the size. The Southern horse is a light road horse weighing from 850 to 1,100 pounds.

There are different methods of "fleshing" these horses. One Western feeder has found it very profitable to sow fall wheat in the month of July. This affords excellent pasture until the first of January, unless a very heavy snow falls. By this method the expense of keeping the horses until time to full feed them is not very heavy, and they are in an excellent condition, requiring only a short feed for delivery. During this short feed he has a pasture in the timber, with feed bunks, where the horses have plenty of room for exercise and they are never stabled. By this method he does not have any "barn fever" and his horses are in excellent health. He does not handle many Southern horses, but those he does handle are usually taken up and put in the feed pen about November 1, or he may leave them on the wheat pasture and add a corn ration.

By using very large enclosures he avoids much injury from fighting. He states that this method of handling horses for the market has been very profitable with him.

The old method of stall-feeding horses is to give each horse a single stall, without any exercise whatever. Begin with a reasonable feed and gradually increase as the conditions of the animals justifies. Corn and alfalfa, or corn and clover, or corn with clover and timothy mixed are the regulation feeds. If clover or alfalfa cannot be supplied, a reasonable amount of bran might be substituted, with prairie hay or timothy hay. Each individual horse should be studied closely. The bowels are a guide to the quantity of feed required. A very offensive odor indicates that the digestive organs may be slightly over-taxed and the amount should be slightly diminished. The stalls should be kept clean and dry so as to avoid thrush in the feet, and the animal should be well bedded so that he will rest as much as possible. It is usually best to remove the shoes in a case of this kind in order to give the feet an opportunity to grow. This also prevents the difficulty from "shoe boils," caused when horses are forced to lie in very small quarters.

The mane or the foretop should not be trimmed. This should be left to experts. The horse buyer will arrange this or have it done. A light blanket may be used to make a good coat of hair.

The small feeder can usually do better by writing to the different horse commission firms in his territory, giving a description of the animals he has for sale, than to ship them, as a rule. He might also make inquiry as to other animals, so that a carload might be shipped from that section. This will encourage the buyers to visit this place.

When horses are stall-fed (and in fact, at all times), every horse feeder or breeder should have a clinical thermometer. When horses are closely confined they are very susceptible to influenza, or the so-called "barn fever," which is transmissible from one animal to another. One of the first symptoms of this condition is a rising temperature.

Market Classes of Mules.

Mules are usually divided into the different classes commonly known as cotton, sugar, mine and draft mules. Cotton and sugar mules should be ready for delivery in December, and not later than January. The demand for mine and draft mules usually begins with the opening of spring.

YOUNG MULES BEING FED BY A BOONE COUNTY, MISSOURI, FARMER.

Mules are more easily handled than horses for feeding purposes, as they are easily accustomed to full feed. A large number may be placed in one enclosure without much injury from fighting. When they are too mischievous a dark closed barn, with plenty of ventilation has been found very satisfactory. They do not "romp" as much in a small, dark enclosure as they might do in a large field.

The feed usually consists of a ration of oats, corn and bran, with an abundance of good hay. Where alfalfa or good clover is used, bran is not necessary. In feeding mules one must pay particular attention to the quality of hay to see that it is well cured. A mule is a great hay eater. It is profitable also to have water where they can get it at any time, as they do not naturally drink much water at any time unless forced to.

There is very little difficulty in finding a market for mules of any age or condition, so long as they are serviceably sound. But when high priced feed is to be used it should be fed to a promising animal. This is also true of any class of live stock. Slight blemishes are not so important in the market value of mules as it is with horses, so long as it does not interfere with the service. A good mule with only one good eye is a very salable animal, provided he is sound otherwise.

There are more mules fed in the state of Missouri than in any other state. Ohio feeds more draft horses than does any other state. There are sections in these two states that are recognized as "feeding stations." The feeders in these sections have made a study of preparing stock for market. It takes some study to know just what a thin anmal will develop into. A main point in the feeding business is to avoid being required to feed an animal too long. If the animal is in good flesh a short feed may be given which will finish the animal ready for market at a very small cost.

Another very important feature is not to purchase an animal that cannot be fattened in time for its particular market season. Such animals will not make much money, as the expense of feeding will be too great. The conditions under which horses and mules are fattened for sale may not add much to their general health, but in the market flesh is considered a necessity. Thin animals do not bring a fair market value.

Thin Animals Under Suspicion.

Purchasers either in the cities or in the South, or in public work, want to know what an animal will look like when he is fat, and again the question is asked, "why is this animal not in good flesh, coming from a district where feed is produced in abundance?" There are some animals that will not fatten and a thin animal is under suspicion of being one of these. Then again it requires a considerable flesh to withstand shipment and the change of occupation. If an animal has been fed well he will go into his new work usually with the digestive tract in good working operation; he will be able to consume considerable feed to meet the demands of hard work. Flesh rounds the animal up into a marketable condition. It will show to a better advantage.

The feeding of equines for market has been sadly neglected by the average farmer even to the extent of failing to properly fit his own surplus for selling. There are many who are glad to dispose of an animal in the fall after the work is done, even though the animal is thin. They do not seem to realize that the extra flesh greatly enhances the value of the animal. Too many men contend that they will save the feed in disposing of the animals early. There is no other class of live stock on the farms of this country that will net the same profit for the amount of feed consumed, when the animals are properly selected and fed with care.

We should like to see all stallion or jack owners study this proposition. They can be missionaries in this work even though they do not take advantage of it. Farmers can be en-

couraged to properly fit their horses and mules before they are offered for sale. Those who contemplate feeding stock of this kind may be at a loss to know where such animals may be purchased. Many of the Ohio feeders come west for their stock; while some are purchased in their own vicinities. The Missouri mule feeders canvass the Western states. Kansas is furnishing many good mules for the feeder trade. If the breeders in general over the country would give this subject a little thought, this stock could be fed in many localities without the extra shipping expense. In most of the sections where horses and mules are bred it should not be hard to find a reasonable number for this purpose.

Buying "Right" Essential to Success.

New feeders should be very careful about making the first purchases. This is one of the important parts of all transactions. An animal properly purchased is more liable to make a profit than one purchased near the danger line. This is where too many men fail. They see an animal that they would like to own, and regardless of the future, pay too much money for it. Individuals who cannot turn down a proposition should not engage in this occupation. The profit must be uppermost in one's mind to make a success of dealing in live stock. A resident in a vicinity might try to buy an animal at a particular time, and leave a standing offer, providing the animal remains in perfect condition. This frequently gets good results. There often comes a time in one's life when he needs money, and remembering that a particular animal can be sold on short notice, the transaction may be consummated.

Purchasers should be careful about animals that are not good feeders. Thin waisted, out-of-proportion stock will never get fat. An animal to flesh quickly must be well proportioned and have a capacity for consuming much feed and water. Occasionally an animal will not drink much water. Such animals should be fed a little salt in their feed separately until this condition is bettered.

It is usually a better plan for new beginners to purchase animals of a uniform type. Buyers are more easily attracted to a number of animals of one kind. Geldings are wanted for the city trade, while mare mules seem to have a preference in most of the mule classes, except miners. Mares may be handled for the farm trade, but producing mares are usually worth too much money in the country for feeders to handle. Some feeders make a specialty of keeping a record of sections where the crops are not good, believing that farmers will have a desire to dispose of all the surplus stock at a reasonable price. Some prefer to go into strange territory as it has been found that some men will sell their stock to a stranger to a better advantage than to a neighbor, believing that a professional buyer is better versed in the amount he can afford to pay, than some new man. One notices many peculiar conditions in such business, all of which require some thought.

In purchasing horses the breed is not considered so much as the market type. It is more a question of utility, and in filling the market requirements, little attention will be given to blood lines. At the leading horse markets the breed is seldom considered. The word "utility" means much in the actual value of an animal. This is the point that all breeders are striving for, yet many lose sight of it in thinking about blood lines. We do not believe that horse breeders could do better than to make a careful study of the market requirements of both horses and mules. There are many things that should be corrected in breeding live stock. Many notions are in existence that can be eliminated if breeders would study the word "utility" more carefully. The thought is that a particular type of animal will be able to perform the actual labor. He may not be able to fulfill the expectations, yet he is sold on the market for what he looks to be.

REMARKABLE SHOWING FOR CAPSULES.

To the American Breeder:—On June the 8th (at 11 o'clock at night), 1912, our big jack served a mare that was in the very middle of oestrum. As he dismounted I caught in a bowl less than one ounce of semen that was dripping from his penis, and went into the office and tested it. The test proving satisfactory, I decided to capsule two other mares and a large jennet that had arrived from a long distance, to be bred and pastured. Each of the latter proved too ill, and out of heat for several days, according to their owners. Failing to extract any semen from the mare served, before leaving the barn, I held the bowl containing the scant amount of less than an ounce (procured primarily for a test) until the other mares and jennet were placed in stalls, and divided the scant amount into three capsules and placed one in each uterus. Each mare capsuled has delivered a mare mule, three feet, seven inches at foaling, and the jennet delivered a jack colt, three feet, four inches, with 23-inch ears. The service mare failed to deliver, in the face of the fact that she had always been a regular breeder and the three latter had failed to conceive by this same jack in 1910, 11 and 12, twice each season up to June 8. One of the mares capsuled delivered May 17th, the other May 19th and the jennet June 9th, after being capsuled (out of heat) on June 8th, 1912. One mare that was capsuled (out of heat) last year on May 16th, delivered mare colt on May 20th. Another mare capsuled out of heat on April 29th, 1912, delivered mare mule on May 11th, 1913. We are collecting 17 per cent more foals this spring from capsule mares than from natural service mares.—Sam A. Leath, Washington County, Ark.

WORK HORSE PARADES BRING IMPROVEMENT.

The statistics of the recent Work Horse Parade in Boston disclose some interesting facts. There were 1,231 entries, and of these only 89 failed to appear, a much smaller percentage of absentees than is usual. There were 1,516 horses actually present. In the Boston parade every entry that deserves a ribbon receives one, and the ribbons were awarded as follows: 1st (blue) 765; 2d (red) 235; 3d (yellow) 51.

No horse that was lame, thin, or badly groomed received a ribbon, but the number thus disqualified was astonishingly small, being as follows: 17 for lameness, 16 for being thin, 6 for being badly groomed. These results show how much the horses in Boston have improved in quality and condition since the first annual parade ten years ago.

SEXTUPLETS AND TRIPLETS.

A news item from Maine tells of a cow owned by Thomas Williams of Weld, Maine, which recently gave birth to six calves at one time. This is declared to be the first instance of the kind ever known. The mother of the little animals was a grade of Durham and Hereford, while their sire was a full-blooded Holstein. Their combined weight at birth was 146 pounds, and they averaged about 25 pounds each. The calves lived only a few days.

W. H. Ryherd, who lives near Horton, Kas., has a cow which gave birth to three calves last April. At last account all the calves were doing well.

LIVE STOCK RECORD ASSOCIATIONS

The following list of the live stock record associations of the United States is perhaps the most accurate and up-to-date list available. As complete a list as possible was first carefully compiled and then submitted to every secretary of a live stock registry in the country for corrections and additions. This list should be preserved. —Ed.

HORSES.

American Trotting Register Association—William H. Knight, secretary, 137 South Ashland blvd., Chicago, Ill.

Arabian Horse Club of America—H. K. Bush-Brown, secretary, 1729 G street, N. W., Washington, D. C.

American Association of Importers and Breeders of Belgian Draft Horses—J. D. Conner, Jr., secretary, Wabash, Ind.

Cleveland Bay Society of America—R. P. Stericker, secretary, Aurora, Ill.

American Clydesdale Association—R. B. Ogilvie, secretary, Union Stock Yards, Chicago, Ill.

French Coach Horse Registry Company—T. E. McLaughlin, secretary, 1319 Wesley avenue, Columbus, Ohio.

French Coach Horse Society of America—Duncan E. Willet, secretary, Maple avenue and Harrison street, Oak Park, Ill.

National French Draft Horse Association of America—C. E. Stubbs, secretary, Fairfield, Ia.

German, Hanoverian and Oldenburg Coach Horse Association of America—J. Crouch, secretary, Lafayette, Ind.

American Hackney Horse Society—Gurney C. Gue, secretary, 460 Fulton avenue, Hempstead, L. I., N. Y.

American Morgan Register Association—T. E. Boyce, secretary, Middlebury, Vt.

Percheron Society of America—Wayne Dinsmore, secretary, Union Stock Yards, Chicago, Ill.

The American Breeders and Importers' Percheron Registry Company—J. A. Forney, secretary, Plainfield, Ohio.

American Saddle Horse Breeders' Association—Roger R. Lillard, secretary, Lawrenceburg, Ky.

American Shetland Pony Club—Miss Julia M. Wade, secretary, Lafayette, Ind.

American Shire Horse Association—Charles Burgess, Sr., secretary, Wenona, Ill.

American Suffolk Horse Association—A. Graham Galbraith, secretary, De Kalb, Ill.

The Jockey Club—W. H. Rowe, secretary, 6-8 East Forty-sixth street, New York, N. Y.

The Welsh Pony and Cob Society of America—J. H. Leet, secretary, Mantua, Ohio.

JACKS AND JENNETS.

Standard Jack and Jennet Registry of America—Wm. E. Morton, secretary, Scarritt building, Kansas City, Mo.

CATTLE.

Ayrshire Breeders' Association—C. M. Winslow, secretary-treasurer, Brandon, Vt.

American Galloway Breeders' Association—R. W. Brown, secretary, Carrollton, Mo.

American Guernsey Cattle Club—Wm. H. Caldwell, secretary, Peterboro, N. H.

American Hereford Cattle Breeders' Association—R. J. Kinzer, secretary, 1012 Baltimore avenue, Kansas City, Mo.

American Jersey Cattle Club—R. M. Gow, secretary, 324 West Twenty-third street, New York, N. Y.

American Kerry and Dexter Cattle Club—C. S. Plumb, secretary, Columbus, Ohio.

American Shorthorn Breeders' Association—Roy G. Groves, secretary, Union Stock Yards, Chicago, Ill.

American Aberdeen-Angus Breeders' Association—Charles Gray, secretary, Union Stock Yards, Chicago, Ill.

American Devon Cattle Club—L. P. Sisson, secretary, Charlottesville, Va.

Brown Swiss Cattle Breeders' Association—Ira Inman, secretary, Beloit, Wis.

Dutch Belted Cattle Association of America—E. J. Kirby, secretary, Covert, Mich.

Holstein-Friesian Association of America—Frederick L. Houghton, secretary, Brattleboro, Vt.

Polled Durham Breeders' Association—J. H. Martz, secretary, Greenville, Ohio.

Red Polled Cattle Club of America (inc.)—H. A. Martin, secretary, Gotham, Wis.

SHEEP.

American Cheviot Sheep Society—F. E. Dawley, secretary, Fayettville, N. Y.

American Cotswold Registry Association—F. W. Harding, secretary, Waukesha, Wis.

The Continental Dorset Club—Jos. E. Wing, secretary, Mechanicsburg, O.

American Hampshire Sheep Association—C. A. Tyler, secretary, 310 East Chicago street, Coldwater, Mich.

American Leicester Breeders' Association—A. J. Temple, secretary, Cameron, Ill.

National Lincoln Sheep Breeders' Association—Bert Smith, secretary, Charlotte, Mich.

American and Delaine Merino Record Association—S. M. Cleaver, secretary, Delaware, Ohio.

Dickinson Merino Sheep Record Company—Mrs. Beulah McDowell Miller, secretary, R. F. D. No. 2, New Berlin, Ohio.

Standard Delaine Merino Sheep Breeders' Association—R. M. Wood, secretary, Saline, Mich.

American Rambouillet Sheep Breeders' Association—Dwight Lincoln, secretary, Milford Center, Ohio.

International Von Homeyer Rambouillet Club—E. N. Ball, secretary, Hamburg, Mich.

American Oxford Down Record Association—W. A. Shafor, secretary, Hamilton, Ohio.

American Romney Breeders—Joseph E. Wing, secretary-treasurer, Mechanicsburg, Ohio.

American Shropshire Registry Association—Miss Julia M. Wade, secretary, Lafayette, Ind.

American Southdown Breeders' Association—Frank S. Springer, secretary, 510 East Monroe street, Springfield, Ill.

American Tunis Sheep Breeders' Association—Charles Rountree, secretary, Crawfordsville, Ind.

HOGS.

American Berkshire Association—Frank S. Springer, secretary, 510 E. Monroe street, Springfield, Ill.

Cheshire Swine Breeders' Association—Ed S. Hill, secretary, Freeville, N. Y.

O. I. C. Swine Breeders' Association—O. C. Vernon, secretary, Goshen, Ind.

Chester White Swine Record Association—F. F. Moore, secretary, Rochester, Ind.

American Duroc Jersey Swine Breeders' Association—Robert J. Evans, secretary, Union Stock Yards, Chicago, Ill.

National Duroc Jersey Record Association—J. R. Pfander, secretary, Peoria, Ill.

American Hampshire Swine Record Association—E. C. Stone, secretary, 703 East Nebraska avenue, Peoria, Ill.

The American Large Black Pig Society—J. F. Cook, secretary, Lexington, Ky.

American Poland China Record Association—W. M. McFadden, secretary, Union Stock Yards, Chicago, Ill.

National Poland China Record Company—A. M. Brown, secretary, Moor-

man Block, Winchester, Ind.

Standard Poland China Record Association—George F. Woodworth, secretary, Maryville, Mo.

American Tamworth Swine Record Association—E. N. Ball, secretary, Hamburg, Mich.

American Yorkshire Club—Harry G. Krum, secretary, White Bear Lake, Minn. .

National Mulefoot Hog Record Association—G. C. Kreglow, secretary, Ada, Ohio.

Mulefoot Hog Breeders' Association—D. D. Gilson, president, Mammoth Springs, Ark.

American Mulefoot Hog Record Company—R. E. Pfeiffer, secretary, Chamber of Commerce, Columbus, Ohio.

GOATS.

American Angora Goat Breeders' Association—R. C. Johnston, secretary, 639 Tennessee street, Lawrence, Kas.

American Milch Goat Record Association—J. C. Darst, secretary, Dayton, Ohio.

THE NEW JACK STUD BOOK.

Volume 1 of the Standard Jack and Jennet Registry of America is now ready for distribution. This first volume has 4,000 animals registered in it and a good start on another volume. This first volume probably contains more living animals than all other jack records in America combined.

This association has already been recognized by some of the stallion registration boards, and probably will be recognized by all of them in the very near future. The great success this record has made justifies the confidence of the big majority of jack breeders who wish to have their stock registered in an association that will grow and prosper.

The price of Volume 1 of the Stud Book is $2.00 to members and $3.00 to non-members. A membership costs $10, which entitles the stockholder to register his stock at half price, $1.00.

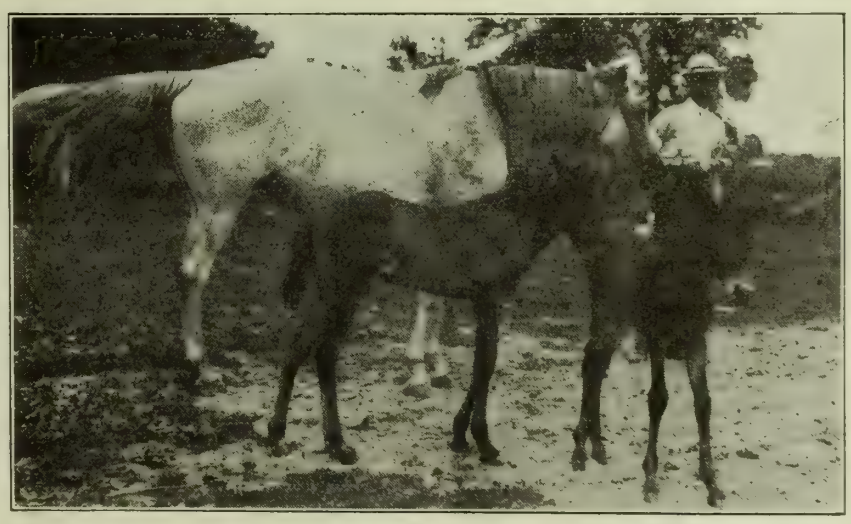
Those who wish to have their stock registered in Volume 2, should write to Wm. E. Morton, Sec'y, 920 Scarritt Bldg., Kansas City, Mo., for application blanks, and have their stock registered soon. Following are the present rules:

RULES OF ENTRY.

1. Pedigree must give name, color, sex, year foaled in, and name and address of owner.
2. Jacks must measure 58 inches or more from the highest central part of the withers to the ground and measure 62 inches or more around the heart girth in average condition, and have 7 inches or more measurement around the front leg at the smallest place between the ankle and knee (the leg to be normal size).
3. Jennets must measure 56 inches or more from the highest central part of the withers to the ground, and measure 60 inches or more around the heart girth in average condition, and have 6¾ inches or more measurement around the front leg at the smallest place between the ankle and knee (the leg to be normal size).
4. Any color admitted, provided they comply with Rules 2 and 3.
5. Young undeveloped jacks and jennets may be registered when their sire and dam are registered in this Registry, provided the sire fills the above measurements. This will make a uniform type.
6. Each application must give exact measurements of foundation stock, so the certificate cannot be handed out with another animal.
7. Each application must be sworn to before a notary public or justice of the peace.
8. You can give the sire and dam names (barn names) for foundation stock.
9. This Registry will not recognize any other jack registry unless the animal meets the requirements of this Registry.
10. The fee for registering jacks and jennets in the Standard Jack and Jennet Registry of America shall be one dollar to stockholders and two dollars to non-stockholders for each animal registered. The fee for transfers shall be one dollar for each animal transferred. The fee in all cases to accompany the application. Each transfer shall be recorded before the offspring can be registered.

NOTE—We are now registering jacks and jennets that fill certain requirements as foundation stock, and it is not necessary to have the sire and dam registered or their ancestry traced, provided the animal fills the requirements of this Registry as given in the Rules of Entry.

Each Stud Book will have a standard sire list, showing the exact measurements and colors of all sires. These stud books will be sold cheap so that everyone interested can own one and know the qualities of the sires. For the advancement of a breed it is necessary to use good sires.



THE AMERICAN BREEDER JACK SHOW.

Because of the fact that the general public is requiring more information concerning jack conformation, we started the plan of holding a "jack show" in the paper. In this exhibit breeders from several states are presenting photographs of jacks that are valued highly in their localities.

About one-fourth of the mares in the United States are being bred to jacks. For this reason it is important that mare owners, as well as breeders, study jack conformation. The method we have adopted for teaching conformation is not perfect, but it has the advantage of being practical and interesting. The judges in this contest (three experienced jack breeders) will base their decisions upon the photographs, and the statements of the jack owners, as printed in the American Breeder, and will not be given the names of any of the jacks or owners. The judges will not have the opportunity to inspect these animals. Their decisions will be announced in a later issue. Everyone should keep this copy of the American Breeder and study the pictures and measurements, both independently and in connection with the judges' awards. As soon as the result of the judging has been announced we will publish the names of the owners (and of the jacks also) to correspond with the entry numbers by which each jack is designated in the pictures which appear on pages 8, 9 and 10.

THREE SERVICES; HORSE AND MULE TWINS.

To the American Breeder:—I have a mare that gave birth to twins, a mule and a horse colt. When they were two weeks old the mule weighed 60 pounds and the horse colt 75 pounds. The dam is a good mare ten years old, and has been a regular breeder. She was bred last year as follows: June 13 to the jack; July 3 to the jack and horse; July 23 to horse. Colts were born June 5. Colt born at four p. m. and mule at 5 p. m. Both are doing fine and I have a man that is going to show them for me. Both have a black stripe down the back and over the withers. The dam paces and so do both colts. Am mailing you photo of them.—J. A. Hart, Clinton County, Ind.

MARE BELONGING TO J. A. HART, KIRKLIN, IND., WITH TWIN COLTS. ONE A MULE, THE OTHER A HORSE.

Denmark buys our mill feeds and sells $40,000,000 of dairy products to Great Britain.—United States Department of Agriculture Report.

Questions and Answers

Questions from subscribers, on any phase of live stock production—breeding, feeding or the treatment of injury or disease—will be answered under this heading, free of charge. No questions will be answered by mail, but we make the service through the American Breeder, giving inquirers the help of the best authorities in the country, free, because the problems of one reader are likely to be of interest to all. As knowledge of location is sometimes necessary to a proper understanding of the answer, we give the state from which the inquiry comes, but names and postoffices are withheld, making it safe for subscribers to ask questions of a confidential nature whenever they wish.

Do not make your question a part of a letter; write it on a separate sheet of paper. Send in your questions every time something comes up you need to know; we are glad to have them.

CROOKED FETLOCK—Please let me know what is best to do for young mule colt four days old. One of the front feet turns under at the ankle. It seems so limber. When it stands still its foot is all right, but when it walks the foot turns back. I tried splints on it, but it is a job to keep them tied on. How would a plaster paris cast do, and how would a person go about it? It is a fine colt. Is there any liniment that would strengthen the joint?—Colorado Subscriber.

REPLY—It is quite likely this fetlock would gain strength by twice daily rubbing with dilute alcohol, but if the colt knuckles badly you can hurry up matters by having a plaster cast applied, which should be done by your veterinarian or some one that has had experience in matters of this kind. The parts should be carefully protected with layers of cotton before the plaster paris bandage is run on and the limb should be supported in proper position by means of splints until the cast is set. The cast may be left on two or three weeks and if on examining the parts they are not yet strong, it may be reapplied.

NAVEL ILL—There are two or three colts that at ten hours to two weeks old had swollen stifles, and hock joints swelled. Some of the owners thought that their backs were weak till the bunches showed on them; some of them thought that the mothers had stepped on them. Some of them, the water would drop from the navel and some would dry up, but there would be a swelling about the size of an egg and appear to be hard. Some of them die and some of them live, but when they live their stifles stay large and crack when they walk. They do not seem to have good use of their hind legs. Can you tell me the cause of this trouble or some remedy that will help them?—New York Subscriber.

REPLY—If you have been a reader of the American Breeder in the past, you no doubt have seen numerous articles and inquiries on the above disease. It is an infection brought about by the entrance of poisonous germs at the point of the wounded navel or umbilicus, and as a disease is very difficult to cure. The best way to handle the problem of navel ill is by way of prevention, which consists preferably of applying a drying antiseptic powder to the parts at rather frequent intervals until the parts are dry. Much can be done in the way of prevention by using bacterin.

HORSE DOES NOT SWEAT—I have a large black horse that seems in good health every way except that he does not sweat at all, even in the hottest kind of weather; when he is doing hard work he will hardly wet the hair under the harness. This is a family horse and has the best of attention. A few days ago we thought that his sheath was foul; washed it out, using a bran mash. It was not as bad as we expected it to be. He seems constipated, gave him a dose of aloes, one ounce; did not seem to have any effect. Have changed his feed from straight oats to oats and bran, wet.—Texas Subscriber.

REPLY—Horses that do not sweat during the hot season of the year are usually more or less affected by the heat, which is to be feared in your case. If possible, give your animal access to grass or feed some kind of green or succulent food. Encourage a more lax state of the bowels by feeding loosening food. Do not feed so heavily on heating grains during the hot period of the year. By giving the matter of diet a little study, you ought to improve the condition complained of.

SORE ON PENIS—What would you do for a stallion that has a small sore on his penis, about eight inches from the end? I am not breeding this stallion, and have not since I noticed it. I use a wash on it, but it does not seem to do better, yet it is a week old. Could this be a "dose," or something to that effect? I always wash my stallion after every cover, therefore, I cannot account for this. Now, if you think this is a bad case let me know, and what you would do in a case of this kind. I have taken care of stallions seven seasons and this is the first time I ever had to lay a stallion up. This sore is about the size of a ten cent piece, and red.—Minnesota Subscriber.

REPLY—Touch the part daily with a three per cent silver nitrate solution, and before allowing the penis to retract into the sheath, dash a little salt solution on the part, after waiting a couple of minutes. Wash the wound off carefully the following day with sterilized water before making another application.

LAME MARE—I have a mare five years old; weighs 1,650 pounds. She foaled a colt the 3d of June and I haven't worked her since. About three weeks ago she began to limp a little in the front ankle and has grown worse ever since. I blistered her ankle and used lots of liniment, but does not seem to do much good. Can you tell me what to do?—Oklahoma Subscriber.

REPLY—We fear you have not succeeded in locating the difficulty, as a case of lameness beginning slightly as you say should have been arrested by the measures you have used. Have a qualified veterinarian look this case over carefully for you.

SYNOVITIS—I have a horse that was cut on a wire fence the 28th of May; was cut in front of the hock joint of the right hind leg. It was only a deep skin wound and it bled quite freely, but as soon as we got the blood stopped we doctored it with some good liniment. The skin is healed up now, but the joint is swollen some. He commenced holding that foot up right away, and still holds it up. We can't get him to put any weight on it. If we hold another foot up he will fall down rather than stand on that one. We have been bathing it with liniment and rubbing it sharply, but it seems to do no good. Now what can I do to get him to use it? Or what could have been done at first to make him use it? The sore did well all the time.—New Mexico Subscriber.

REPLY—We fear the injury was deeper than you think and that the joint suffered at the time of the wire experience. The injury might have been in the nature of bruising the parts, which set up an inflammation of the synovial apparatus, giving rise to a very painful condition. Make use of some of the blistering preparations suggested under other inquiries in this column.

GOVERNMENT OWNED SIRES.

The Canadian government has started to furnish sires for the improvement of live stock in that country. A proposition of this kind might apply to some section where there were no sires of any value, but in this country we do not believe that that plan should be encouraged, neither do we expect to see our sister country succeed with this method of doing business unless that country wishes to displace practically all of the sires which are kept for public service. It is not a rational proposition to think that an individual would care to be in competition in the breeding business with the government.

There is plenty of money in this country and any number of individuals ready to invest in the breeding industry when it is proven that is is profitable.

Practically all of the stallions owned by the different governments are kept for the propagation of army horses. In considering any undertaking, its probable success should be considered the vital test of its advisability. In this respect we call to mind the Belgian government, in its draft horse operations. No other breed of live stock has made greater progress during the last decade than the Belgian horse, yet Belgium does not seek to own any sires. That government pensions certain horses with the provision that such sires shall remain in the country for a given length of time—usually about five years. If the stallion leaves the country before the stipulated time, all that has been received must be refunded. This is the reason that many of the most noted sires in Belgium have not been imported to this country. But as a result, those prominent sires have been used extensively at home. Belgian breeders appreciate the value of top crosses by exceptional sires.

Every year at the Belgian horse show, held in Brussels, there are shown about 1,000 draft horses, that for the number are very hard to duplicate anywhere, both weight and quality considered.

In addition to the pension offered by that government for outstanding individuals, those high up officially recognize this industry and encourage it by their presence at the leading shows and agricultural gatherings. What improved live stock breeders need everywhere is more encouragement, and not necessarily government owned sires.

RECOGNIZED RECORD ASSOCIATIONS.

For many years the Bureau of Animal Industry had full supervision over certain record associations. Any organization seeking recognition was required to furnish a stud book at least every four years. Complaints were investigated by the government officials. Imported live stock had to be first registered in a recognized record association before it was admitted to this country free of duty. In 1909 and 1910 a Percheron breeder was questioned, and, according to government reports, this breeder could not furnish satisfactory evidence concerning animals he had registered in the Percheron Society of America. The Bureau of Animal Industry contended that this matter should be straightened out, but it was decided that the law controlling this association was not sufficient to force a satisfactory adjustment, so that, on January 1, 1911, as a way out of the difficulty, government recognition was withdrawn from all American associations, and only such foreign associations as meet the requirements of the Bureau of Animal Industry are now recognized by the United States government. Since January 1, 1911, the government has given little attention to the American live stock record associations.

We are printing elsewhere in this issue a list of live stock record associations. The list is large, and necessarily there are some on the list about which we know very little. If any reader can give a satisfactory reason why any of these associations should not be given this publicity, we will appreciate such information. If there are any other associations that are authentic and are being conducted by the breeders for the purpose of increasing the quality and reliability of a class of live stock, we will be glad to add such associations to the list.

A PERCHERON STALLION FOR SALE.

One of our subscribers writes that he has a fine imported Percheron stallion, eight years old, that has done well in his vicinity, but must change on account of fillies. He asks us for a method of disposing of this stallion, and about the possible cost.

Hundreds of stallions have been sold by advertising in this paper at a very small cost. An advertisement can be placed in one inch space, which costs only $2.80 for one time and $5.00 for two times. One insertion sometimes makes a sale and $2.80 will not feed an animal very long. A good description should be given of the animal to be advertised. From 30 to 50 words can be put in an ad of this size. The fewer words the better they can be displayed. We always fix the ad up so that it reads all right when requested.

A lot of men will buy high class breeding stock this fall and winter, and sellers who get their ads in early will have first chance at these select buyers. People who have stock of any kind to dispose of find it profitable to place these small advertisements in this paper. Those who have not tried it should consider this proposition seriously, and especially those who have carried over stock that has not netted them any revenue, sometimes decreasing in value while increasing in age.

High Cost of Living

This article will deal with the high cost of living and not with the cost of high living. Nearly every town of any size is said to have a "Retail Merchants' Association." These organizations are not always so well perfected that they would be known as such, but a general understanding seems to exist, and seems to regulate the prices satisfactorily to the members.

Not long ago potatoes were selling at 25 cents a bushel, delivered to the merchants in a certain city. Those merchants retailed those potatoes at from $1 to $1.50 a bushel. The farmers were not to blame for this transaction, neither were the purchasers. There was little use to change from one store to another, for the prices seemed high enough at any of them. In such cases, where business men combine, the public has a very poor opportunity to discover the exact condition. There are not many business men in a given locality that wish to attract the enmity of this class. It is usually much worse in the larger cities. If an individual should not affiliate himself with such an association, then his difficulty might begin. Traveling salesmen might forget to call on him, and if necessary the delivery of goods might become very irregular. This is only a hint as to the method employed in driving a merchant or firm into such an organization. It is being done every day.

In some of the smaller cities where the competition is severe, the association may not have strength enough to control the prices of products in all cases.

It is these high prices that have wonderfully helped the mail order houses. These institutions can stand alone without such an organization, as their prices and method of doing business, as a rule, have been very satisfactory to the purchasers. The best mail order houses are growing by leaps and bounds. Many new purchasers are being added to the mail order list each day. They are thinking about it; they are wondering in many localities why the prices are so extremely high at their home store.

Merchants who go too far with these price-boosting organizations are driving themselves out of business as rapidly as possible. The American people are sometimes slow to comprehend, but they usually locate the difficulty sooner or later.

We have always contended that the home merchants should be patronized when consistent, as they are in position to do much toward helping and encouraging public improvements, but where these individuals combine for the purpose of charging exhorbitant prices, it seems to us that other channels must be opened to buyers. There are many men and firms, members of retail organizations, that are not in sympathy with the movement, but the method used in forcing the life of such an organization sometimes mean that they must either join or go out of business.

There is another feature of this subject that should be made mention of. As a community's mail order business grows, the business it does with the ordinary retail firms must be curtailed; their expenses will be continued and as the business diminishes the price of the product must be advanced to meet actual cost, at least, regardless of any effort to boost the price, so that in the future only such merchants as have a full volume of business can meet their other expenses without increasing the cost price.

On various occasions a few public spirited citizens have tried to break up such retail organizations. In one case in particular the mayor of a large city made considerable progress, but the public did not grasp the situation in time to be of much service. It was new to them and they had not given the subject much thought. They believed, of course, that their old retail merchant whom they had traded with for years would not try to boost the prices beyond the point of reason, but after the mayor had spent a fortune in trying to help them, they then realized their mistake in not giving more assistance.

The public is a peculiar thing to do business with. Such attempts seem to be cases where it is everybody's business and nobody's in particular to attend to it.

Another obstacle to the successful solution of this problem is found in that class of people who never seem to have enough money to pay cash, but must continually have credit. This is not found so much among country folks as it is among the laboring classes in large cities. These classes will not be in position to help themselves until they learn to get ahead enough to pay cash for their provisions, at least. There are more people living on credit than the average man thinks for. This is one of the blinds behind which the retailer hides the real meaning of big prices. He claims that he must lose considerable money in collections, consequently prices must be high enough to still net a profit. This is still another point by which the mail order houses have an advantage and can actually sell goods cheaper than the average firm that does a credit business.

The new parcel post is doing much to rectify this difficulty. Farmers, especially, have reaped a reward both ways by using the parcel post. Practically every farmer is acquainted with some citizen in a city that would be glad to have his products. After a little correspondence a few regular customers can be established. Regular parcel post crates and containers are now being placed on the market and goods can be dispatched with safety and haste. Farmers living out 50 or 100 miles, or even farther, can send their products by mail and have them delivered the next morning, with very little expense. After August 15 20 pounds can be sent by parcel post and a cash business can be done. The goods can be sent C. O. D. The shipment can be insured. Five cents will insure $25 worth; between $25 and $50 will cost 10 cents, so there is very little risk to run. The purchaser can write a postal card to his farmer friend ordering certain goods and the next mail it can be shipped with safety. He also knows that if the goods are delivered the postoffice department will collect the price agreed on, so there will not be any necessity for doing a credit business.

The parcel post proposition is here to stay; it has been tried and found satisfactory. It has made the postoffice department lots of money, and a reduction in the price of shipment can be expected in the near future. Not only is this a cheap and effective way of doing business for the average citizen, but the farmers living on rural routes can have access to the entire country with rapidity.

Postmaster General Burleson states that in his opinion the parcel post service will carry practically all of the small packages dispatched in this country. He further states that he believes that the weight will be increased to 100 pounds in the very near future.

Purchasers are finding it very convenient to order goods from either their local merchants or from the mail order houses by parcel post. An order so sent is filled and arrives in due time, delivered at the buyer's door. The rural free delivery has made a marvelous growth, now cover-

ing most of the well settled districts. Any firm that expects to stay in business will make deliveries promptly and up to expectations. Most of these advertisers contend that a satisfied customer is the best possible advertising. It would not be profitable for any firm to stay in the mail order business, as a rule, that did not make its sales satisfactory. The average cost of securing new customers would in most cases be too great if there was not more business to follow the original sale.

Many mail order merchants have for some time shown their confidence in the honesty of those who buy through live stock and farm paper advertising by sending some articles on approval, on trial. Buyers can get almost anything from them C. O. D.

A careful study of mail order buying can be very profitably made by the average purchaser.

PREPARING COLTS FOR EXHIBITION.

The necessity for halter breaking colts at a very early age is recognized by all who show colts. They are easily conquered at that time and it does not retard their growth. No matter how good a colt may be, judges do not feel kindly toward a "wild west" exhibition at colt shows. With a little preparation they can be taught to stand quietly and in a good position, so as to show up the different parts to the best advantage.

A well broken colt is more easily prepared for showing. The proper time to begin the preparation of a young animal is soon after birth. The mare should be abundantly fed so that she will produce as much milk as possible. During the first few weeks of life colts can be taught to eat oats, but it is through the milk supply that the stomach is kept in good working condition. As the colt grows older it gradually becomes immune to certain kinds of bacteria, that might cause serious disturbance in the digestive tract were it not for the abundant supply of milk from the dam. As age advances, too, the colt can consume more feed, and a self feeder should be arranged so the colt could run to it and eat at its leisure. Let the colt regulate the amount it wants. There will be little danger of sickness on account of feed while the colt is nursing, provided the colt is not kept away from feed too long at a time. The feed, however, should be of a good quality, and free from dust or mold.

The above statement as to milk refers to a mare kept for the exclusive purpose of thoroughly developing the foal, and not used for labor. In case the mare is worked and allowed to get very warm, some poison from her system will be eliminated through the milk supply, which might affect the colt. Good pasture is important in a case of this kind, but it is not sufficient for thoroughly developing the foal. Two or three good feeds of oats each day are necessary while the progeny is developed to the limit.

Where a mare suckles a foal on grass only, the colt may look round and plump, yet be very soft; neither will it develop as rapidly as in the case of a mare receiving a good supply of oats.

A very successful colt exhibitor has a basement barn which is very cool; it is also dark and there the flies do not bother the stock. The mare and colt are kept in the basement during the day time and fed alfalfa and oats, and are turned in the pasture at night for exercise. A plan of this kind might well be studied by many who wish to thoroughly develop young stock.

Some colts mature more quickly than others, but at about five months of age is the best time to show a colt so far as its balanced form is concerned. They are usually better proportioned at this time than at any other. Earlier colts, having more size and weight, are sometimes mistakenly placed above younger animals with more merit. Age should always be considered in colt shows. The judge expects to enjoy the favor of his decision from the ring side; should he favor a smaller colt, the inexperienced might not understand his judgment.

There should be two classes in colt shows, the draft and roadster. There might be further divisions among the different light breeds. There should not be an "all purpose class." No breeder should encourage a class of this kind. There are too many all purpose horses on the market now, that are produced when something better was intended. Every breeder should try to produce an animal that fills the highest market requirements.

A STALLION BUYER COMPLAINS.

A reader states that he purchased a very fleshy stallion in June, and that it is not settling his mares satisfactorily. He has been making two services a day with it from the start.

This is too many services for any ordinary stallion. This stallion might make one service a day, by occasionally skipping a day. The microscope should be used to tell whether it is fertile or not.

This is another very good lesson for everyone who intends to purchase breeding stock—purchase early and get the stock in breeding condition. Those who expect to buy stock can well afford to investigate such purchases in the fall, and the earlier the better. This is a problem that both purchaser and seller can study with profit.

Those who have stock to sell will do well to advertise it in the very near future. The best buyers are on the lookout for the kind of animals that suit their fancy. They are not waiting to try to save a few dollars in feed and lose a lot of valuable service. They wish to get their animals home so that they can be advertised—taken to the public gatherings in that vicinity where people may have an opportunity to look them over. This stock can be bought for less money in the fall than it can in the spring, because there is a great saving in feed to the seller—enough to enable the purchaser to pay the expense of maintenance until the stock is ready to use.

We should like to urge everyone who has stock to sell, or stock to buy, to investigate this problem early.

PRIVATE SANITARIUMS.

One of our readers who has been a very hard worker is reported as being sligthly unbalanced. His wife writes us for our advice concerning this case. The individual in question is well fixed. His folks do not want to have it publicly known that his mind is affected. He is not violent nor dangerous, but it seems to be the result of a nervous break-down. We are asked whether it is best to send him to a private sanitarium or keep him at home, or send him to a public institution.

We would advise our friends to steer clear of the so called private sanitariums, as a rule. These places are usually run for private gain, and the treatment is not always the best. Too often the profit in the case (especially when the patient is wealthy) is by far of the most importance to the owners of such institutions. They may not all be unworthy, but some very bad reports have been circulated concerning some of them.

An unscrupulous individual may not be very quick to release a good, profitable patient. Our advice in a case of this kind would be to take this man to a nerve specialist, recommended by the family physician, provided he is of a good moral character, and a man to be depended upon. Cases of this kind must be treated by men who have a higher ambition than receiving a paltry dollar. An unscrupulous physician should be avoided at all times, for he is very dangerous.

Rest, proper nutrition and the best medical assistance, with a good nurse, should do much for this man. If everything else fails, we would advise taking him to the insane aslyum in the state where he lives.

Be an Auctioneer

AUGUST 4
NEXT TERM BEGINS.

This is the School that gives you the actual practice and equips you for the best money making profession in the world—time and expense of preparation considered.

For full particulars, address,

W. B. CARPENTER, Pres.
Missouri Auction School.

14th and Grand Ave.,
KANSAS CITY, MISSOURI.

LEARN AUCTIONEERING

at World's Greatest School and become independent. The best of Instructors and Lecturers. Col. Carey M. Jones, America's leading draft horse Auctioneer, instructor in pure bred stock sales. Summer term opens July 28th. Write today for catalogue, mentioning American Breeder. **Jones National School of Auctioneering. No. 1 N. Sacramento Blvd., Chicago, Ill.**

The James Milliken University

A Christian College, offering full Classical and Technical Courses. Seven fine new buildings, including ladies' dormitory, all with modern equipment. Co-educational. Superior Faculty. Expenses Low. Over 1000 students last year. For catalog, address.

A. R. Taylor, President, Decatur, Ill.

Your Son and Daughter

Will enjoy the summer in the OZARKS. Why not let them attend a practical business training school this summer and fall, where the climate is worth the money? Training for business or position. If interested investigate.

Fayetteville Commercial College, Fayetteville, Ark.

SHORTHAND IN 30 DAYS

We absolutely guarantee to teach shorthand complete in only thirty days. You can learn in spare time in your own home, no matter where you live. No need to spend months as with old systems. **Boyd's Syllable System** is easy to learn—easy to write—easy to read. Simple. Practical. Speedy. Sure. No ruled lines—no positions—no shading, as in other systems. No long list of word signs to confuse. ONLY NINE CHARACTERS to learn and you have the entire English (or any other) language at your ABSOLUTE COMMAND. The best system for stenographers, private secretaries, newspaper reporters, lawyers, ministers, teachers, physicians, literary folk and business men may now learn shorthand for their own use. Does not take continual daily practice as with other systems. Our graduates hold high-grade positions everywhere. Send to-day for booklets, testimonials, guarantee offer, etc.

CHICAGO CORRESPONDENCE SCHOOLS

Large Demand for Power

Heat Stiffens Horse Market But May Start Cattle Runs Soon. Good Beeves Stay High. Hogs Hold to $9 On Scarcity. Sheep Up and Down.

Demand for horses and mules continues broader than the usual July requirements. Heat and dry weather together with the rush of threshing, moving grain, cotton, and fruits, limits horse power on the one hand and expands the requirements for it on the other. Dealers who usually take vacations in July, have postponed visits until August, and then they will do half time on the rest game. Prices are $10 to $15 a head higher than the first week in July, and about up to the season's average. The supply of heavy drafters has been small, and demand was checked on that account. A well matched team of good heavy horses is worth as much now as anytime. The bulk of the offerings has been the medium classes of horses. Most of them are thin and straight from work. In this connection it is wise to note that a week to ten days' rest for a horse that has been at heavy work all summer adds considerable to the animal's looks and selling price. Speculators are operating on current supplies, especially that part that shows some quality, but are jaded from a season's work. Two weeks of the right kind of treatment makes them appear like fresh animals. Capitalizing vigor is one of the big stocks in trade with a horse scalper, and the idea of making a buyer see the good points, to the exclusion of poor points, is the livelihood of many.

Late August is set as the time for a general expansion in demand. The movement of Southern crops together with the general fall farm work asserts its requirements up to the latter part of October. City trade is also revived. Mines are opened and together horse power requirements are large. Feeder buyers are looking the market over now, but in most cases are awaiting larger supplies. Last winter's feeding operations were so successful that dealings along this line will be large, provided that grain prices do not reach prohibitive levels. The fall run will be fairly liberal, as farmers in some cases will sell old horses to make way for the oncoming young stock. Mules are expected to sell well all fall. The average mule now is of much better quality than ten years ago, and he has become popular for city use, and is an actual requirement in construction work. City trade requires the large footed kind, because they get over the pavements better, and are less liable to get hung up in openings along car tracks. Other classes of work make less foot distinction. The South has a big cotton crop, and with this the third large yield in succession, it is in a position to make general expansion along all lines.

The following quotations are for serviceably sound horses and mules 4 to 7 years old:

Horses—	
Draft, choice, 1600 lbs. up	$250@285
Drafters, fair to good	165@245
Chunks, good to choice	135@175
Chunks, fair to good	100@135
Expressers and light draft	75@140
Plain workers	40@ 85
Southerns, good	135@160
Southerns, plain to fair	75@130
Plugs	20@ 60
Mules—	
13 to 14 hands	$ 85@125
14 to 15½ hands	115@165
15½ to 16 hands	165@225
16 to 16½ hands	220@290

Big Cattle Run Delayed.

For two weeks past the trade has been expecting an avalanche of cattle to hit the market. Such a condition has not materialized, but is still expected. Kansas and parts of Oklahoma have been very dry since May. Some good rains have fallen in spots, but the high temperatures of the past few days has dissipated them rapidly, and now grass generally in that state is short of requirements for fattening purposes. Pasture men have fought against odds all season, and though they have not given up hopes of a general rain, shipments will be compelled unless the close of this week brings general relief. The market under such expectations has been nervous. Fed steers have been firm, owing to the belief that advancing corn prices, and curtailed weight in cattle, owing to grass shortage, will result in a general scarcity of beef. Prime steers are selling at $8.75 to $9 at river markets, and as high as $9.20 in Chicago. The first Montana grassers of the season were received in Chicago Monday. They were said to be rather plain in quality, and (that considered) prices were as high as last year. At the river markets the movement from below the quarantine line continues liberal. Such steers are selling at $5@7.50, and the Kansas grass steers are bringing $6.50@7.85. The bulk of the native fed steers are selling at $8@8.65. July is showing its usual adaptability for cleaning up the odds and ends, and inferior quality. A good many half fat steers are selling at $7@7.25, that would bring a quarter more from country buyers if they had better quality. Clinton county, Missouri, has been marketing a large number of well fattened steers at $8.50@9. Since the last week in June that one section has shipped out nearly 7,000 cattle, and they still have 4,000 on feed. The Northwest is in a position to hold their cattle should the market show a slump. Those cattle, however, are not as plentiful as in former years, and the lake market will be eager to care for all she can get. Montana now has the option of shipping to the coast or interior markets.

Quotations for the various grades of killing steers are as follows:

Prime corn fat steers	$8.75@9.00
Good to choice steers	8.35@8.70
Fair to good steers	7.85@8.30
Common to fair steers	6.25@7.80
Meal fed, choice	7.75@8.35
Meal fed, common to fair	6.50@7.75

Dry Lot Butcher Cattle High.

In the past week straight heifers, steers and heifers mixed, and yearling steers, sold up to $8.95, the highes price this season. Some mixed grades at $8.70 lacked about thirty days of prime finish, and from there down to $7.50 dry feed became unnoticeable. Some fat grassers sold as high as $7.85, but most of the heavy heifers were rather paunchy. The general trade still requires fancy light cuts of beef, and the baby bovine crop has just about been gathered in. Cows and heavy butcher cattle are selling readily at firm prices. Killers have bought freely, and the price quotations show a considerable spread. Cows are selling at $3.85@7.25, and heifers $4.50@8.95. Veal calves are in active demand. Top price at river markets is up to $10, and as high as $11.25 was paid in Chicago.

No. 22—13 yrs.; 63 in. high; 68 in. heart; 10 in. bone.

The following quotations are for the various grades of butcher cattle:

Cows—	
Choice	$6.50@ 7.25
Fair to good	5.50@ 6.45
Common to fair	4.75@ 5.45
Canners	3.75@ 4.70
Heifers—	
Choice fed	8.25@ 8.95
Good to choice	7.75@ 8.25
Plain to fair	6.50@ 7.70
Common	5.50@ 6.45
Veal calves	6.50@10.00
Bulls	3.75@ 6.85

Collapse and Recovery in Thin Cattle.

Two weeks ago prices for stock and feeding cattle broke on the reports of continued dry weather, and the belief that shipments would be forced from the West. No big movement materialized as rains fell at opportune time. The expectation of increased supplies brought out increased demand, and prices were advanced rapidly and are now back to nearly the high level for good kinds, but the common kinds are meeting some discrimination. The parts of the country that are well off for water and grass are buying freely, and sections less favored are holding on to their thin cattle as long as possible. Prices show a wide range, though not unreasonable for this time of the year. Feeders are bringing $6.50@8, stockers $5.50@7.90. All breeding cattle are in urgent request.

The following quotations are for stock and feeding cattle:

Selected feeders	$7.65@ 8.00
Good to choice feeders	7.35@ 7.60
Plain to fair feeders	6.75@ 7.30
Selected stockers	7.50@ 7.90
Good to choice stockers	7.00@ 7.45
Plain to fair stockers	5.50@ 6.95
Stock calves	6.25@ 8.00
Stock cows	4.25@ 5.75
Stock heifers	5.00@ 6.80
Milch cows	35.00@90.00

Nine Dollar Hog Market Continues.

Most of the time in the past two weeks hog prices were above $9. The top price paid in Chicago was $9.62½, in St. Louis $9.55, and in Kansas City $9.25. The hot weather in the past

Alfalfa As a Money Maker

Rich alluvial soil is what is wanted for the successful growing of Alfalfa, the king of forage crops. The Red River Valley has this kind of soil in abundance—nothing better anywhere. We can recommend this land to well-to-do farmers who want something really good. Ample rainfall.

Wood Shingles Won't DO!

In this **20th Century AGE OF STEEL**, wood shingles are fast disappearing. They cost too much; they rot out too quickly; too much trouble to put on; too apt to catch fire. That's why 100,000 men have come to put these beautiful **Edwards STEEL** Shingles on their buildings.

Edwards Steel Shingles **never** burn nor rot. Come in big clusters of 100 or more, which makes them ten times as easy to put on as **wood** shingles. Each Edwards **STEEL** Shingle is dipped in **molten zinc AFTER** it is cut. No raw or exposed edges. No chance for rust ever to get a foothold. And the patented Edwards Interlocking Device, which allows for expansion and contraction, gives **PERMANENTLY water-tight** joints.

Edwards STEEL Shingles

Get Prices As to prices, these **STEEL** Shingles are far below wood. For we sell direct from factory to user and pay the freight ourselves. Just get our latest Steel Shingle Books and Prepaid Factory Prices. Then **compare.** Then see if you can afford common wood shingles when you can buy genuine Edwards **STEEL** Shingles at these prices. Give dimensions of your roof if possible, so we can quote price on entire job. Send postal today and our Catalog 876 and Prices will reach you by return mail.

CORN HARVESTER with Binder Attachment cuts and throws in piles on harvester or winrow. Man and horse cuts and shocks equal with a corn Binder. Sold in every state. Price $20.00. W. H. BUXTON, of Johnstown, Ohio, writes: "The Harvester has proven all you claim for it; the Harvester saved me over $25.00 in labor last year's corn cutting. I cut over 500 shocks; will make 4 bushels corn to a shock." Testimonials and catalog free, showing pictures of harvester. Address **NEW PROCESS MFG. CO., SALINA, KAS.**

few days eliminated shipping demand and the market took on an easier tone. Packers, however, have been unable to get the general price below $9, and it looks as though that level will remain for some time. The average weight is on the decrease, and that fact with no increase in the supply of pigs coming indicates that the supply of marketable hogs in the country is being depleted rapidly. Packers would like lower prices, but such a move would greatly curtail the movement. Farmers are holding their young pigs, as well as the older stock hogs. This should cause a fairly large early winter movement. St. Louis, St. Joseph and Kansas City are open markets for stock hogs now. Hogs that have been received at these yards, and have been immunized, can be shipped back to the country again for stock and feeding purposes.

The following quotations are for hogs:

Choice, 250@200 lbs.	$8.85@9.00
Choice, 200@245 lbs.	8.90@9.05
Medium weight.	8.90@9.05
Light weight.	8.50@9.05
Common to fair.	8.00@8.80
Stags.	7.50@9.00
Boars.	4.50@6.75
Bulk of sales	8.90@9.00

The following table shows prices for hogs in Kansas City in the past two weeks:

Mon., July 28	$8.90@9.05	$9.00@9.20
Tuesday.	8.90@9.05	8.95@9.17½
Wednesday.	8.85@9.05	8.95@9.12½
Thursday.	8.95@9.20	8.90@9.12½
Friday.	8.90@9.07	9.00@9.25
Saturday.	8.95@9.05	9.00@9.25

Sheep Prices Fluctuate One Dollar.

In the past two weeks lamb prices have covered the circuit between $7 to $8, the low point being $7, and the high point $8. In the past two days the market took an intermediate ground with top lambs $7.40. The movement of range sheep has begun. Chicago and Omaha have received consignments from Montana and Kansas City has had supplies from Utah and Colorado. Killers are anticipating an unusual large per cent of killing sheep this year from the range movement. The open pastures have been unusually good and flock masters are in a position to hold off until fall before shipping if prices become unsatisfactory. Feeder buyers are waiting for thin offerings, and a good fall demand is anticipated. Choice fat lambs are quoted at $6.75@7.40, yearlings $5@5.50, wethers $4.25@4.75, ewes $4@4.25. Feeding lambs will bring $5.25@6.25.

UNITED STATES' SHARE IN MEAT SUPPLY OF THE WORLD.

The total value of meats and food animals entering international trade is, according to the latest figures of the Bureau of Foreign and Domestic Commerce, Department of Commerce, approximately 450 million dollars per annum, of which about one-third is from the United States, and consists chiefly of pork and pork products.

While the total value of meat products and food animals exported from the United States in the year which ends with this month will be but about 150 million dollars, against approximately 250 million in 1906, this reduced total far exceeds that of any other country. Meats and food animals exported from Argentina in 1912 amounted to but 67 million dollars in value; from Australia, in 1911, 31 million; from New Zealand, 21 million; from Canada, 14 million; and from Uruguay, 11 million. These six countries—the United States, Argentina, Australia, New Zealand, Canada and Uruguay—are the chief meat exporting countries of the world. It will be seen from these figures that our meat exports are not only larger than those of any other country, but actually exceed the aggregate of our five principal rivals. The fall in our exports of meats and food animals, which has characterized recent years, has occurred chiefly in beef; pork products, always an important factor in the meat exports, show but a slight reduction.

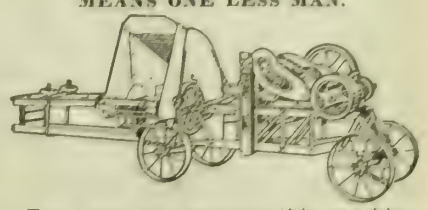
The United States still has, despite the reduction in her live stock in recent years, a larger number of food animals than any other country of the world. Of cattle alone, the number in the United States is 56 million, the only country having a larger number being India, with 113 million, while Russia in Europe and Asia has 51 million; Argentina, 29 million; Brazil, 25 million; Germany, 21 million; and the United Kingdom, 12 million. These figures are in round terms and for the latest available year. Of sheep, the United States has 54 million; Australia, 92 million; Russia, 85 million; Argentina, 67 million; the United Kingdom, 30 million; India, 26 million; Uruguay, 26 million; and New Zealand, 24 million. Of swine, the United States has 61 million; Russia, 13 million; and Germany, 22 million. The total number of food animals (including in this term merely cattle, sheep and hogs) was, at the latest available date, in the United States, 169 million; Russia in Europe and Asia, 149 million; India, 140 million; Australia, 104 million; Argentina, 98 million; Germany, 51 million; the United Kingdom, 46 million; and France, 39 million.

CONCERNING DAIRY SHORTHORNS.

To the American Breeder:—I would like to be informed through your paper where I can get some dairy Shorthorn cattle.—Peter Clemens, Harney County, Oregon.

The above inquiry, just received, represents a demand which is so general that we believe it justifies comment. As we have a number of other readers who have inquired about dairy Shorthorn cattle, we will ask all those who really have stock of this sort for sale to communicte direct with us. In replying to Mr. Clemen's inquiry we hope to get some information as to what has actually been done in the way of milk production in the herds of those who answer.

We noticed that serveral years ago when the demand became active for cows that would produce good feeding steers or good milking heifers, as the case might be, some breeders immediately claimed to have dairy Shorthorns in their herds, who a few years before had been claiming to have the "low down, blocky type" of beef animals. Now everyone of much experience with Shorthorn cattle knows that both good and poor milkers are to be found in nearly all Shorthorn herds. It is also true that a great many herds which have not been real carefully culled, contain cattle which flesh easily, and also those which fatten only with difficulty.



Now the fact that a cow stays thin and in that respect may somewhat resemble a Holstein, is no evidence that she is a good milker. In the first place, a cow to be a good milker must be strong and vigorous and be a hearty eater. It takes food to make milk. An extremely heavy milker must have the ability to consume and digest large quantities of food. A family of Shorthorns in which this ability is a prevailing characteristic is very likely to produce both good feeders and good milkers. If they are real dairy Shorthorns the cows will stay in milk a long time, and as long as they are giving milk, will, as a rule, show no great tendency to lay on flesh. As soon as they are dry, however, they fatten quickly, and steers from such cows are almost always excellent feeders. They may not have the very best beef type, but their habit of hearty eating and their power of digestion, will generally make up for what they may lack in the way of perfect beef form. Any man who has fed steers for any length of time will agree that it is the quiet, yet vigorous steers which are always chewing away at something that, as a rule, make the best profits.

Now we have outlined above something of what can be expected in a real milking Shorthorn. The writer has many times seen this kind in herds which did not make a pretension of being dairy Shorthorn herds. These cows were nearly always in nice condition when dry and were nearly always regular and persistent breeders. Where there is no occasion for milking them, two calves are often put on, and often both calves raised to weaning time almost fat enough for show purposes. The writer recalls two or three cases where such cows produced twin calves and raised them so well that one or more of each pair were shown successfully.

It is one of the greatest misfortunes which have come to any breed that some breeder of means and ability has not long ago built up a herd of just such cattle. The intrinsic value of cows like the above described (leaving entirely out of the question the possibility of twin production) is easily double the average value of

BINDER Attachment with Corn Harvester cuts and throws in piles on harvester or winrows. Man and horse cuts and shocks equal with a Corn Binder. Sold in every state. Price $20.00. W. H. BUXTON, of Johnstown, Ohio, writes: "The Harvester has proven all you claim for it; the Harvester saved me over $25 in labor last year's corn cutting. I cut over 500 shocks; will make 4 bushels corn to a shock." Testimonials and catalog free, showing pictures of harvester. Address

NEW PROCESS MFG. CO., Salina, Kas.

the other animals in the herds where they occur.

There is no fiction about the assertion that the Shorthorn breed contains wonderful material for real dual purpose cattle, but there is often a great deal of fiction in claims of dairy ability made for Shorthorns simply because they are disposed to stay in thin condition, or appear to have what might be called "dairy form."

HOG CHOLERA SERUM IS TESTED.

According to information sent out by the Kansas Agricultural College, every drop of hog cholera serum made at the agricultural college is thoroughly tested before it is sent out. Six susceptible hogs are inoculated with cholera germs. Twice as much infected blood is injected into these animals as they ever would get by vaccination. Two of these test pigs are vaccinated with a normal dose of the serum; two with three-fourths the normal amount, and two receive no serum. If the two not receiving serum die of cholera in the usual time, and the four receiving serum live and show no signs of ailment, the serum is counted satisfactory. If the pigs receiving three-fourths the normal dose develop fever the serum is not counted satisfactory, but its protective power is raised by adding to it some stronger blood. If all the pigs, inoculated and uninoculated, show cholera and die, the serum is judged worthless and is thrown away. Thus, all the serum sent out has a protective power double that which is required, if directions are followed.

GESTATION RECORDS OF FOURTEEN YEARS.

To the Amercian Breeder:—I read the letter of the Colorado breeder who wants to know which stallion sired the colt. I have had some 14 years' experience with stallions and jacks, and have kept a complete record of all mares bred. Here is the record of my old standard bred mare and time she carried each colt. Eleven months and 24 days she dropped a filly colt; 11 months and 21 days dropped a filly colt; 12 months and five days dropped a filly colt; 11 months and 15 days dropped a horse colt; 11 months and 19 days dropped a horse colt; 12 months and 6 days dropped a filly colt. Another draft mare carried her colt 10 months and 14 days and dropped a filly and the next year 10 months and 17 days and dropped a horse colt; this year 10 months and 21 days and dropped a filly. My brother had a mare least year bred but one time and carried the colt, a mule, 13 months and one day. The average for a period of 14 years for all mares bred to my horses and jacks, has been 11 months and 13 days. This covers the extremes, from 10 months and 14 days to 13 months and one day. No doubt, others have had like experiences.—Dan Diehl, Kiowa County, Okla.

AS A RHODE ISLAND BREEDER SEES IT.

To the American Breeder:—In regard to Mr. W. P. Dickson's question in the American Breeder of July 20th, he did not state whether mare No. 1 was served with the jack or horse first. If she was served with the jack first, it would be possible for the horse to get some of the jack's spermatozoa on his penis, and then when he served mare No. 2, he could have deposited the jack's spermatozoa with his own. As a jack's spermatozoa is apt to be more active than that of a horse, it is easy to see why she had a mule colt. If it was the horse's second cover within a short while, it is doubtful if he deposited many spermatozoa, if any, but probably just liquor seminis. If mare No. 1 was served with the horse first, I can see no way for mare No. 2 to have a mule colt. In other words, she must have come in contact with a jack, as the spermatozoa of a horse in a mare will not produce a mule.—E. J. Cole, Providence County, R. I.

HORSE MEN TO MEET.

On Monday morning, August 11, many horse men will assemble at the Graham Scientific Breeding School. In this gathering will be represented all ages and classes of men who wish to be more proficient in their given profession. Some of these men will be here for the second or third term. Their experiences are valuable to the new students. A special invitation is always extended to graduates to return at any future term free of cost. Some students take this means of having a profitable vacation. There are quite a few men who aim to attend one term each year. The average student is very anxious to know that nearly all of the students are able to pass the examinations and receive their diplomas at the first term, but after one term has been attended practically every one expresses a desire to attend again as soon as convenient.

There is a pleasure and recreation connected with this work that cannot be described on paper. A large body of practical horse men enjoy themselves together immensely. The experience meetings are always interesting and valuable. Different breeders will tell how they conduct their business and what has been profitable, as well as unprofitable. It is not difficult to get men to talk at a meeting of this kind, but it is hard to get them to write.

There never was a school where aged men took so much interest in the studies, that we know of. As the instructors work, a particular case will be recalled to the student's mind, and he sees the cause of some difficulty he has encountered. The dissecting of mares is interesting, especially since every student is required to perform his part of the work. Actual work in dissecting mares and making examinations on live barren mares, are important features. But from the first (Monday morning), the class is brought step by step so that when the entire week is over the students have acquired a wonderful lot of practical knowledge.

This will be the only term of school held until December. There will not be any fall breeding school. Nearly any breeder can attend this August term of school and make more than enough extra money out of his fall breeding season to pay all the expenses, besides having this knowledge for life and the satisfaction of being classed as an expert.—Adv.

$300,000 WORTH OF HORSES LANDED.

A new York dispatch tells of the arrival recently of liner Minnetonka, carrying 140 horses valued at $300,000. Of the total number 88 were Percherons, consigned to western importing firms. The balance were other draft breeds and light, including 16 show horses from one of the Vanderbilt stables.

QUESTIONS AND ANSWERS

(Continued from page 5.)

LAME JACK—I have a jack that became lame in his left hind leg about three weeks ago, and the ankle seems to be swollen a little, but not much; he walks on it, but limps. I think he kicked the barn. Would that make him lame? There is no hair off or no signs of being bruised. What would you advise putting on it?—New Mexico Subscriber.

REPLY—An injury of this nature of three weeks standing is best treated with a vesciant. The following is advised: Powdered cantharides one ounce, biniodide of mercury one dram, vaseline four ounces. Mix all together thoroughly and after clipping the hair closely from the parts, apply the blistering agent with the fingers, rubbing briskly for several minutes. Permit to remain on for 24 hours, at the end of which time wash off with hot water and soap, and when dry apply a little olive oil. Repeat the blister in about three weeks. Tie the animal up at each blistering period so that it cannot contact the parts with its nose.

OEDEMA—I would like to know what is the matter with my filly. My filly was three years old Easter Sunday, 1913. I bred her October, 1912; she weighed 1,100 pounds. She is very heavy now and there is a swelling coming on the left side of the navel; her bag has been coming and going

Jacks and Jennets

PAGE AVENUE JACK AND JENNET FARM.

Fine jacks, from yearlings up, for sale. As good a bunch as anybody has got. Aged jacks fit for herd headers—two of them as good as grow. Visit our barns and see for yourself, and buy the best in the land.

J. R. REYNOLDS & SON, GUTHRIE, MO.

FAIRVIEW JACK AND JENNET FARM

32 Jacks and 35 Jennets, the best that grow, 14½ to 16½ hands high—jacks with lots of bone and substance. Everything guaranteed as represented. Prices right. Address

J. C. HUCKSTEP, Eolia, Pike County, Mo.

KENTUCKY JACK FARM

Established in 1884.

A fine lot of black Mammoth Kentucky jacks. Big bone and plenty of weight. Will sell at special prices in order to make room for young stock. We sell more jacks to the Western trade than any breeder in Kentucky. Write for prices or come and see me. Guarantee to please our customers.

Joe E. Wright, Junction City, Ky.

JACKS.

20 good black jacks and some good jennets; coming 3 to coming 8 years old. Large, heavy boned, broken to mares and prompt servers. Prices reasonable. Come and see me. Barns 2 miles from town.

BARGAINS! **I am cleaning up my stock of Big Jacks and Draft Stallions**

And am making the lowest prices you ever heard of for stock as good.

Just come here, pick out what you want and if you don't buy it won't be the fault of the price.

I don't believe in having any good, serviceable stock left when the season ends, and this is the way I keep from it. Come and see.

W. J. Finley, Higginsville, Mo.

Hotel Convention **12th and Broadway, Kansas City** Mo. Large, airy rooms, good beds. Special rates to students of the Graham Scientific Breeding School. Two persons in one full bed, 35c per day each. One person in a full bed, 60c per day. Good restaurants in connection and nearby. Take Observation Park street car from in front of Union Depot direct to our corner. Only a few minutes' walk to the school building.

for the last month. There is no veterinarian in this part of the country. She is so large and heavy and the swelling coming, I am afraid of losing her. Is fed nothing, is running on pasture and has not been worked for the past two months. Do you think I am likely to have trouble with her? and what kind? and what to do?—New Mexico Subscriber.

REPLY—These cases do not ordinarily cause serious trouble, as it is a frequent occurrence for mares heavy with foal to become swollen under the belly on account of the obstructed circulation. As long as the udder remains in good condition, and does not become inflammed, we would advise that you continue to allow your filly the run of a pasture, so as to insure exercise, and we believe after the foaling period this swelling will gradually disappear.

BREEDING QUESTION—A mare was brought to my place, 16 years old; was very tight at both vagina and womb; she seemed to be in heat. I suggested to the owner to bring her back in two days and that she might be more open. He did so and she was a little more open, but she bled slightly each time I examined her. The owner would not take the risk of injuring the mare, so I did not breed her. Did I do right? Was there a risk? Can she be bred with capsule? Or how would it do to use the syringe to put the semen into the womb when it is so tight?—Ohio Subscriber.

REPLY—If this mare has not been producing regularly she will likely prove a shy breeder on account of her age. If the cervix will not dilate readily she may be bred safely with the syringe, as you suggest.

HEAVY HORSES.

PERCHERON MARES TO TRADE FOR GOOD WORK MULES.

I have five registered Percheron mares, all bred to good registered stallion, and I need instead for clearing up a large tract of new land, mules weighing close to 1,200 pounds and preferably 3 years old. Will trade the mares or sell mares and buy mules.

Fred Pollman, LaCygne, Kas.

PERCHERONS.

Imported and home bred stallions and mares, from $200 to $900 each. **H. Redenius, Rushmore, Nobles County, Minn.**

$300 BUYS

Jim Erastus, registered Percheron stallion; 13 years old; black; sound; gentle; right every way; weight 2,200 pounds. Good breeder. Sell because of too many fillies. Also two, three year old German Coach horses.

W. H. RHAMEY, Lakeville, Ohio.

150 STALLIONS.

Imported and home-bred stallions. I guarantee to sell you stallions for less money than any firm in America. Come to a Live Horse Market and see all draft breeds. Reference, any Bank in Creston. **A. Latimer Wilson, Creston, Iowa.**

CLYDESDALE HORSES

Stallions and mares of all ages for sale.

Also Shorthorn Cattle.

W. A. DeMerritt

Route 2, Plainfield, Ill.

SPAN OF PERCHERON MARES

For sale. Full bloods; seven years old; colts by side two months old. Mares in foal again to one of the best Percheron stallions in the state of Iowa. Will consider a good single, gentle driving horse that can go a mile in 2:35 or better, any day, as part pay. Good reasons for selling. This ad will only appear once. Address

BOX 412, TRAER, IOWA.

IMPORTED AND HOME BRED STALLIONS AND MARES.

PERCHERONS, BELGIANS, SHIRES.

The best importation we ever made is now in our barns ready for inspection. The mares include some of the best fillies that came out of the Perche this year. See what we have before buying elsewhere. **Address Hart Bros., Osceola, Iowa.**

AZOTURIA—I bred a mare with the capsule. The owner did not tell me that she had had the azoturia just previous. To me she looked well. The next day she was sick and had great difficulty in passing water; she swelled up considerably from knees down. It took about two weeks for her to recover. The mouth of womb was very tight; had great difficulty in inserting the capsule. Was I to blame in causing her sickness? Where was my mistake?—Ohio Subscriber.

REPLY—Perhaps this mare should not have been bred so early after an attack of azoturia, but it was the owner's fault that you were not informed about her condition. The difficulty of inserting the capsule was likely responsible for a little local irritation, which accounted for the straining. We do not see any reason why the difficulty mentioned in the fore limbs should develop from the breeding experience and are inclined to think it was from other causes.

BROKEN WIND—I own a standard bred stallion, eight years old; he is sound except his glands which were affected by distemper when two years old makes him wheeze loud. Is there any remedy for him?—Ohio Subscriber.

REPLY—We shall not attempt to prescribe for an animal that has been affected for six years. Broken wind may be occasioned by quite a variety of causes and you are in need of a competent man who can submit this horse to a variety of tests before advising you as to whether he is curable or not. Get the advice of the best veterinarian you can command.

HIP SWEENY—Please give me a remedy for hip sweeny of horse. Is hip sweeny most generally curable?—Tennessee Subscriber.
